# 11. Integrals of Bessel Functions

## Mathematical Properties

### 11.1. Simple Integrals of Bessel Functions

$$\underline{\int_0^z t^\mu J_\nu(t)dt}$$

**11.1.1**

$$\int_0^z t^\mu J_\nu(t)dt=\frac{z^\mu\Gamma\left(\frac{\nu+\mu+1}{2}\right)}{\Gamma\left(\frac{\nu-\mu+1}{2}\right)}$$
$$\times\sum_{k=0}^\infty\frac{(\nu+2k+1)\Gamma\left(\frac{\nu-\mu+1}{2}+k\right)}{\Gamma\left(\frac{\nu+\mu+3}{2}+k\right)}J_{\nu+2k+1}(z)$$
$$(\mathscr{R}(\mu+\nu+1)>0)$$

**11.1.2**

$$\int_0^z J_\nu(t)dt=2\sum_{k=0}^\infty J_{\nu+2k+1}(z)\;(\mathscr{R}\nu>-1)$$

**11.1.3** $$\int_0^z J_{2n}(t)dt=\int_0^z J_0(t)dt-2\sum_{k=0}^{n-1}J_{2k+1}(z)$$

**11.1.4** $$\int_0^z J_{2n+1}(t)dt=1-J_0(z)-2\sum_{k=1}^{n}J_{2k}(z)$$

#### Recurrence Relations

**11.1.5**

$$\int_0^z J_{n+1}(t)dt=\int_0^z J_{n-1}(t)dt-2J_n(z)\qquad(n>0)$$

**11.1.6** $$\int_0^z J_1(t)dt=1-J_0(z)$$

$$\underline{\int J_0(t)dt,\int Y_0(t)dt,\int I_0(t)dt,\int K_0(t)dt}$$

**11.1.7**

$$\int_0^x\mathscr{C}_0(t)dt=x\mathscr{C}_0(x)+\frac{1}{2}\pi x\{\mathbf{H}_0(x)\mathscr{C}_1(x)-\mathbf{H}_1(x)\mathscr{C}_0(x)\}$$
$$\mathscr{C}_\nu(x)=AJ_\nu(x)+BY_\nu(x),\nu=0,1$$

$A$ and $B$ are constants.

**11.1.8**

$$\int_0^x Z_0(t)dt=xZ_0(x)+\frac{1}{2}\pi x\{-\mathbf{L}_0(x)Z_1(x)+\mathbf{L}_1(x)Z_0(x)\}$$
$$Z_\nu(x)=AI_\nu(x)+Be^{i\nu\pi}K_\nu(x),\nu=0,1$$

$A$ and $B$ are constants.

$\mathbf{H}_\nu(x)$ and $\mathbf{L}_\nu(x)$ are Struve functions (see chapter 12).

**11.1.9**

$$\int_0^x K_0(t)dt=-\left(\gamma+\ln\frac{x}{2}\right)x\sum_{k=0}^\infty\frac{(x/2)^{2k}}{(k!)^2(2k+1)}$$
$$+x\sum_{k=0}^\infty\frac{(x/2)^{2k}}{(k!)^2(2k+1)^2}$$
$$+x\sum_{k=1}^\infty\frac{(x/2)^{2k}}{(k!)^2(2k+1)}\left(1+\frac{1}{2}+\ldots+\frac{1}{k}\right)$$

$\gamma$ (Euler's constant)$=.57721\ 56649\ \ldots$

In this and all other integrals of **11.1,** $x$ is real and positive although all the results remain valid for extended portions of the complex plane unless stated to the contrary.

**11.1.10**

$$\int_0^{-ix}K_0(t)dt=\frac{\pi}{2}\int_0^x J_0(t)dt+i\frac{\pi}{2}\int_0^x Y_0(t)dt$$

#### Asymptotic Expansions

**11.1.11**

$$\int_x^\infty[J_0(t)+iY_0(t)]dt\sim\left(\frac{2}{\pi x}\right)^{\frac{1}{2}}e^{i(x-\pi/4)}$$
$$\times\left[\sum_{k=0}^\infty(-)^k a_{2k+1}x^{-2k-1}+i\sum_{k=0}^\infty(-)^k a_{2k}x^{-2k}\right]$$

**11.1.12** $$a_k=\frac{\Gamma(k+\frac{1}{2})}{\Gamma(\frac{1}{2})}\sum_{s=0}^k\frac{\Gamma(s+\frac{1}{2})}{2^s s!\Gamma(\frac{1}{2})}$$

**11.1.13**

$$2(k+1)a_{k+1}=3\left(k+\frac{1}{2}\right)\left(k+\frac{5}{6}\right)a_k$$
$$-\left(k+\frac{1}{2}\right)^2\left(k-\frac{1}{2}\right)a_{k-1}$$

**11.1.14** $$x^{\frac{1}{2}}e^{-x}\int_0^x I_0(t)dt\sim(2\pi)^{-\frac{1}{2}}\sum_{k=0}^{\infty}a_kx^{-k}$$

where the $a_k$ are defined as in **11.1.12.**

**11.1.15** $$x^{\frac{1}{2}}e^{x}\int_x^{\infty} K_0(t)dt\sim\left(\frac{\pi}{2}\right)^{\frac{1}{2}}\sum_{k=0}^{\infty}(-)^ka_kx^{-k}$$

where the $a_k$ are defined as in **11.1.12.**

### Polynomial Approximations[2]

**11.1.16** $8\leq x\leq\infty$

$$\int_x^{\infty}[J_0(t)+iY_0(t)]dt$$

$$=x^{-\frac{1}{2}}e^{i(x-\pi/4)}\left[\sum_{k=0}^{7}(-)^ka_k(x/8)^{-2k-1}\right.$$

$$\left.+i\sum_{k=0}^{7}(-)^kb_k(x/8)^{-2k}+\epsilon(x)\right]$$

$$|\epsilon(x)|\leq2\times10^{-9}$$

| $k$ | $a_k$ | $b_k$ |
|---|---|---|
| 0 | .06233 47304 | .79788 45600 |
| 1 | .00404 03539 | .01256 42405 |

| 2 | .02576 646 |
| 3 | .00933 994 |
| 4 | .00417 454 |
| 5 | .00163 271 |
| 6 | .00033 934 |

### $\int\frac{J_0(t)dt}{t},\int\frac{Y_0(t)dt}{t},\int\frac{K_0(t)dt}{t}$

**11.1.19**

$$\int_0^x\frac{1-J_0(t)}{t}\,dt$$

$$=2x^{-1}\sum_{k=0}^{\infty}(2k+3)[\psi(k+2)-\psi(1)]\,J_{2k+3}(x)$$

$$=1-2x^{-1}J_1(x)$$

$$+2x^{-1}\sum_{k=0}^{\infty}(2k+5)[\psi(k+3)-\psi(1)-1]J_{2k+5}(x)$$

For $\psi(z)$, see **6.3.**

**11.1.20**

$$\int_x^{\infty}\frac{J_0(t)dt}{t}+\gamma+\ln\frac{x}{2}=\int_0^x\frac{[1-J_0(t)]dt}{t}$$

$$=-\sum_{k=1}^{\infty}\frac{(-)^k\left(\frac{x}{2}\right)^{2k}}{2k(k!)^2}$$

**11.1.21**

$$\int_x^{\infty}\frac{Y_0(t)dt}{t}=-\frac{1}{\pi}\left(\ln\frac{x}{2}\right)^2-\frac{2\gamma}{\pi}\left(\ln\frac{x}{2}\right)+\frac{1}{\pi}\left(\frac{\pi^2}{6}-\gamma^2\right)$$

$$+\frac{2}{\pi}\sum_{k=1}^{\infty}\frac{(-)^k\left(\frac{x}{2}\right)^{2k}}{2k(k!)^2}\left\{\psi(k+1)+\frac{1}{2k}-\ln\frac{x}{2}\right\}$$

**11.1.22**

$$\int_x^{\infty}\frac{K_0(t)dt}{t}=\frac{1}{2}\left(\ln\frac{x}{2}\right)^2+\gamma\ln\frac{x}{2}+\frac{\pi^2}{24}+\frac{\gamma^2}{2}$$

$$-\sum_{k=1}^{\infty}\frac{\left(\frac{x}{2}\right)^{2k}}{2k(k!)^2}\left\{\psi(k+1)+\frac{1}{2k}-\ln\frac{x}{2}\right\}$$

**11.1.23**

$$\int_{-ix}^{-i\infty}\frac{K_0(t)dt}{t}=\frac{i\pi}{2}\int_x^{\infty}\frac{J_0(t)dt}{t}-\frac{\pi}{2}\int_x^{\infty}\frac{Y_0(t)dt}{t}$$

---

[2] Approximation **11.1.16** is from A. J. M. Hitchcock. Polynomial approximations to Bessel functions of order zero and one and to related functions, Math. Tables Aids Comp. 11, 86–88 (1957) (with permission).

### Asymptotic Expansions

**11.1.24** $$\int_x^\infty \frac{\mathscr{C}_0(t)dt}{t} = \frac{2g_1(x)\mathscr{C}_0(x)}{x^2} - \frac{g_0(x)\mathscr{C}_1(x)}{x}$$

where

$$g_0(x) \sim \sum_{k=0}^{\infty} (-)^k \left(\frac{x}{2}\right)^{-2k} (k!)^2,$$

$$g_1(x) \sim \sum_{k=0}^{\infty} (-)^k \left(\frac{x}{2}\right)^{-2k} k!(k+1)!$$

**11.1.25** $$g_0(x) = 2x^2 \int_x^\infty \frac{g_1(t)dt}{t^3}$$

**11.1.26** $$x^{3/2}e^x \int_x^\infty \frac{K_0(t)dt}{t} \sim \left(\frac{\pi}{2}\right)^{\frac{1}{2}} \sum_{k=0}^{\infty} (-)^k c_k x^{-k}$$

where

**11.1.27** $$c_0 = 1, c_1 = \frac{13}{8}$$

$$2(k+1)c_{k+1} = \left[3(k+1)^2 + \frac{1}{4}\right]c_k - \left(k+\frac{1}{2}\right)^3 c_{k-1}$$

**11.1.28** $$x^{3/2}e^{-x} \int_0^x \frac{[I_0(t)-1]dt}{t} \sim (2\pi)^{-\frac{1}{2}} \sum_{k=0}^{\infty} c_k x^{-k}$$

where $c_k$ is defined as in **11.1.27.**

### Polynomial Approximations

**11.1.29** $5 \leq x \leq \infty$

$$\int_x^\infty \frac{\mathscr{C}_0(t)dt}{t} = \frac{2g_1(x)\mathscr{C}_0(x)}{x^2} - \frac{g_0(x)\mathscr{C}_1(x)}{x}$$

where

$$g_0(x) = \sum_{k=0}^{9} (-)^k a_k (x/5)^{-2k} + \epsilon(x),$$

$$g_1(x) = \sum_{k=0}^{9} (-)^k b_k (x/5)^{-2k} + \epsilon(x)$$

$$|\epsilon(x)| \leq 2 \times 10^{-7}$$

## 11.2. Repeated Integrals of $J_n(z)$ and $K_0(z)$

### Repeated Integrals of $J_n(z)$

Let

**11.2.1**

$$f_{0,n}(z) = J_n(z),$$

$$f_{1,n}(z) = \int_0^z J_n(t)dt, \ldots, f_{r,n}(z) = \int_0^z f_{r-1,n}(t)dt$$

**11.2.2** $$f_{-r,n}(z) = \frac{d^r}{dz^r} J_n(z)$$

Then

**11.2.3**

$$f_{r,n}(z) = \frac{1}{\Gamma(r)} \int_0^z (z-t)^{r-1} J_n(t)dt \quad (\mathscr{R}r > 0)$$

**11.2.4** $$f_{r,n}(z) = \frac{2^r}{\Gamma(r)} \sum_{k=0}^{\infty} \frac{\Gamma(k+r)}{k!} J_{n+r+2k}(z)$$

**Recurrence Relations**

**11.2.5**

$$r(r-1)f_{r+1,n}(z)=2(r-1)zf_{r,n}(z)$$
$$-[(1-r)^2-n^2+z^2]f_{r-1,n}(z)$$
$$+(2r-3)zf_{r-2,n}(z)-z^2f_{r-3,n}(z)$$

**11.2.6**

$$rf_{r+1,0}(z)=zf_{r,0}(z)-(r-1)f_{r-1,0}(z)+zf_{r-2,0}(z)$$

**11.2.7** $$f_{r+1,n+1}(z)=f_{r+1,n-1}(z)-2f_{r,n}(z)$$

**Repeated Integrals of $K_0(z)$**

Let

**11.2.8**

$$\mathrm{Ki}_0(z)=K_0(z),$$
$$\mathrm{Ki}_1(z)=\int_z^\infty K_0(t)dt,\ \ldots,\ \mathrm{Ki}_r(z)=\int_z^\infty \mathrm{Ki}_{r-1}(t)dt$$

**11.2.9** $$\mathrm{Ki}_{-r}(z)=(-)^r\frac{d^r}{dz^r}K_0(z)$$

Then

**11.2.10**

$$\mathrm{Ki}_r(z)=\int_0^\infty \frac{e^{-z\cosh t}\,dt}{\cosh^r t}$$
$$(\mathscr{R}z\geq 0,\ \mathscr{R}r>0,\ \mathscr{R}z>0,\ r=0)$$

**11.2.11**

$$\mathrm{Ki}_r(z)=\frac{1}{\Gamma(r)}\int_z^\infty (t-z)^{r-1}K_0(t)dt$$
$$(\mathscr{R}z\geq 0,\ \mathscr{R}r>0)$$

**11.2.12** $$\mathrm{Ki}_{2r}(0)=\frac{\Gamma(r)\Gamma(\frac{3}{2})}{\Gamma(r+\frac{1}{2})}\qquad(\mathscr{R}r>0)$$

**11.2.13** $$\mathrm{Ki}_{2r+1}(0)=\frac{\frac{\pi}{2}\,\Gamma(r+\frac{1}{2})}{\Gamma(\frac{1}{2})\Gamma(r+1)}\qquad\left(\mathscr{R}r>-\frac{1}{2}\right)$$

**11.2.14**

$$r\mathrm{Ki}_{r+1}(z)=-z\mathrm{Ki}_r(z)+(r-1)\mathrm{Ki}_{r-1}(z)+z\mathrm{Ki}_{r-2}(z)$$

## 11.3. Reduction Formulas for Indefinite Integrals

Let

**11.3.1** $$g_{\mu,\nu}(z)=\int^z e^{-pt}t^\mu Z_\nu(t)dt$$

where $Z_\nu(z)$ represents any of the Bessel functions of the first three kinds or the modified Bessel functions. The parameters $a$ and $b$ appearing in the reduction formulae are associated with the particular type of Bessel function as delineated in the following table.

**11.3.2**

| $Z_\nu(z)$ | $a$ | $b$ |
|---|---|---|
| $J_\nu(z),\ Y_\nu(z),\ H_\nu^{(1)}(z),\ H_\nu^{(2)}(z)$ | $1$ | $1$ |
| $I_\nu(z)$ | $-1$ | $1$ |
| $K_\nu(z)$ | $1$ | $-1$ |

**11.3.3**

$$pg_{\mu,\nu}(z)=-e^{-pz}z^\mu Z_\nu(z)$$
$$+(\mu+\nu)g_{\mu-1,\nu}(z)-ag_{\mu,\nu+1}(z)$$

**11.3.4**

$$pg_{\mu,\nu+1}(z)=-e^{-pz}z^\mu Z_{\nu+1}(z)$$
$$+(\mu-\nu-1)g_{\mu-1,\nu+1}(z)+bg_{\mu,\nu}(z)$$

**11.3.5**

$$(p^2+ab)g_{\mu,\nu}(z)=ae^{-pz}z^\mu Z_{\nu+1}(z)$$
$$+(\mu-\nu-1)e^{-pz}z^{\mu-1}Z_\nu(z)-pe^{-pz}z^\mu Z_\nu(z)$$
$$+p(2\mu-1)g_{\mu-1,\nu}(z)+[\nu^2-(\mu-1)^2]g_{\mu-2,\nu}(z)$$

**11.3.6**

$$a(\nu-\mu)g_{\mu,\nu+1}(z)=-2\nu e^{-pz}z^\mu Z_\nu(z)-2\nu pg_{\mu,\nu}(z)$$
$$+b(\mu+\nu)g_{\mu,\nu-1}(z)$$

**Case 1:** $p^2+ab=0,\ \nu=\pm(\mu-1)$

**11.3.7** $$g_{\nu,\nu}(z)=\frac{e^{-pz}z^{\nu+1}}{2\nu+1}\left\{Z_\nu(z)-\frac{a}{p}Z_{\nu+1}(z)\right\}$$

**11.3.8** $$g_{-\nu,\nu}(z)=-\frac{e^{-pz}z^{-\nu+1}}{2\nu-1}\left\{Z_\nu(z)+\frac{b}{p}Z_{\nu-1}(z)\right\}$$

**11.3.9**

$$\int_0^z e^{it}t^\nu J_\nu(t)dt=\frac{e^{iz}z^{\nu+1}}{2\nu+1}[J_\nu(z)-iJ_{\nu+1}(z)]$$
$$(\mathscr{R}\nu>-\tfrac{1}{2})$$

**11.3.10**

$$\int_0^z e^{it}t^{-\nu}J_\nu(t)dt=-\frac{e^{iz}z^{-\nu+1}}{2\nu-1}[J_\nu(z)+iJ_{\nu-1}(z)]$$
$$+\frac{i}{2^{\nu-1}(2\nu-1)\Gamma(\nu)}\qquad(\nu\neq\tfrac{1}{2})$$

**11.3.11**

$$\int_0^z e^{it}t^\nu Y_\nu(t)dt=\frac{e^{iz}z^{\nu+1}}{2\nu+1}[Y_\nu(z)-iY_{\nu+1}(z)]$$
$$-\frac{i2^{\nu+1}\Gamma(\nu+1)}{\pi(2\nu+1)}\qquad(\mathscr{R}\nu>-\tfrac{1}{2})$$

**11.3.12**

$$\int_0^z e^{\pm t}t^\nu I_\nu(t)dt=\frac{e^{\pm z}z^{\nu+1}}{2\nu+1}[I_\nu(z)\mp I_{\nu+1}(z)]$$
$$(\mathscr{R}\nu>-\tfrac{1}{2})$$

**11.3.13**

$$\int_0^z e^{-t}I_n(t)dt=ze^{-z}[I_0(z)+I_1(z)]$$
$$+n[e^{-z}I_0(z)-1]+2e^{-z}\sum_{k=1}^{n-1}(n-k)I_k(z)$$

**11.3.14**

$$\int_0^z e^{\pm t}t^{-\nu}I_\nu(t)dt=-\frac{e^{\pm z}z^{-\nu+1}}{2\nu-1}[I_\nu(z)\mp I_{\nu-1}(z)]$$
$$\mp\frac{1}{2^{\nu-1}(2\nu-1)\Gamma(\nu)} \qquad (\nu\neq\tfrac{1}{2})$$

**11.3.15**

$$\int_0^z e^{\pm t}t^{\nu}K_\nu(t)dt=\frac{e^{\pm z}z^{\nu+1}}{2\nu+1}[K_\nu(z)\pm K_{\nu+1}(z)]$$
$$\mp\frac{2^\nu\Gamma(\nu+1)}{2\nu+1} \qquad (\mathscr{R}\nu>-\tfrac{1}{2})$$

King's integral (see [11.5])

**11.3.16** $$\int_0^z e^tK_0(t)dt=ze^z[K_0(z)+K_1(z)]-1$$

**11.3.17**

$$\int_z^\infty e^tt^{-\nu}K_\nu(t)dt$$
$$=\frac{e^zz^{-\nu+1}}{2\nu-1}[K_\nu(z)+K_{\nu-1}(z)] \qquad (\mathscr{R}\nu>\tfrac{1}{2})$$

**Case 2:** $p=0, \mu=\pm\nu$

**11.3.18** $$bg_{\nu,\nu-1}(z)=z^\nu Z_\nu(z)$$

**11.3.19** $$ag_{-\nu,\nu+1}(z)=-z^{-\nu}Z_\nu(z)$$

**11.3.20** $$\int_0^z t^\nu J_{\nu-1}(t)dt=z^\nu J_\nu(z) \qquad (\mathscr{R}\nu>0)$$

**11.3.21** $$\int_0^z t^{-\nu}J_{\nu+1}(t)dt=\frac{1}{2^\nu\Gamma(\nu+1)}-z^{-\nu}J_\nu(z)$$

**11.3.22**

$$2n\int_0^z\frac{J_{2n}(t)dt}{t}=1-\frac{2}{z}\sum_{k=1}^{n}(2k-1)J_{2k-1}(z)$$
$$=\frac{2}{z}\sum_{k=n+1}^{\infty}(2k-1)J_{2k-1}(z) \qquad (n>0)$$

**11.3.23**

$$(2n+1)\int_0^z\frac{J_{2n+1}(t)dt}{t}=\int_0^z J_0(t)dt$$
$$-J_1(z)-\frac{4}{z}\sum_{k=1}^{n}kJ_{2k}(z)$$

**11.3.24**

$$\int_0^z t^\nu Y_{\nu-1}(t)dt=z^\nu Y_\nu(z)+\frac{2^\nu\Gamma(\nu)}{\pi} \qquad (\mathscr{R}\nu>0)$$

**11.3.25** $$\int_0^z t^\nu I_{\nu-1}(t)dt=z^\nu I_\nu(z) \qquad (\mathscr{R}\nu>0)$$

**11.3.26** $$\int_0^z t^{-\nu}I_{\nu+1}(t)dt=z^{-\nu}I_\nu(z)-\frac{1}{2^\nu\Gamma(\nu+1)}$$

**11.3.27**

$$\int_0^z t^\nu K_{\nu-1}(t)dt=-z^\nu K_\nu(z)+2^{\nu-1}\Gamma(\nu) \qquad (\mathscr{R}\nu>0)$$

**11.3.28** $$\int_z^\infty t^{-\nu}K_{\nu+1}(t)dt=z^{-\nu}K_\nu(z)$$

**Indefinite Integrals of Products of Bessel Functions**

Let $\mathscr{C}_\mu(z)$ and $\mathscr{D}_\nu(z)$ denote any two cylinder functions of orders $\mu$ and $\nu$ respectively.

**11.3.29**

$$\int^z\left\{(k^2-l^2)t-\frac{(\mu^2-\nu^2)}{t}\right\}\mathscr{C}_\mu(kt)\mathscr{D}_\nu(lt)dt$$
$$=z\{k\mathscr{C}_{\mu+1}(kz)\mathscr{D}_\nu(lz)-l\mathscr{C}_\mu(kz)\mathscr{D}_{\nu+1}(lz)\} \quad *$$
$$-(\mu-\nu)\mathscr{C}_\mu(kz)\mathscr{D}_\nu(lz)$$

**11.3.30**

$$\int^z t^{-\mu-\nu-1}\mathscr{C}_{\mu+1}(t)\mathscr{D}_{\nu+1}(t)dt$$
$$=-\frac{z^{-\mu-\nu}}{2(\mu+\nu+1)}\{\mathscr{C}_\mu(z)\mathscr{D}_\nu(z)+\mathscr{C}_{\mu+1}(z)\mathscr{D}_{\nu+1}(z)\}$$

**11.3.31**

$$\int^z t^{\mu+\nu+1}\mathscr{C}_\mu(t)\mathscr{D}_\nu(t)dt$$
$$=\frac{z^{\mu+\nu+2}}{2(\mu+\nu+1)}\{\mathscr{C}_\mu(z)\mathscr{D}_\nu(z)+\mathscr{C}_{\mu+1}(z)\mathscr{D}_{\nu+1}(z)\}$$

**11.3.32**

$$\int_0^z tJ^2_{\nu-1}(t)dt=2\sum_{k=0}^{\infty}(\nu+2k)J^2_{\nu+2k}(z) \qquad (\mathscr{R}\nu>0)$$

**11.3.33**

$$\int_0^z t[J^2_{\nu-1}(t)-J^2_{\nu+1}(t)]dt=2\nu J^2_\nu(z) \qquad (\mathscr{R}\nu>0)$$

**11.3.34** $$\int_0^z tJ_0^2(t)dt=\frac{z^2}{2}[J_0^2(z)+J_1^2(z)]$$

**11.3.35**

$$\int_0^z J_n(t)J_{n+1}(t)dt=\frac{1}{2}[1-J_0^2(z)]-\sum_{k=1}^{n}J_k^2(z)$$
$$=\sum_{k=n+1}^{\infty}J_k^2(z)$$

---

*See page II.

**11.3.36**

$$(\mu+\nu)\int^{z} t^{-1}\mathscr{C}_\mu(t)\mathscr{D}_\nu(t)dt \\ -(\mu+\nu+2n)\int^{z} t^{-1}\mathscr{C}_{\mu+n}(t)\mathscr{D}_{\nu+n}(t)dt \\ =\mathscr{C}_\mu(z)\mathscr{D}_\nu(z)+\mathscr{C}_{\mu+n}(z)\mathscr{D}_{\nu+n}(z)+2\sum_{k=1}^{n-1}\mathscr{C}_{\mu+k}(z)\mathscr{D}_{\nu+k}(z)$$

### Convolution Type Integrals

**11.3.37**

$$\int_0^z J_\mu(t)J_\nu(z-t)dt=2\sum_{k=0}^{\infty}(-)^k J_{\mu+\nu+2k+1}(z) \qquad (\mathscr{R}\mu>-1, \mathscr{R}\nu>-1)$$

**11.3.38**

$$\int_0^z J_\nu(t)J_{1-\nu}(z-t)dt=J_0(z)-\cos z \qquad (-1<\mathscr{R}\nu<2)$$

**11.3.39**

$$\int_0^z J_\nu(t)J_{-\nu}(z-t)\,dt=\sin z \qquad (|\mathscr{R}\nu|<1)$$

**11.3.40**

$$\int_0^z t^{-1}J_\mu(t)J_\nu(z-t)dt=\frac{J_{\mu+\nu}(z)}{\mu} \qquad (\mathscr{R}\mu>0, \mathscr{R}\nu>-1)$$

**11.3.41**

$$\int_0^z \frac{J_\mu(t)J_\nu(z-t)dt}{t(z-t)}=\frac{(\mu+\nu)J_{\mu+\nu}(z)}{\mu\nu z} \qquad (\mathscr{R}\mu>0, \mathscr{R}\nu>0)$$

## 11.4. Definite Integrals

### Orthogonality Properties of Bessel Functions

Let $\mathscr{C}_\nu(z)$ be a cylinder function of order $\nu$. In particular, let

**11.4.1** $\mathscr{C}_\nu(z)=AJ_\nu(z)+BY_\nu(z)$

where $A$ and $B$ are real constants. Then

**11.4.2**

$$\int_a^b t\mathscr{C}_\nu(\lambda_m t)\mathscr{C}_\nu(\lambda_n t)dt=0 \ (m\neq n)$$

$$=\left[\frac{1}{2}t^2\left\{\left(1-\frac{\nu^2}{\lambda_n^2 t^2}\right)\mathscr{C}_\nu^2(\lambda_n t)+\mathscr{C}_\nu'^2(\lambda_n t)\right\}\right]_a^b \qquad (m=n)(0<a<b)$$

provided the following two conditions hold:

1. $\lambda_n$ is a real zero of

**11.4.3** $h_1\lambda\mathscr{C}_{\nu+1}(\lambda b)-h_2\mathscr{C}_\nu(\lambda b)=0$

2. There must exist numbers $k_1$ and $k_2$ (both not zero) so that for all $n$

**11.4.4** $k_1\lambda_n\mathscr{C}_{\nu+1}(\lambda_n a)-k_2\mathscr{C}_\nu(\lambda_n a)=0$

In connection with these formulae, see **11.3.29.** If $a=0$, the above is valid provided $B=0$. This case is covered by the following result.

**11.4.5**

$$\int_0^1 tJ_\nu(\alpha_m t)J_\nu(\alpha_n t)dt=0 \qquad (m\neq n, \nu>-1)$$

$$=\tfrac{1}{2}[J_\nu'(\alpha_n)]^2 \qquad (m=n, b=0, \nu>-1)$$

$$=\frac{1}{2\alpha_n^2}\left[\frac{a^2}{b^2}+\alpha_n^2-\nu^2\right][J_\nu(\alpha_n)]^2 \qquad (m=n,\ b\neq 0,\ \nu\geq -1)$$

$\alpha_1, \alpha_2, \ldots$ are the positive zeros of $aJ_\nu(x)+bxJ_\nu'(x)=0$, where $a$ and $b$ are real constants.

**11.4.6**

$$\int_0^\infty t^{-1}J_{\nu+2n+1}(t)J_{\nu+2m+1}(t)dt=0 \qquad (m\neq n)$$

$$=\frac{1}{2(2n+\nu+1)} \qquad (m=n)(\nu+n+m>-1)$$

### Definite Integrals Over a Finite Range

**11.4.7** $\displaystyle\int_0^{\frac{\pi}{2}} J_{2n}(2z\sin t)dt=\frac{\pi}{2}J_n^2(z)$

**11.4.8** $\displaystyle\int_0^{\pi} J_0(2z\sin t)\cos 2nt dt=\pi J_n^2(z)$

**11.4.9** $\displaystyle\int_0^{\frac{\pi}{2}} Y_0(2z\sin t)\cos 2nt dt=\frac{\pi}{2}J_n(z)Y_n(z)$

**11.4.10**

$$\int_0^{\frac{\pi}{2}} J_\mu(z\sin t)\sin^{\mu+1}t\cos^{2\nu+1}t dt$$

$$=\frac{2^\nu\Gamma(\nu+1)}{z^{\nu+1}}J_{\mu+\nu+1}(z) \qquad (\mathscr{R}\mu>-1, \mathscr{R}\nu>-1)$$

**11.4.11**

$$\int_0^{\frac{\pi}{2}} J_\mu(z\sin^2 t)J_\nu(z\cos^2 t)\csc 2t dt$$

$$=\frac{(\mu+\nu)}{4\mu\nu}J_{\mu+\nu}(z) \qquad (\mathscr{R}\mu>0, \mathscr{R}\nu>0)$$

## Infinite Integrals

### Integrals of the Form $\int_0^\infty e^{-pt}t^\mu Z_\nu(t)dt$

**11.4.12**

$$\int_0^\infty e^{it}t^{\mu-1}J_\nu(t)dt=\frac{e^{\frac{1}{2}i\pi(\mu+\nu)}\,\Gamma(\mu+\nu)\,\Gamma(\frac{1}{2}-\mu)}{\Gamma(\frac{1}{2})2^\mu\Gamma(\nu-\mu+1)}$$

$$\left(\mathscr{R}\mu<\frac{1}{2}, \mathscr{R}(\mu+\nu)>0\right)$$

**11.4.13**

$$\int_0^\infty e^{-t}t^{\mu-1}I_\nu(t)dt=\frac{\Gamma(\mu+\nu)\Gamma(\frac{1}{2}-\mu)}{\Gamma(\frac{1}{2})2^\mu\Gamma(\nu-\mu+1)}$$

$$\left(\mathscr{R}\mu<\frac{1}{2}, \mathscr{R}(\mu+\nu)>0\right)$$

**11.4.14**

$$\int_0^\infty \cos bt\,K_0(t)\,dt=\frac{\frac{1}{2}\pi}{(1+b^2)^{\frac{1}{2}}} \qquad (|\mathscr{I}b|<1)$$

**11.4.15**

$$\int_0^\infty \sin bt\,K_0(t)dt=\frac{\text{arc sinh } b}{(1+b^2)^{\frac{1}{2}}} \qquad (|\mathscr{I}b|<1)$$

**11.4.16** $$\int_0^\infty t^\mu J_\nu(t)dt=\frac{2^\mu\Gamma\left(\frac{\nu+\mu+1}{2}\right)}{\Gamma\left(\frac{\nu-\mu+1}{2}\right)}$$

$$\left(\mathscr{R}(\mu+\nu)>-1, \mathscr{R}\mu<\frac{1}{2}\right)$$

**11.4.17** $$\int_0^\infty J_\nu(t)dt=1 \qquad (\mathscr{R}\nu>-1)$$

**11.4.18**

$$\int_0^\infty \frac{[1-J_0(t)]dt}{t^\mu}=\frac{\Gamma\left(\frac{\mu-1}{2}\right)\Gamma\left(\frac{3-\mu}{2}\right)}{2^\mu\left\{\Gamma\left(\frac{\mu+1}{2}\right)\right\}^2} \quad (1<\mathscr{R}\mu<3)$$

**11.4.19**

$$\int_0^\infty t^\mu Y_\nu(t)dt=\frac{2^\mu}{\pi}\Gamma\left(\frac{\mu+\nu+1}{2}\right)\Gamma\left(\frac{\mu-\nu+1}{2}\right)$$

$$\times\sin\frac{\pi}{2}(\mu-\nu)\left(\mathscr{R}(\mu\pm\nu)>-1, \mathscr{R}\mu<\frac{1}{2}\right)$$

**11.4.20** $$\int_0^\infty Y_\nu(t)dt=-\tan\frac{\nu\pi}{2} \qquad (|\mathscr{R}\nu|<1)$$

**11.4.21** $$\int_0^\infty Y_0(t)dt=0$$

**11.4.22**

$$\int_0^\infty t^\mu K_\nu(t)dt=2^{\mu-1}\Gamma\left(\frac{\mu+\nu+1}{2}\right)\Gamma\left(\frac{\mu-\nu+1}{2}\right)$$

$$(\mathscr{R}(\mu\pm\nu)>-1)$$

**11.4.23** $$\int_0^\infty K_0(t)dt=\frac{\pi}{2}$$

**11.4.24** $$\int_{-\infty}^\infty e^{-i\omega t}J_n(t)dt=\frac{2(-i)^nT_n(\omega)}{(1-\omega^2)^{\frac{1}{2}}} \quad (\omega^2<1)$$

$$=0(\omega^2>1)$$

where $T_n(\omega)$ is the Chebyshev polynomial of the first kind (see chapter **22**).

**11.4.25**

$$\int_{-\infty}^\infty t^{-1}e^{-i\omega t}J_n(t)dt$$

$$=\frac{2i}{n}(-i)^n(1-\omega^2)^{\frac{1}{2}}U_{n-1}(\omega)(\omega^2<1)$$

$$=0(\omega^2>1)$$

where $U_n(\omega)$ is the Chebyshev polynomial of the second kind (see chapter **22**).

**11.4.26**

$$\int_{-\infty}^\infty t^{-\frac{1}{2}}e^{-i\omega t}J_{n+\frac{1}{2}}(t)dt=(-i)^n(2\pi)^{\frac{1}{2}}P_n(\omega)(\omega^2<1)$$

$$=0(\omega^2>1)$$

where $P_n(\omega)$ is the Legendre polynomial (see chapter **22**).

**11.4.27**

$$\int_0^\infty e^{-t}t^{\frac{a}{2}-1}J_a[2(zt)^{\frac{1}{2}}]dt=\frac{\gamma(a, z)}{z^{a/2}} \quad (\mathscr{R}a>0, \mathscr{R}z>0)$$

where $\gamma(a, z)$ is the incomplete gamma function (see chapter **6**).

### Integrals of the Form $\int_0^\infty e^{-a^2t^2}t^\mu Z_\nu(bt)\,dt$

**11.4.28**

$$\int_0^\infty e^{-a^2t^2}t^{\mu-1}J_\nu(bt)dt$$

$$=\frac{\Gamma\left(\frac{1}{2}\nu+\frac{1}{2}\mu\right)\left(\frac{1}{2}\frac{b}{a}\right)^\nu}{2a^\mu\Gamma(\nu+1)}M\left(\frac{1}{2}\nu+\frac{1}{2}\mu, \nu+1, -\frac{b^2}{4a^2}\right)$$

$$(\mathscr{R}(\mu+\nu)>0, \mathscr{R}a^2>0)$$

where the notation $M(a, b, z)$ stands for the confluent hypergeometric function (see chapter **13**).

**11.4.29**

$$\int_0^\infty e^{-a^2t^2}t^{\nu+1}J_\nu(bt)dt$$

$$=\frac{b^\nu}{(2a^2)^{\nu+1}}e^{-\frac{b^2}{4a^2}} \qquad (\mathscr{R}\nu>-1, \mathscr{R}a^2>0)$$

**11.4.30**

$$\int_0^\infty e^{-a^2t^2}Y_{2\nu}(bt)dt=-\frac{\pi^{\frac{1}{2}}}{2a}\,e^{-\frac{b^2}{8a^2}}\left[I_\nu\left(\frac{b^2}{8a^2}\right)\tan\nu\pi\right.$$

$$\left.+\frac{1}{\pi}K_\nu\left(\frac{b^2}{8a^2}\right)\sec\nu\pi\right]\qquad\left(|\mathscr{R}\nu|<\frac{1}{2},\mathscr{R}a^2>0\right)$$

**11.4.31**

$$\int_0^\infty e^{-a^2t^2}I_\nu(bt)dt=\frac{\pi^{\frac{1}{2}}}{2a}\,e^{\frac{b^2}{8a^2}}\,I_{\frac{1}{2}\nu}\left(\frac{b^2}{8a^2}\right)$$

$$(\mathscr{R}\nu>-1,\mathscr{R}a^2>0)$$

**11.4.32**

$$\int_0^\infty e^{-a^2t^2}K_0(bt)dt=\frac{\pi^{\frac{1}{2}}}{4a}\,e^{\frac{b^2}{8a^2}}\,K_0\left(\frac{b^2}{8a^2}\right)\qquad(\mathscr{R}a^2>0)$$

### Weber-Schafheitlin Type Integrals

**11.4.33**

$$\int_0^\infty\frac{J_\mu(at)J_\nu(bt)dt}{t^\lambda}=\frac{b^\nu\Gamma\left(\frac{\mu+\nu-\lambda+1}{2}\right)}{2^\lambda a^{\nu-\lambda+1}\Gamma(\nu+1)\Gamma\left(\frac{\mu-\nu+\lambda+1}{2}\right)}$$

$$\times{}_2F_1\left(\frac{\mu+\nu-\lambda+1}{2},\frac{\nu-\mu-\lambda+1}{2};\nu+1;\frac{b^2}{a^2}\right)$$

$$(\mathscr{R}(\mu+\nu-\lambda+1)>0,\mathscr{R}\lambda>-1,0<b<a)$$

**11.4.34**

$$\int_0^\infty\frac{J_\mu(at)J_\nu(bt)dt}{t^\lambda}=\frac{a^\mu\Gamma\left(\frac{\mu+\nu-\lambda+1}{2}\right)}{2^\lambda b^{\mu-\lambda+1}\Gamma(\mu+1)\Gamma\left(\frac{\nu-\mu+\lambda+1}{2}\right)}$$

$$\times{}_2F_1\left(\frac{\mu+\nu-\lambda+1}{2},\frac{\mu-\nu-\lambda+1}{2};\mu+1;\frac{a^2}{b^2}\right)$$

$$(\mathscr{R}(\mu+\nu-\lambda+1)>0,\mathscr{R}\lambda>-1,0<a<b)$$

For ${}_2F_1$, see chapter **15.**

### Special Cases of the Discontinuous Weber-Schafheitlin Integral

**11.4.35**

$$\int_0^\infty\frac{J_\mu(at)\sin bt\,dt}{t}=\frac{1}{\mu}\sin\left[\mu\arcsin\frac{b}{a}\right]\qquad(0\leq b\leq a)$$

$$=\frac{a^\mu\sin\frac{\pi\mu}{2}}{\mu[b+(b^2-a^2)^{\frac{1}{2}}]^\mu}\qquad(b\geq a>0)$$

$$(\mathscr{R}\mu>-1)$$

**11.4.36**

$$\int_0^\infty\frac{J_\mu(at)\cos bt\,dt}{t}=\frac{1}{\mu}\cos\left[\mu\arcsin\frac{b}{a}\right]\qquad(0\leq b\leq a)$$

$$=\frac{a^\mu\cos\frac{\pi\mu}{2}}{\mu[b+(b^2-a^2)^{\frac{1}{2}}]^\mu}\qquad(b\geq a>0)$$

$$(\mathscr{R}\mu>0)$$

**11.4.37**

$$\int_0^\infty J_\mu(at)\cos bt\,dt=\frac{\cos\left[\mu\arcsin\frac{b}{a}\right]}{(a^2-b^2)^{\frac{1}{2}}}\qquad(0\leq b<a)$$

$$=\frac{-a^\mu\sin\frac{\pi\mu}{2}}{(b^2-a^2)^{\frac{1}{2}}[b+(b^2-a^2)^{\frac{1}{2}}]^\mu}$$

$$(b>a>0)\qquad(\mathscr{R}\mu>-1)$$

**11.4.38**

$$\int_0^\infty J_\mu(at)\sin bt\,dt=\frac{\sin\left[\mu\arcsin\frac{b}{a}\right]}{(a^2-b^2)^{\frac{1}{2}}}\qquad(0\leq b<a)$$

$$=\frac{a^\mu\cos\frac{\pi\mu}{2}}{(b^2-a^2)^{\frac{1}{2}}[b+(b^2-a^2)^{\frac{1}{2}}]^\mu}$$

$$(b>a>0)\qquad(\mathscr{R}\mu>-2)$$

**11.4.39** $$\int_0^\infty e^{ibt}J_0(at)dt=\frac{1}{(a^2-b^2)^{\frac{1}{2}}}\qquad(0\leq b<a)$$

$$=\frac{i}{(b^2-a^2)^{\frac{1}{2}}}\qquad(0<a<b)$$

**11.4.40**

$$\int_0^\infty e^{ibt}Y_0(at)dt=\frac{2i}{\pi(a^2-b^2)^{\frac{1}{2}}}\arcsin\frac{b}{a}\qquad(0\leq b<a)$$

$$=\frac{-1}{(b^2-a^2)^{\frac{1}{2}}}+\frac{2i}{\pi(b^2-a^2)^{\frac{1}{2}}}$$

$$\times\ln\left\{\frac{b-(b^2-a^2)^{\frac{1}{2}}}{a}\right\}\qquad(0<a<b)$$

**11.4.41**

$$\int_0^\infty t^{\mu-\nu+1}J_\mu(at)J_\nu(bt)dt=0\qquad(0<b<a)$$

$$=\frac{2^{\mu-\nu+1}a^\mu(b^2-a^2)^{\nu-\mu-1}}{b^\nu\Gamma(\nu-\mu)}$$

$$(b>a>0)$$

$$(\mathscr{R}\nu>\mathscr{R}\mu>-1)$$

**11.4.42** $$\int_0^\infty J_\mu(at)J_{\mu-1}(bt)dt=\frac{b^{\mu-1}}{a^\mu}\qquad(0<b<a)$$

$$=\frac{1}{2b}\qquad(0<b=a)$$

$$=0\qquad(b>a>0)$$

$$(\mathscr{R}\mu>0)$$

**11.4.43** $$\int_0^\infty\frac{J_0(at)}{t}\{1-J_0(bt)\}dt=0\qquad(0<b\leq a)$$

$$=\ln\frac{b}{a}\ (b\geq a>0)$$

### Hankel-Nicholson Type Integrals

**11.4.44**

$$\int_0^\infty \frac{t^{\nu+1}J_\nu(at)dt}{(t^2+z^2)^{\mu+1}}=\frac{a^\mu z^{\nu-\mu}}{2^\mu\Gamma(\mu+1)}K_{\nu-\mu}(az)$$

$$\left(a>0,\ \mathscr{R}z>0, -1<\mathscr{R}\nu<2\mathscr{R}\mu+\frac{3}{2}\right)$$

**11.4.45**

$$\int_0^\infty \frac{J_\nu(at)dt}{t^\nu(t^2+z^2)}=\frac{\pi}{2z^{\nu+1}}[I_\nu(az)-\mathbf{L}_\nu(az)]$$

$$\left(a>0, \mathscr{R}z>0, \mathscr{R}\nu>-\frac{5}{2}\right)$$

**11.4.46**

$$\int_0^\infty \frac{Y_0(at)dt}{t^2+z^2}=-\frac{K_0(az)}{z} \qquad (a>0, \mathscr{R}z>0)$$

**11.4.47**

$$\int_0^\infty \frac{K_\nu(at)dt}{t^\nu(t^2+z^2)}=\frac{\pi^2}{4z^{\nu+1}\cos\nu\pi}[\mathbf{H}_\nu(az)-Y_\nu(az)]$$

$$(\mathscr{R}a>0,\ \ \mathscr{R}z>0, \mathscr{R}\nu<\tfrac{1}{2})$$

**11.4.48**

$$\int_0^\infty \frac{J_\nu(at)dt}{(t^2+z^2)^{\frac{1}{2}}}=I_{\frac{1}{2}\nu}(\tfrac{1}{2}az)K_{\frac{1}{2}\nu}(\tfrac{1}{2}az)$$

$$(a>0, \mathscr{R}z>0, \mathscr{R}\nu>-1)$$

**11.4.49**

$$\int_0^\infty \frac{J_\nu(at)dt}{t^\nu(t^2+z^2)^{\nu+\frac{1}{2}}}=\frac{\left(\frac{2a}{z^2}\right)^\nu\Gamma(\nu+1)}{\Gamma(2\nu+1)}I_\nu(\tfrac{1}{2}az)K_\nu(\tfrac{1}{2}az)$$

$$(a>0, \mathscr{R}z>0, \mathscr{R}\nu>-\tfrac{1}{2})$$

## Numerical Methods

### 11.5. Use and Extension of the Tables

$$\int_0^x J_0(t)dt, \int_0^x Y_0(t)dt, \int_0^x I_0(t)dt, \int_x^\infty K_0(t)dt$$

For moderate values of $x$, use **11.1.2** and **11.1.7–11.1.10** as appropriate. For $x$ sufficiently large, use the asymptotic expansions or the polynomial approximations **11.1.11–11.1.18.**

**Example 1.** Compute $\int_0^{3.05} J_0(t)dt$ to 5D. Using **11.1.2** and interpolating in **Tables 9.1** and **9.2,** we have

$$\int_0^{3.05} J_0(t)dt=2[.32019\,09+.31783\,69+.04611\,52$$
$$+.00283\,19+.00009\,72+.00000\,21]$$
$$=1.37415$$

**Example 2.** Compute $\int_0^{3.05} J_0(t)dt$ to 5D by interpolation of **Table 11.1** using Taylor's formula. We have

$$\int_0^{x+h} J_0(t)dt=\int_0^x J_0(t)dt+hJ_0(x)-\frac{h^2}{2}J_1(x)$$
$$+\frac{h^3}{12}[J_2(x)-J_0(x)]+\frac{h^4}{96}[3J_1(x)-J_3(x)]+\dots$$

Then with $x=3.0$ and $h=.05$,

$$\int_0^{3.05} J_0(t)dt=1.387567+(.05)(-.260052)$$
$$-(.00125)(.339059)$$
$$+(.000010)(.746143)=1.37415$$

This value is readily checked using $x=3.1$ and $h=-.05$. Now $|J_0(x)|\leq 1$ for all $x$ and $|J_n(x)|<2^{-\frac{1}{2}}, n\geq 1$ for all $x$. In **Table 11.1,** we can always choose $|h|\leq .05$. Thus if all terms of $O(h^4)$ and higher are neglected, then a bound for the absolute error is $2^{\frac{1}{2}}h^4/48<.2\cdot 10^{-6}$ for all $x$ if $|h|\leq .05$. Similarly, the absolute error for quadratic interpolation does not exceed

$$h^3(2^{\frac{1}{2}}+2)/24<.2\cdot 10^{-4}.$$

**Example 3.** Interpolation of $\int_0^x J_0(t)dt$ using Simpson's rule. We have

$$\int_0^{x+h} J_0(t)dt=\int_0^x J_0(t)dt+\int_x^{x+h} J_0(t)dt$$

$$\int_x^{x+h} J_0(t)dt=\frac{h}{6}\left[J_0(x)+4J_0\left(x+\frac{h}{2}\right)+J_0(x+h)\right]+R$$

$$R=-\frac{h^5}{2880}J_0^{(4)}(\xi), \qquad x<\xi<x+h$$

Now

$$J_0^{(4)}(x)=\frac{1}{8}[J_4(x)-4J_2(x)+3J_0(x)]$$

$$|J_0^{(4)}(x)|<\frac{6+5\sqrt{2}}{16}<.82$$

and with $|h|\leq .05$, it follows that

$$|R|<.9\cdot 10^{-10}$$

Thus if $x=3.0$ and $h=.05$

$$\int_0^{3.05} J_0(t)dt=1.38756\,72520+\frac{(.05)}{6}[-.26005\,19549$$
$$+4(-.26841\,13883)-.27653\,49599]$$
$$=1.37414\,86481$$

which is correct to 10D. The above procedure gives high accuracy though it may be necessary to interpolate twice in $J_0(x)$ to compute $J_0\left(x+\frac{h}{2}\right)$ and $J_0(x+h)$. A similar technique based on the trapezoidal rule is less accurate, but at most only one interpolation of $J_0(x)$ is required.

**Example 4.** Compute $\int_0^3 J_0(t)dt$ and $\int_0^3 Y_0(t)dt$ to 5D using the representation in terms of Struve functions and the tables in chapters **9** and **12.**

For $x=3$, from **Tables 9.1** and **12.1**

$$J_0=-.260052 \qquad J_1=.339059$$
$$Y_0=.376850 \qquad Y_1=.324674$$
$$\mathbf{H}_0=.574306 \qquad \mathbf{H}_1=1.020110$$

Using **11.1.7**, we have

$$\int_0^3 J_0(t)dt=3(-.260052)+\frac{3\pi}{2}[(.574306)(.339059)-(1.020110)(-.260052)]$$
$$=1.38757$$

Similarly,

$$\int_0^3 Y_0(t)dt=.19766$$

Using **11.1.8** and **Tables 9.8** and **12.1,** one can compute $\int_0^x I_0(t)dt$ and $\int_0^x K_0(t)dt$.

$$\int_x^\infty \frac{J_0(t)dt}{t}, \int_x^\infty \frac{Y_0(t)dt}{t}, \int_0^x \frac{[I_0(t)-1]dt}{t}, \int_x^\infty \frac{K_0(t)dt}{t}$$

For moderate values of $x$, use **11.1.19–11.1.23.** For $x$ sufficiently large, use the asymptotic expansions or the polynomial approximations **11.1.24–11.1.31.**

### Repeated Integrals of $J_0(x)$

For moderate values of $x$ and $r$, use **11.2.4.** If $r=1$, see **Example 1.** For moderate values of $x$, use the recurrence formula **11.2.5.** If $x$ is large and $x\gg r$, see the discussion below.

**Example 5.** Compute $f_{r,0}(x)=f_r(x)$ to 5D for $x=2$ and $r=0(1)5$ using **11.2.6.** We have

$$rf_{r+1}(x)=xf_r(x)-(r-1)f_{r-1}(x)+xf_{r-2}(x)$$

$$f_{-1}(x)=-J_1(x), f_0(x)=J_0(x), f_1(x)=\int_0^x J_0(t)\,dt$$

and the terms on this last line are tabulated. Thus for $x=2$,

$$f_{-1}=-.57672\ 48, f_0=.22389\ 08, f_1=1.42577\ 03$$

The recurrence formula gives

$$f_2=2(f_1+f_{-1})=1.69809\ 10$$

Similarly,

$$f_3=1.20909\ 66, f_4=.62451\ 73, f_5=.25448\ 17$$

When $x>>r$, it is convenient to use the auxiliary function

$$g_r(x)=(r-1)!x^{-r+1}f_r(x)$$

This satisfies the recurrence relation

$$x^2g_{r+1}(x)=x^2g_r-(r-1)^2g_{r-1}(x)$$
$$+(r-1)(r-2)g_{r-2}(x),\ r\geq 3$$

$$g_1(x)=\int_0^x J_0(t)dt,\ g_2(x)=g_1(x)-J_1(x)$$
$$g_3(x)=[x^2g_2(x)-g_1(x)+xJ_0(x)]/x^2$$

**Example 6.** Compute $g_r(x)$ to 5D for $x=10$ and $r=0(1)6$. We have for $x=10$,

$$J_0=-.24593\ 58, J_1=.04347\ 27, g_1=1.06701\ 13$$

Thus

$$g_2=1.02353\ 86, g_3=.98827\ 49$$

and the forward recurrence formula gives

$$g_4=.96867\ 36, g_5=.94114\ 12, g_6=.90474\ 64$$

For tables of $2^{-r}f_r(x)$, see [11.16].

### Repeated Integrals of $K_0(x)$

For moderate values of $x$, use the recurrence formula **11.2.14** for all $r$.

**Example 7.** Compute $\mathrm{Ki}_r(x)$ to 5D for $x=2$ and $r=0(1)5$. We have

$$r\mathrm{Ki}_{r+1}(x)=-x\mathrm{Ki}_r(x)+(r-1)\mathrm{Ki}_{r-1}(x)+x\mathrm{Ki}_{r-2}(x)$$

$$\mathrm{Ki}_{-1}(x)=K_1(x),\ \mathrm{Ki}_0(x)=K_0(x),\ \mathrm{Ki}_1(x)=\int_x^\infty K_0(t)dt$$

and the functions on this last line are tabulated Thus for $x=2$,

$$K_0=.11389\ 39, K_1=.13986\ 59, \mathrm{Ki}_1=.09712\ 06$$

and

$$\mathrm{Ki}_2=-2\mathrm{Ki}_1+2K_1=.08549\ 06$$

Similarly,

$$\mathrm{Ki}_3=.07696\ 36, \mathrm{Ki}_4=.07043\ 17, \mathrm{Ki}_5=.06525\ 22$$

If $x/r$ is not large the formula can still be used provided that the starting values are sufficiently accurate to offset the growth of rounding error.

For tables of $\mathrm{Ki}_r(x)$, see [11.11].

$$\underline{f_m(x)=x^{-m}\int_0^x t^m K_0(t)dt}$$

Now

$$f_0(x)=\int_0^x K_0(t)dt, f_1(x)=[1-xK_1(x)]/x$$

the latter following from **11.3.27** with $\nu=1$. In **11.3.5**, put $a=1$, $b=-1$, $p=0$ and $\nu=0$. Let $\mu=m$. Then

$$f_m(x)=[(m-1)^2 f_{m-2}(x)-x^2K_1(x) -x(m-1)K_0(x)]/x^2 \qquad (m>1)$$

Using tabular values of $f_0$ and $f_1$, one can compute in succession $f_2, f_3, \ldots$ provided that $m/x$ is not large.

**Example 8.** Compute $f_m(x)$ to 5D for $x=5$ and $m=0(1)6$. We have, retaining two additional decimals

$$K_0= .00369\ 11 \qquad K_1=.00404\ 46$$

$$f_0=1.56738\ 74 \qquad f_1=.19595\ 54$$

Thus

$$f_2=.05791\ 27, f_4=.01458\ 93, f_6=.00685\ 36$$

Similarly starting with $f_1$, we can compute $f_3$ and $f_5$.

If $m>x$, employ the recurrence formula in backward form and write

$$f_{m-2}(x)=[x^2f_m(x)+x^2K_1(x)+x(m-1)K_0(x)]/(m-1)^2$$

In the latter expression, replace $f_m$ by $g_m$. Fix $x$. Take $r>m$ and assume $g_r=0$. Compute $g_{r-2}$, $g_{r-4}$, etc. Then

$$\lim_{r\to\infty} g_{r-2k}(x)=f_m(x), \ m=r-2k$$

Apart from round-off error, the value of $r$ needed to achieve a stated accuracy for given $x$ and $m$ can be determined a priori. Let

$$\epsilon_r=|g_r-f_r|$$

Then

$$\epsilon_{r-2k}=\frac{x^{2k}\epsilon_r}{(r-1)^2(r-3)^2\ldots(r-2k+1)^2}$$

$$\epsilon_r\leq[x^2K_1(x)+x(r-1)K_0(x)]/(r-1)^2$$

since for $x$ fixed, $f_r(x)$ is positive and decreases as $r$ increases.

**Example 9.** Compute $f_m(x)$ to 5D for $x=3$ and $m=0(2)10$. We have

$$K_0=.03473\ 95 \qquad K_1=.04015\ 64$$

If $r=16$,

$$\epsilon_{16}<.86\cdot10^{-2} \qquad \epsilon_{10}<1.4\cdot10^{-6}$$

Taking $g_{16}=0$, we compute the following values of $g_{14}, g_{12}, \ldots, g_0$ by recurrence. Also recorded are the required values of $f_m$ to 5D.

| $m$ | $g_m$ | $f_m$ |
|---|---|---|
| 14 | .00855 42 | |
| 12 | .01061 09 | |
| 10 | .01325 05 | .01325 |
| 8 | .01751 39 | .01751 |
| 6 | .02548 09 | .02548 |
| 4 | .04447 31 | .04447 |
| 2 | .11936 90 | .11937 |
| 0 | 1.53994 71 | 1.53995 |

For tables of $f_m(x)$, see [11.21].

# 12. Struve Functions and Related Functions

## Mathematical Properties

### 12.1. Struve Function $\mathbf{H}_\nu(z)$

#### Differential Equation and General Solution

**12.1.1**

$$z^2\frac{d^2w}{dz^2}+z\frac{dw}{dz}+(z^2-\nu^2)w=\frac{4(\frac{1}{2}z)^{\nu+1}}{\sqrt{\pi}\,\Gamma(\nu+\frac{1}{2})}$$

The general solution is

**12.1.2** $w=aJ_\nu(z)+bY_\nu(z)+\mathbf{H}_\nu(z)$ ($a,b$, constants)

where $z^{-\nu}\mathbf{H}_\nu(z)$ is an entire function of $z$.

#### Power Series Expansion

**12.1.3**

$$\mathbf{H}_\nu(z)=(\tfrac{1}{2}z)^{\nu+1}\sum_{k=0}^{\infty}\frac{(-1)^k(\frac{1}{2}z)^{2k}}{\Gamma(k+\frac{3}{2})\Gamma(k+\nu+\frac{3}{2})}$$

**12.1.4** $$\mathbf{H}_0(z)=\frac{2}{\pi}\left[z-\frac{z^3}{1^2\cdot 3^2}+\frac{z^5}{1^2\cdot 3^2\cdot 5^2}-\cdots\right]$$

**12.1.5**

$$\mathbf{H}_1(z)=\frac{2}{\pi}\left[\frac{z^2}{1^2\cdot 3}-\frac{z^4}{1^2\cdot 3^2\cdot 5}+\frac{z^6}{1^2\cdot 3^2\cdot 5^2\cdot 7}-\cdots\right]$$

#### Integral Representations

If $\mathscr{R}\nu>-\frac{1}{2}$,

**12.1.6**

$$\mathbf{H}_\nu(z)=\frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\,\Gamma(\nu+\frac{1}{2})}\int_0^1(1-t^2)^{\nu-\frac{1}{2}}\sin(zt)\,dt$$

**12.1.7** $$=\frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\,\Gamma(\nu+\frac{1}{2})}\int_0^{\frac{\pi}{2}}\sin(z\cos\theta)\sin^{2\nu}\theta\,d\theta$$

**12.1.8** $$=Y_\nu(z)$$

$$+\frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\,\Gamma(\nu+\frac{1}{2})}\int_0^\infty e^{-zt}(1+t^2)^{\nu-\frac{1}{2}}dt$$

$$\left(|\arg z|<\frac{\pi}{2}\right)$$

#### Recurrence Relations

**12.1.9** $$\mathbf{H}_{\nu-1}+\mathbf{H}_{\nu+1}=\frac{2\nu}{z}\mathbf{H}_\nu+\frac{(\frac{1}{2}z)^\nu}{\sqrt{\pi}\,\Gamma(\nu+\frac{3}{2})}$$

**12.1.10** $$\mathbf{H}_{\nu-1}-\mathbf{H}_{\nu+1}=2\mathbf{H}'_\nu-\frac{(\frac{1}{2}z)^\nu}{\sqrt{\pi}\,\Gamma(\nu+\frac{3}{2})}$$

**12.1.11** $$\mathbf{H}'_0=(2/\pi)-\mathbf{H}_1$$

**12.1.12** $$\frac{d}{dz}(z^\nu\mathbf{H}_\nu)=z^\nu\mathbf{H}_{\nu-1}$$

**12.1.13** $$\frac{d}{dz}(z^{-\nu}\mathbf{H}_\nu)=\frac{1}{\sqrt{\pi}\,2^\nu\Gamma(\nu+\frac{3}{2})}-z^{-\nu}\mathbf{H}_{\nu+1}$$

$\mathbf{H}_n(x)$, $-n=1(1)3$

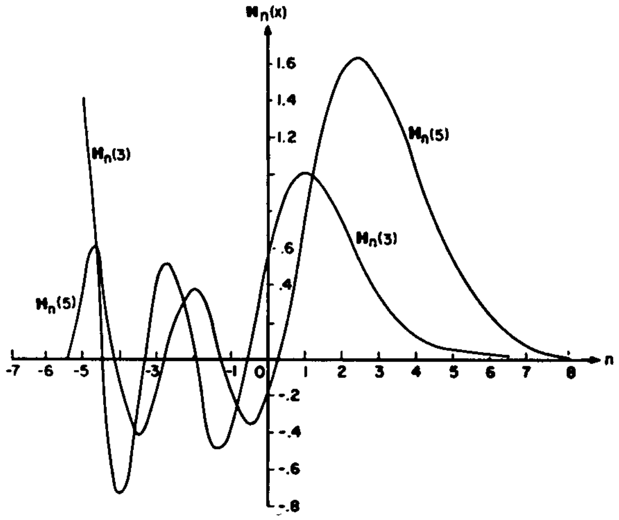

FIGURE 12.3. *Struve functions.*

$\mathbf{H}_n(x)$, $x=3, 5$

### Special Properties

**12.1.14** $\mathbf{H}_\nu(x)\geq 0 \qquad (x>0 \text{ and } \nu\geq\tfrac12)$

**12.1.15**

$$\mathbf{H}_{-(n+\frac12)}(z)=(-1)^n J_{n+\frac12}(z) \quad (n \text{ an integer}\geq 0)$$

**12.1.16** $$\mathbf{H}_{\frac12}(z)=\left(\frac{2}{\pi z}\right)^{\frac12}(1-\cos z)$$

**12.1.17**

$$\mathbf{H}_{\frac32}(z)=\left(\frac{z}{2\pi}\right)^{\frac12}\left(1+\frac{2}{z^2}\right)-\left(\frac{2}{\pi z}\right)^{\frac12}\left(\sin z+\frac{\cos z}{z}\right)$$

**12.1.18** $\mathbf{H}_\nu(ze^{m\pi i})=e^{m(\nu+1)\pi i}\,\mathbf{H}_\nu(z)$ ($m$ an integer)

**12.1.19** $$\mathbf{H}_0(z)=\frac{4}{\pi}\sum_{k=0}^{\infty}\frac{J_{2k+1}(z)}{2k+1}$$

**12.1.20** $$\mathbf{H}_1(z)=\frac{2}{\pi}-\frac{2}{\pi}J_0(z)+\frac{4}{\pi}\sum_{k=1}^{\infty}\frac{J_{2k}(z)}{4k^2-1}$$

**12.1.21** $$\mathbf{H}_\nu(z)=\frac{2(z/2)^{\nu+1}}{\sqrt{\pi}\,\Gamma(\nu+\frac32)}\,{}_1F_2\left(1;\frac32+\nu,\frac32;-\frac{z^2}{4}\right)$$

### Integrals (See chapter 11)

**12.1.22** $$\int_0^\infty t^{-1}\,\mathbf{H}_0(t)dt=\frac{\pi}{2}$$

**12.1.23**

$$\int_0^z \mathbf{H}_0(t)dt=\frac{2}{\pi}\left[\frac{z^2}{2}-\frac{z^4}{1^2.3^2.4}+\frac{z^6}{1^2.3^2.5^2.6}-\cdots\right]$$

**12.1.24** $$\int_0^z t^{-\nu}\,\mathbf{H}_{\nu+1}(t)dt=\frac{z}{2^\nu\sqrt{\pi}\,\Gamma(\nu+\frac32)}-z^{-\nu}\,\mathbf{H}_\nu(z)$$

### Struve's Integral

**12.1.25**

$$\frac{4}{\pi}\int_z^\infty t^{-2}\,\mathbf{H}_1(t)dt=\frac{2}{\pi z}\mathbf{H}_1(z)+\frac{2}{\pi}\int_z^\infty t^{-1}\,\mathbf{H}_0(t)dt$$

**12.1.26**

$$\frac{2}{\pi}\int_z^\infty t^{-1}\,\mathbf{H}_0(t)dt=1-\frac{4}{\pi^2}\left[z-\frac{z^3}{1^2.3^2.3}+\frac{z^5}{1^2.3^2.5^2.5}-\cdots\right]$$

**12.1.27**

$$\int_0^\infty t^{\mu-\nu-1}\mathbf{H}_\nu(t)dt=\frac{\Gamma(\frac12\mu)2^{\mu-\nu-1}\tan(\frac12\pi\mu)}{\Gamma(\nu-\frac12\mu+1)}$$

$$(|\mathscr{R}\mu|<1, \mathscr{R}\nu>\mathscr{R}\mu-\tfrac32)$$

If $f_\nu(z)=\int_0^z \mathbf{H}_\nu(t)t^\nu dt$

**12.1.28**

$$f_{\nu+1}=(2\nu+1)f_\nu(z)-z^{\nu+1}\mathbf{H}_\nu(z)+\frac{z^{2\nu+2}}{(\nu+1)2^{\nu+1}\Gamma(\frac12)\Gamma(\nu+\frac32)} \quad (\mathscr{R}\nu>-\tfrac12)$$

### Asymptotic Expansions for Large $|z|$

**12.1.29**

$$\mathbf{H}_\nu(z)-Y_\nu(z)=\frac{1}{\pi}\sum_{k=0}^{m-1}\frac{\Gamma(k+\frac12)}{\Gamma(\nu+\frac12-k)\left(\frac{z}{2}\right)^{2k-\nu+1}}+R_m$$

$$(|\arg z|<\pi)$$

where $R_m=O(|z|^{\nu-2m-1})$. If $\nu$ is real, $z$ positive* and $m+\frac12-\nu\geq 0$, the remainder after $m$ terms is of the same sign and numerically less than the first term neglected.

**12.1.30**

$$\mathbf{H}_0(z)-Y_0(z)\sim\frac{2}{\pi}\left[\frac{1}{z}-\frac{1}{z^3}+\frac{1^2\cdot3^2}{z^5}-\frac{1^2\cdot3^2\cdot5^2}{z^7}+\ldots\right]$$

$$(|\arg z|<\pi)$$

**12.1.31**

$$\mathbf{H}_1(z)-Y_1(z)\sim\frac{2}{\pi}\left[1+\frac{1}{z^2}-\frac{1^2\cdot3}{z^4}+\frac{1^2\cdot3^2\cdot5}{z^6}-\ldots\right]$$

$$(|\arg z|<\pi)$$

**12.1.32**

$$\int_0^z[\mathbf{H}_0(t)-Y_0(t)]dt-\frac{2}{\pi}[\ln(2z)+\gamma]\sim\frac{2}{\pi}\sum_{k=1}^{\infty}\frac{(-1)^{k+1}(2k)!(2k-1)!}{(k!)^2(2z)^{2k}} \quad (|\arg z|<\pi)$$

where $\gamma=.57721\ 56649\ldots$ is Euler's constant.

**12.1.33**

$$\int_z^\infty t^{-1}[\mathbf{H}_0(t)-Y_0(t)]dt\sim\frac{2}{\pi z}\sum_{k=0}^{\infty}\frac{(-1)^k[(2k)!]^2}{(k!)^2(2k+1)(2z)^{2k}}$$

$$(|\arg z|<\pi)$$

---

*See page II.

### Asymptotic Expansions for Large Orders

**12.1.34**

$$\mathbf{H}_\nu(z)-Y_\nu(z)\sim\frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu+\frac{1}{2})}\sum_{k=0}^{\infty}\frac{k!b_k}{z^{k+1}}$$

$$(|\arg z|<\tfrac{1}{2}\pi, |\nu|<|z|)$$

$b_0=1,\ b_1=2\nu/z,\ b_2=6(\nu/z)^2-\frac{1}{2},\ b_3=20(\nu/z)^3-4(\nu/z)$

**12.1.35**

$$\mathbf{H}_\nu(z)+iJ_\nu(z)\sim\frac{2(\frac{1}{2}z)^\nu}{\sqrt{\pi}\Gamma(\nu+\frac{1}{2})}\sum_{k=0}^{\infty}\frac{k!b_k}{z^{k+1}}\qquad(|\nu|>|z|)$$

## 12.2. Modified Struve Function $\mathbf{L}_\nu(z)$

### Power Series Expansion

**12.2.1** $$\mathbf{L}_\nu(z)=-ie^{-\frac{i\nu\pi}{2}}\mathbf{H}_\nu(iz)$$

$$=(\tfrac{1}{2}z)^{\nu+1}\sum_{k=0}^{\infty}\frac{(z/2)^{2k}}{\Gamma(k+\frac{3}{2})\Gamma(k+\nu+\frac{3}{2})}$$

### Integral Representations

**12.2.2** $$\mathbf{L}_\nu(z)=\frac{2(z/2)^\nu}{\sqrt{\pi}\Gamma(\nu+\frac{1}{2})}\int_0^{\frac{\pi}{2}}\sinh(z\cos\theta)\sin^{2\nu}\theta d\theta$$

$$(\mathscr{R}\nu>-\tfrac{1}{2})$$

**12.2.3**

$$I_{-\nu}(x)-\mathbf{L}_\nu(x)=\frac{2(x/2)^\nu}{\sqrt{\pi}\Gamma(\nu+\frac{1}{2})}\int_0^\infty\sin(tx)(1+t^2)^{\nu-\frac{1}{2}}dt$$

$$(\mathscr{R}\nu<\tfrac{1}{2}, x>0)$$

### Recurrence Relations

**12.2.4** $$\mathbf{L}_{\nu-1}-\mathbf{L}_{\nu+1}=\frac{2\nu}{z}\mathbf{L}_\nu+\frac{(z/2)^\nu}{\sqrt{\pi}\Gamma(\nu+\frac{3}{2})}$$

**12.2.5** $$\mathbf{L}_{\nu-1}+\mathbf{L}_{\nu+1}=2\mathbf{L}'_\nu-\frac{(z/2)^\nu}{\sqrt{\pi}\Gamma(\nu+\frac{3}{2})}$$

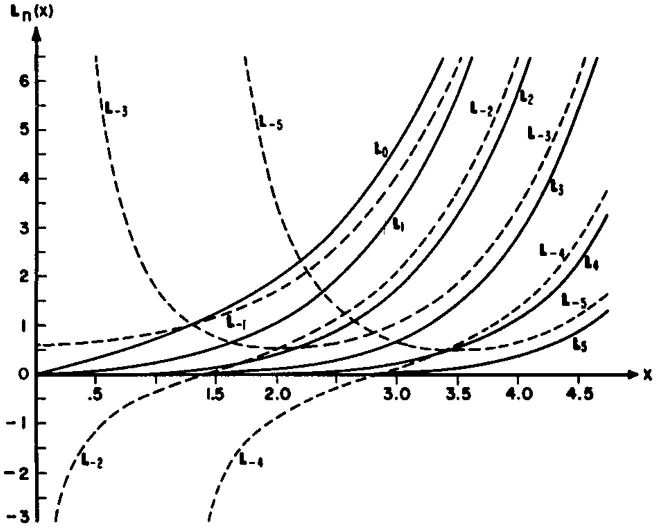

FIGURE 12.4. *Modified Struve functions.*

$\mathbf{L}_n(x),\ \pm n=0(1)5$

### Asymptotic Expansion for Large $|z|$

**12.2.6** $$\mathbf{L}_\nu(z)-I_{-\nu}(z)$$

$$\sim\frac{1}{\pi}\sum_{k=0}^{\infty}\frac{(-1)^{k+1}\Gamma(k+\frac{1}{2})}{\Gamma(\nu+\frac{1}{2}-k)\left(\frac{z}{2}\right)^{2k-\nu+1}}\ (|\arg z|<\tfrac{1}{2}\pi)$$

### Integrals

**12.2.7**

$$\int_0^z\mathbf{L}_0(t)dt=\frac{2}{\pi}\left[\frac{z^2}{2}+\frac{z^4}{1^2\cdot3^2\cdot4}+\frac{z^6}{1^2\cdot3^2\cdot5^2\cdot6}+\cdots\right]$$

**12.2.8** $$\int_0^z[I_0(t)-\mathbf{L}_0(t)]dt-\frac{2}{\pi}[\ln(2z)+\gamma]$$

$$\sim-\frac{2}{\pi}\sum_{k=1}^{\infty}\frac{(2k)!\,(2k-1)!}{(k!)^2(2z)^{2k}}\ (|\arg z|<\tfrac{1}{2}\pi)$$

**12.2.9** $$\int_0^z\mathbf{L}_1(t)dt=\mathbf{L}_0(z)-\frac{2}{\pi}z$$

### Relation to Modified Spherical Bessel Function

**12.2.10** $$\mathbf{L}_{-(n+\frac{1}{2})}(z)=I_{(n+\frac{1}{2})}(z)\quad(n\text{ an integer}\geq0)$$

## 12.3. Anger and Weber Functions

### Anger's Function

**12.3.1** $$\mathbf{J}_\nu(z)=\frac{1}{\pi}\int_0^\pi\cos(\nu\theta-z\sin\theta)\,d\theta$$

**12.3.2** $$\mathbf{J}_n(z)=J_n(z)\qquad(n\text{ an integer})$$

### Weber's Function

**12.3.3** $$\mathbf{E}_\nu(z)=\frac{1}{\pi}\int_0^\pi\sin(\nu\theta-z\sin\theta)\,d\theta$$

### Relations Between Anger's and Weber's Function

**12.3.4** $\sin(\nu\pi)\,\mathbf{J}_\nu(z)=\cos(\nu\pi)\,\mathbf{E}_\nu(z)-\mathbf{E}_{-\nu}(z)$

**12.3.5** $\sin(\nu\pi)\,\mathbf{E}_\nu(z)=\mathbf{J}_{-\nu}(z)-\cos(\nu\pi)\,\mathbf{J}_\nu(z)$

### Relations Between Weber's Function and Struve's Function

If $n$ is a positive integer or zero,

**12.3.6** $$\mathbf{E}_n(z)=\frac{1}{\pi}\sum_{k=0}^{\left[\frac{n-1}{2}\right]}\frac{\Gamma(k+\frac{1}{2})(\frac{1}{2}z)^{n-2k-1}}{\Gamma(n+\frac{1}{2}-k)}-\mathbf{H}_n(z)\quad *$$

**12.3.7**

$$\mathbf{E}_{-n}(z)=\frac{(-1)^{n+1}}{\pi}\sum_{k=0}^{\left[\frac{n-1}{2}\right]}\frac{\Gamma(n-k-\frac{1}{2})(\frac{1}{2}z)^{-n+2k+1}}{\Gamma(k+\frac{3}{2})}-\mathbf{H}_{-n}(z)\quad *$$

---

*See page II.

**12.3.8** $$\mathbf{E}_0(z)=-\mathbf{H}_0(z)$$

**12.3.9** $$\mathbf{E}_1(z)=\frac{2}{\pi}-\mathbf{H}_1(z)$$

**12.3.10** $$\mathbf{E}_2(z)=\frac{2z}{3\pi}-\mathbf{H}_2(z)$$

## Numerical Methods

### 12.4. Use and Extension of the Tables

**Example 1.** Compute $\mathbf{L}_0(2)$ to 6D. From **Table 12.1** $I_0(2)-\mathbf{L}_0(2)=.342152$; from **Table 9.11** we have $I_0(2)=2.279585$ so that $\mathbf{L}_0(2)=1.937433$.

**Example 2.** Compute $\mathbf{H}_0(10)$ to 6D. From **Table 12.2** for $x^{-1}=.1$, $\mathbf{H}_0(10)-Y_0(10)=.063072$; from **Table 9.1** we have $Y_0(10)=.055671$. Thus, $\mathbf{H}_0(10)=.118743$.

**Example 3.** Compute $\int_0^x \mathbf{H}_0(t)dt$ for $x=6$ to 5D. Using **Tables 12.2, 11.1** and **4.2,** we have

$$\int_0^6 \mathbf{H}_0(t)dt=\int_0^6 Y_0(t)dt+\frac{2}{\pi}\ln 6+f_1(6)$$

$$=-.125951+(.636620)(1.791759)$$
$$+.816764$$

$$=1.83148$$

**Example 4.** Compute $\mathbf{H}_n(x)$ for $x=4$, $-n=0(1)8$ to 6S. From **Table 12.1** we have $\mathbf{H}_0(4)=.1350146$, $\mathbf{H}_1(4)=1.0697267$. Using **12.1.9** we find

$$\begin{array}{ll}
\mathbf{H}_{-1}(4)=-.433107 & \mathbf{H}_{-5}(4)=\phantom{-}.689652\\
\mathbf{H}_{-2}(4)=\phantom{-}.240694 & \mathbf{H}_{-6}(4)=-1.21906\\
\mathbf{H}_{-3}(4)=\phantom{-}.152624 & \mathbf{H}_{-7}(4)=\phantom{-}2.82066\\
\mathbf{H}_{-4}(4)=-.439789 & \mathbf{H}_{-8}(4)=-8.24933
\end{array}$$

**Example 5.** Compute $\mathbf{H}_n(x)$ for $x=4$, $n=0(1)10$ to 7S. Starting with the values of $\mathbf{H}_0(4)$ and $\mathbf{H}_1(4)$ and using **12.1.9** with forward recurrence, we get

$$\begin{array}{ll}
\mathbf{H}_0(4)=\phantom{1}.13501\ 46 & \mathbf{H}_6(4)\ =.05433\ 5\mathit{4}\\
\mathbf{H}_1(4)=1.06972\ 67 & \mathbf{H}_7(4)\ =.01510\ 3\mathit{7}\\
\mathbf{H}_2(4)=1.24867\ 51 & \mathbf{H}_8(4)\ =.00367\ \mathit{33}\\
\mathbf{H}_3(4)=\phantom{1}.85800\ 95 & \mathbf{H}_9(4)\ =.0008\mathit{0}\ \mathit{02}\\
\mathbf{H}_4(4)=\phantom{1}.42637\ 41 & \mathbf{H}_{10}(4)=.0001\mathit{8}\ \mathit{25}\\
\mathbf{H}_5(4)=\phantom{1}.16719\ 87 &
\end{array}$$

We note that for $n>6$ there is a rapid loss of significant figures. On the other hand using **12.1.3** for $x=4$ we find $\mathbf{H}_9(4)=.0007935729$, $\mathbf{H}_{10}(4)=.00015447630$ and backward recurrence with **12.1.9** gives

$$\begin{array}{ll}
\mathbf{H}_8(4)=.00367\ 1495 & \mathbf{H}_3(4)=\phantom{1}.85800\ 94\\
\mathbf{H}_7(4)=.01510\ 315 & \mathbf{H}_2(4)=1.24867\ 6\\
\mathbf{H}_6(4)=.05433\ 519 & \mathbf{H}_1(4)=1.06972\ 7\\
\mathbf{H}_5(4)=.16719\ 87 & \mathbf{H}_0(4)=\phantom{1}.13501\ 4\\
\mathbf{H}_4(4)=.42637\ 43 &
\end{array}$$

**Example 6.** Compute $\mathbf{L}_n(.5)$ for $n=0(1)5$ to 8S. From **12.2.1** we find $\mathbf{L}_5(.5)=9.6307462\times10^{-7}$, $\mathbf{L}_4(.5)=2.1212342\times10^{-5}$. Then, with **12.2.4** we get

$$\begin{array}{ll}
\mathbf{L}_3(.5)=3.82465\ 03\times10^{-4} & \mathbf{L}_1(.5)=.05394\ 2181\\
\mathbf{L}_2(.5)=5.36867\ 34\times10^{-3} & \mathbf{L}_0(.5)=.32724\ 068
\end{array}$$

**Example 7.** Compute $\mathbf{L}_n(.5)$ for $-n=0(1)5$ to 6S. From **Tables 12.1** and **9.8** we find $\mathbf{L}_0(.5)=.327240$, $\mathbf{L}_1(.5)=.053942$. Then employing **12.2.4** with backward recurrence we get

$$\begin{array}{ll}
\mathbf{L}_{-1}(.5)=\phantom{-1}.690562 & \mathbf{L}_{-4}(.5)=-75.1418\\
\mathbf{L}_{-2}(.5)=-1.16177 & \mathbf{L}_{-5}(.5)=1056.92\\
\mathbf{L}_{-3}(.5)=\phantom{-}7.43824 &
\end{array}$$

**Example 8.** Compute $\mathbf{L}_n(x)$ for $x=6$ and $-n=0(1)6$ to 8S. From **Tables 12.2** and **9.8** we find $\mathbf{L}_0(6)=67.124454$, $\mathbf{L}_1(6)=60.725011$. Using **12.2.4** we get

$$\begin{array}{ll}
\mathbf{L}_{-1}(6)=61.361631 & \mathbf{L}_{-4}(6)=16.626028\\
\mathbf{L}_{-2}(6)=46.776680 & \mathbf{L}_{-5}(6)=\phantom{1}7.984089\\
\mathbf{L}_{-3}(6)=30.159494 & \mathbf{L}_{-6}(6)=\phantom{1}3.32780
\end{array}$$

We note that there is no essential loss of accuracy until $n=-6$. However, if further values were necessary the recurrence procedure becomes unstable. To avoid the instability use the methods described in **Examples 5** and **6.**

$$\int_0^x [\mathbf{H}_0(t)-Y_0(t)]dt=\frac{2}{\pi}\ln x+f_1(x)$$

$$\int_0^x [\mathbf{L}_0(t)-I_0(t)]dt=\frac{2}{\pi}\ln x+f_2(x)$$

$$\int_x^\infty \left[\frac{\mathbf{H}_0(t)-Y_0(t)}{t}\right]dt=f_3(x)$$

$<x>$ = nearest integer to $x$.

Starting with $\mathbf{H}_0(x)$ and $\mathbf{H}_1(x)$, recurrence formula **12.1.9** may be used to generate $\mathbf{H}_n(x)$ for $n<0$. As long as $n<x/2$ (approx.), $\mathbf{H}_n(x)$ may be generated by forward recurrence. When $n>x/2$, forward recurrence is unstable. To avoid the instability, choose $n>>x$, compute $\mathbf{H}_k(x)$ and $\mathbf{H}_{k+1}(x)$ with **12.1.3**, and then use backward recurrence with **12.1.9**.

If $n>0$, $\mathbf{L}_n(x)$ must be generated by backward recurrence. If $n<0$, $\mathbf{L}_n(x)$ may be generated by backward recurrence as long as $\mathbf{L}_n(x)$ increases. If $n<0$ and $\mathbf{L}_n(x)$ is decreasing, forward recurrence should be used.

**See Examples 4–8.**

# 13. Confluent Hypergeometric Functions

## Mathematical Properties

### 13.1. Definitions of Kummer and Whittaker Functions

**Kummer's Equation**

**13.1.1** $$z\frac{d^2w}{dz^2}+(b-z)\frac{dw}{dz}-aw=0$$

It has a regular singularity at $z=0$ and an irregular singularity at $\infty$.

Independent solutions are

**Kummer's Function**

**13.1.2**

$$M(a,b,z)=1+\frac{az}{b}+\frac{(a)_2z^2}{(b)_22!}+\ldots+\frac{(a)_nz^n}{(b)_nn!}+\ldots$$

where

$$(a)_n=a(a+1)(a+2)\ldots(a+n-1),\ (a)_0=1,$$

and

**13.1.3**

$$U(a,b,z)=\frac{\pi}{\sin\pi b}\left\{\frac{M(a,b,z)}{\Gamma(1+a-b)\Gamma(b)}-z^{1-b}\frac{M(1+a-b,2-b,z)}{\Gamma(a)\Gamma(2-b)}\right\}$$

| *Parameters* (*m, n positive integers*) | | $M(a, b, z)$ |
|---|---|---|
| $b\neq-n$ | $a\neq-m$ | a convergent series for all values of $a$, $b$ and $z$ |
| $b\neq-n$ | $a=-m$ | a polynomial of degree $m$ in $z$ |
| $b=-n$ | $a\neq-m$ | |
| $b=-n$ | $a=-m$, $m>n$ | a simple pole at $b=-n$ |
| $b=-n$ | $a=-m$, $m\leq n$ | undefined |

$U(a, b, z)$ is defined even when $b\to\pm n$

As $|z|\to\infty$,

**13.1.4**

$$M(a,b,z)=\frac{\Gamma(b)}{\Gamma(a)}e^zz^{a-b}[1+O(|z|^{-1})]\qquad(\mathscr{R}z>0)$$

and

**13.1.5**

$$M(a,b,z)=\frac{\Gamma(b)}{\Gamma(b-a)}(-z)^{-a}[1+O(|z|^{-1})]\qquad(\mathscr{R}z<0)$$

$U(a, b, z)$ is a many-valued function. Its principal branch is given by $-\pi<\arg z\leq\pi$.

**Logarithmic Solution**

**13.1.6**

$$U(a,n+1,z)=\frac{(-1)^{n+1}}{n!\Gamma(a-n)}\Big[M(a,n+1,z)\ln z+\sum_{r=0}^{\infty}\frac{(a)_rz^r}{(n+1)_rr!}\{\psi(a+r)-\psi(1+r)-\psi(1+n+r)\}\Big]+\frac{(n-1)!}{\Gamma(a)}z^{-n}M(a-n,1-n,z)_n$$

for $n=0, 1, 2, \ldots$, where the last function is the sum to $n$ terms. It is to be interpreted as zero when $n=0$, and $\psi(a)=\Gamma'(a)/\Gamma(a)$.

**13.1.7** $U(a, 1-n, z)=z^nU(a+n, 1+n, z)$

As $\mathscr{R}z\to\infty$

**13.1.8** $$U(a, b, z)=z^{-a}[1+O(|z|^{-1})]$$

**Analytic Continuation**

**13.1.9**

$$U(a,b,ze^{\pm\pi i})=\frac{\pi}{\sin\pi b}e^{-z}\left\{\frac{M(b-a,b,z)}{\Gamma(1+a-b)\Gamma(b)}-\frac{e^{\pm\pi i(1-b)}z^{1-b}M(1-a,2-b,z)}{\Gamma(a)\Gamma(2-b)}\right\}$$

where either upper or lower signs are to be taken throughout.

**13.1.10**

$$U(a,b,ze^{2\pi in})=[1-e^{-2\pi ibn}]\frac{\Gamma(1-b)}{\Gamma(1+a-b)}M(a,b,z)+e^{-2\pi ibn}U(a,b,z)$$

**Alternative Notations**

${}_1F_1(a; b; z)$ or $\Phi(a; b; z)$ for $M(a, b, z)$

$z^{-a}{}_2F_0(a, 1+a-b; ;-1/z)$ or $\Psi(a; b; z)$ for $U(a, b, z)$

**Complete Solution**

**13.1.11** $y=AM(a, b, z)+BU(a, b, z)$

where $A$ and $B$ are arbitrary constants, $b\neq-n$.

**Eight Solutions**

**13.1.12** $y_1=M(a, b, z)$

**13.1.13** $y_2=z^{1-b}M(1+a-b, 2-b, z)$

**13.1.14** $y_3=e^zM(b-a, b, -z)$

**13.1.15** $y_4=z^{1-b}e^zM(1-a,\ 2-b,\ -z)$

**13.1.16** $y_5=U(a,\ b,\ z)$

**13.1.17** $y_6=z^{1-b}U(1+a-b,\ 2-b,\ z)$

**13.1.18** $y_7=e^zU(b-a,\ b,\ -z)$

**13.1.19** $y_8=z^{1-b}e^zU(1-a,\ 2-b,\ -z)$

### Wronskians

If $W\{m,\ n\}=y_my_n'-y_ny_m'$ and

$$\begin{aligned}\epsilon=sgn\ (\mathscr{I}z)&=1 \text{ if } \mathscr{I}z>0,\\ &=-1 \text{ if } \mathscr{I}z\leq 0\end{aligned}$$

**13.1.20**

$$W\{1,\ 2\}=W\{3,\ 4\}=W\{1,\ 4\}=-W\{2,\ 3\}=(1-b)z^{-b}e^z$$

**13.1.21**

$$W\{1,\ 3\}=W\{2,\ 4\}=W\{5,\ 6\}=W\{7,\ 8\}=0$$

**13.1.22** $W\{1,\ 5\}=-\Gamma(b)z^{-b}e^z/\Gamma(a)$

**13.1.23** $W\{1,\ 7\}=\Gamma(b)e^{\epsilon\pi ib}z^{-b}e^z/\Gamma(b-a)$

**13.1.24** $W\{2,\ 5\}=-\Gamma(2-b)z^{-b}e^z/\Gamma(1+a-b)$

**13.1.25** $W\{2,\ 7\}=-\Gamma(2-b)z^{-b}e^z/\Gamma(1-a)$

**13.1.26** $W\{5,\ 7\}=e^{\epsilon\pi i(b-a)}z^{-b}e^z$

### Kummer Transformations

**13.1.27** $M(a,\ b,\ z)=e^zM(b-a,\ b,\ -z)$

**13.1.28**

$$z^{1-b}M(1+a-b,\ 2-b,\ z)=z^{1-b}e^zM(1-a,\ 2-b,\ -z)$$

**13.1.29** $U(a,\ b,\ z)=z^{1-b}U(1+a-b,\ 2-b,\ z)$

**13.1.30**

$$e^zU(b-a,\ b,\ -z)=e^{\epsilon\pi i(1-b)}e^zz^{1-b}U(1-a,\ 2-b,\ -z)$$

### Whittaker's Equation

**13.1.31** $$\frac{d^2w}{dz^2}+\left[-\frac{1}{4}+\frac{\kappa}{z}+\frac{(\frac{1}{4}-\mu^2)}{z^2}\right]w=0$$

Solutions:

### Whittaker's Functions

**13.1.32** $M_{\kappa,\mu}(z)=e^{-\frac{1}{2}z}z^{\frac{1}{2}+\mu}M(\tfrac{1}{2}+\mu-\kappa,\ 1+2\mu,\ z)$

**13.1.33**

$$W_{\kappa,\mu}(z)=e^{-\frac{1}{2}z}z^{\frac{1}{2}+\mu}U(\tfrac{1}{2}+\mu-\kappa,\ 1+2\mu,\ z)$$

$$(-\pi<\arg z\leq\pi,\ \kappa=\tfrac{1}{2}b-a,\ \mu=\tfrac{1}{2}b-\tfrac{1}{2})$$

**13.1.34**

$$W_{\kappa,\mu}(z)=\frac{\Gamma(-2\mu)}{\Gamma(\frac{1}{2}-\mu-\kappa)}M_{\kappa,\mu}(z)+\frac{\Gamma(2\mu)}{\Gamma(\frac{1}{2}+\mu-\kappa)}M_{\kappa,-\mu}(z)$$

### General Confluent Equation

**13.1.35**

$$w''+\left[\frac{2A}{Z}+2f'+\frac{bh'}{h}-h'-\frac{h''}{h'}\right]w'$$
$$+\left[\left(\frac{bh'}{h}-h'-\frac{h''}{h'}\right)\left(\frac{A}{Z}+f'\right)+\frac{A(A-1)}{Z^2}\right.$$
$$\left.+\frac{2Af'}{Z}+f''+f'^2-\frac{ah'^2}{h}\right]w=0$$

Solutions:

**13.1.36** $Z^{-A}e^{-f(Z)}M(a,\ b,\ h(Z))$

**13.1.37** $Z^{-A}e^{-f(Z)}U(a,\ b,\ h(Z))$

## 13.2. Integral Representations

$$\mathscr{R}b>\mathscr{R}a>0$$

**13.2.1**

$$\frac{\Gamma(b-a)\Gamma(a)}{\Gamma(b)}M(a,b,z)=\int_0^1 e^{zt}t^{a-1}(1-t)^{b-a-1}dt$$

**13.2.2**

$$=2^{1-b}e^{\frac{1}{2}z}\int_{-1}^{+1}e^{-\frac{1}{2}zt}(1+t)^{b-a-1}(1-t)^{a-1}dt$$

**13.2.3**

$$=2^{1-b}e^{\frac{1}{2}z}\int_0^\pi e^{-\frac{1}{2}z\cos\theta}\sin^{b-1}\theta\cot^{b-2a}(\tfrac{1}{2}\theta)\,d\theta$$

**13.2.4**

$$=e^{-Az}\int_A^B e^{zt}(t-A)^{a-1}(B-t)^{b-a-1}dt \qquad (A=B-1)$$

$$\mathscr{R}a>0,\ \mathscr{R}z>0$$

**13.2.5**

$$\Gamma(a)U(a,b,z)=\int_0^\infty e^{-zt}t^{a-1}(1+t)^{b-a-1}dt$$

**13.2.6**

$$=e^z\int_1^\infty e^{-zt}(t-1)^{a-1}t^{b-a-1}dt$$

**13.2.7**

$$=2^{1-b}e^{\frac{1}{2}z}\int_0^\infty e^{-\frac{1}{2}z\cosh\theta}\sinh^{b-1}\theta\coth^{b-2a}(\tfrac{1}{2}\theta)d\theta \ *$$

---

*See page II.

**13.2.8** $\Gamma(a)U(a,b,z)$

$$=e^{Az}\int_A^\infty e^{-zt}(t-A)^{a-1}(t+B)^{b-a-1}dt \qquad (A=1-B)$$

Similar integrals for $M_{\kappa,\mu}(z)$ and $W_{\kappa,\mu}(z)$ can be deduced with the help of **13.1.32** and **13.1.33.**

### Barnes-type Contour Integrals

**13.2.9**

$$\frac{\Gamma(a)}{\Gamma(b)}M(a,b,z)=\frac{1}{2\pi i}\int_{c-i\infty}^{c+i\infty}\frac{\Gamma(-s)\Gamma(a+s)}{\Gamma(b+s)}(-z)^s ds$$

for $|\arg(-z)|<\frac{1}{2}\pi$, $a, b\neq 0, -1, -2, \ldots$. The contour must separate the poles of $\Gamma(-s)$ from those of $\Gamma(a+s)$; $c$ is finite.

**13.2.10**

$$\Gamma(a)\Gamma(1+a-b)z^a U(a,b,z)$$
$$=\frac{1}{2\pi i}\int_{c-i\infty}^{c+i\infty}\Gamma(-s)\Gamma(a+s)\Gamma(1+a-b+s)z^{-s}ds$$

for $|\arg z|<\frac{3\pi}{2}$, $a\neq 0, -1, -2, \ldots$, $b-a\neq 1, 2, 3, \ldots$. The contour must separate the poles of $\Gamma(-s)$ from those of $\Gamma(a+s)$ and $\Gamma(1+a-b+s)$.

## 13.3. Connections With Bessel Functions
(see chapters **9** and **10**)

### Bessel Functions as Limiting Cases

If $b$ and $z$ are fixed,

**13.3.1** $\lim\limits_{a\to\infty}\{M(a,b,z/a)/\Gamma(b)\}=z^{\frac{1}{2}-\frac{1}{2}b}I_{b-1}(2\sqrt{z})$

**13.3.2** $\lim\limits_{a\to\infty}\{M(a,b,-z/a)/\Gamma(b)\}=z^{\frac{1}{2}-\frac{1}{2}b}J_{b-1}(2\sqrt{z})$

**13.3.3**

$$\lim_{a\to\infty}\{\Gamma(1+a-b)\,U(a,b,z/a)\}=2z^{\frac{1}{2}-\frac{1}{2}b}K_{b-1}(2\sqrt{z})$$

**13.3.4**

$$\lim_{a\to\infty}\{\Gamma(1+a-b)U(a,b,-z/a)\}$$
$$=-\pi i e^{\pi i b}z^{\frac{1}{2}-\frac{1}{2}b}H_{b-1}^{(1)}(2\sqrt{z}) \qquad (\mathscr{I}z>0)$$

**13.3.5** $=\pi i e^{-\pi i b}z^{\frac{1}{2}-\frac{1}{2}b}H_{b-1}^{(2)}(2\sqrt{z}) \qquad (\mathscr{I}z<0)$

### Expansions in Series

**13.3.6**

$$M(a,b,z)=e^{\frac{1}{2}z}\Gamma\left(b-a-\tfrac{1}{2}\right)\left(\tfrac{1}{4}z\right)^{a-b+\frac{1}{2}}$$

* $$\cdot\sum_{n=0}^{\infty}\frac{(2b-2a-1)_n(b-2a)_n(b-a-\frac{1}{2}+n)}{n!(b)_n}(-1)^n I_{b-a-\frac{1}{2}+n}\left(\tfrac{1}{2}z\right)\quad(b\neq 0,-1,-2,\ldots)$$

**13.3.7**

$$\frac{M(a,b,z)}{\Gamma(b)}=e^{\frac{1}{2}z}\left(\tfrac{1}{2}bz-az\right)^{\frac{1}{2}-\frac{1}{2}b}$$
$$\cdot\sum_{n=0}^{\infty}A_n\left(\tfrac{1}{2}z\right)^{\frac{1}{2}n}(b-2a)^{-\frac{1}{2}n}J_{b-1+n}\left(\sqrt{(2zb-4za)}\right)$$

where

$A_0=1, A_1=0, A_2=\frac{1}{2}b,$

$(n+1)A_{n+1}=(n+b-1)A_{n-1}+(2a-b)A_{n-2}, \qquad (a \text{ real})$

**13.3.8**

$$\frac{M(a,b,z)}{\Gamma(b)}$$
$$=e^{hz}\sum_{n=0}^{\infty}C_n z^n(-az)^{\frac{1}{2}(1-b-n)}J_{b-1+n}\left(2\sqrt{(-az)}\right)$$

where

$C_0=1,\ C_1=-bh,\ C_2=-\frac{1}{2}(2h-1)a+\frac{1}{2}b(b+1)h^2,$

$(n+1)C_{n+1}=[(1-2h)n-bh]C_n$

$+[(1-2h)a-h(h-1)(b+n-1)]C_{n-1}$

$-h(h-1)aC_{n-2} \qquad (h \text{ real})$

**13.3.9** $M(a,b,z)=\sum\limits_{n=0}^{\infty}C_n(a,b)I_n(z)$

where

$C_0=1,\ C_1(a,b)=2a/b,$

$C_{n+1}(a,b)=2aC_n(a+1,b+1)/b-C_{n-1}(a,b)$

## 13.4. Recurrence Relations and Differential Properties

**13.4.1**

$$(b-a)M(a-1,b,z)+(2a-b+z)M(a,b,z)-aM(a+1,b,z)=0$$

**13.4.2**

$$b(b-1)M(a,b-1,z)+b(1-b-z)M(a,b,z)+z(b-a)M(a,b+1,z)=0$$

**13.4.3**

$$(1+a-b)M(a,b,z)-aM(a+1,b,z)+(b-1)M(a,b-1,z)=0$$

**13.4.4**

$$bM(a,b,z)-bM(a-1,b,z)-zM(a,b+1,z)=0$$

**13.4.5**

$$b(a+z)M(a,b,z)+z(a-b)M(a,b+1,z)-abM(a+1,b,z)=0$$

**13.4.6**

$$\begin{aligned}(a-1+z)M(a, b, z)+(b-a)M(a-1, b, z)\\ +(1-b)M(a, b-1, z)=0\end{aligned}$$

**13.4.7**

$$\begin{aligned}b(1-b+z)M(a, b, z)+b(b-1)M(a-1, b-1, z)\\ -azM(a+1, b+1, z)=0\end{aligned}$$

**13.4.8** $$M'(a, b, z)=\frac{a}{b}M(a+1, b+1, z)$$

**13.4.9** $$\frac{d^n}{dz^n}\{M(a, b, z)\}=\frac{(a)_n}{(b)_n}M(a+n, b+n, z)$$

**13.4.10** $$aM(a+1, b, z)=aM(a, b, z)+zM'(a, b, z)$$

**13.4.11**

$$\begin{aligned}(b-a)M(a-1, b, z)=(b-a-z)M(a, b, z)\\ +zM'(a, b, z)\end{aligned}$$

**13.4.12**

$$(b-a)M(a, b+1, z)=bM(a, b, z)-bM'(a, b, z)$$

**13.4.13**

$$\begin{aligned}(b-1)M(a, b-1, z)=(b-1)M(a, b, z)\\ +zM'(a, b, z)\end{aligned}$$

**13.4.14**

$$\begin{aligned}(b-1)M(a-1, b-1, z)=(b-1-z)M(a, b, z)\\ +zM'(a, b, z)\end{aligned}$$

**13.4.15**

$$\begin{aligned}U(a-1, b, z)+(b-2a-z)U(a, b, z)\\ +a(1+a-b)U(a+1, b, z)=0\end{aligned}$$

**13.4.16**

$$\begin{aligned}(b-a-1)U(a, b-1, z)+(1-b-z)U(a, b, z)\\ +zU(a, b+1, z)=0\end{aligned}$$

**13.4.17**

$$U(a, b, z)-aU(a+1, b, z)-U(a, b-1, z)=0$$

**13.4.18**

$$\begin{aligned}(b-a)U(a, b, z)+U(a-1, b, z)\\ -zU(a, b+1, z)=0\end{aligned}$$

**13.4.19**

$$\begin{aligned}(a+z)U(a, b, z)-zU(a, b+1, z)\\ +a(b-a-1)U(a+1, b, z)=0\end{aligned}$$

**13.4.20**

$$\begin{aligned}(a+z-1)U(a, b, z)-U(a-1, b, z)\\ +(1+a-b)U(a, b-1, z)=0\end{aligned}$$

**13.4.21** $$U'(a, b, z)=-aU(a+1, b+1, z)$$

**13.4.22**

$$\frac{d^n}{dz^n}\{U(a, b, z)\}=(-1)^n(a)_nU(a+n, b+n, z)$$

**13.4.23**

$$\begin{aligned}a(1+a-b)U(a+1, b, z)=aU(a, b, z)\\ +zU'(a, b, z)\end{aligned}$$

**13.4.24**

$$\begin{aligned}(1+a-b)U(a, b-1, z)=(1-b)U(a, b, z)\\ -zU'(a, b, z)\end{aligned}$$

**13.4.25** $$U(a, b+1, z)=U(a, b, z)-U'(a, b, z)$$

**13.4.26**

$$U(a-1, b, z)=(a-b+z)U(a, b, z)-zU'(a, b, z)$$

**13.4.27**

$$\begin{aligned}U(a-1, b-1, z)=(1-b+z)U(a, b, z)\\ -zU'(a, b, z)\end{aligned}$$

**13.4.28** $$2\mu M_{\kappa-\frac{1}{2},\mu-\frac{1}{2}}(z)-z^{\frac{1}{2}}M_{\kappa,\mu}(z)=2\mu M_{\kappa+\frac{1}{2},\mu-\frac{1}{2}}(z)$$

**13.4.29**

$$\begin{aligned}(1+2\mu+2\kappa)M_{\kappa+1,\mu}(z)-(1+2\mu-2\kappa)M_{\kappa-1,\mu}(z)\\ =2(2\kappa-z)M_{\kappa,\mu}(z)\end{aligned}$$

**13.4.30**

$$W_{\kappa+\frac{1}{2},\mu}(z)-z^{\frac{1}{2}}W_{\kappa,\mu+\frac{1}{2}}(z)+(\kappa+\mu)W_{\kappa-\frac{1}{2},\mu}(z)=0$$

**13.4.31**

$$\begin{aligned}(2\kappa-z)W_{\kappa,\mu}(z)+W_{\kappa+1,\mu}(z)\\ =(\mu-\kappa+\tfrac{1}{2})(\mu+\kappa-\tfrac{1}{2})W_{\kappa-1,\mu}(z)\end{aligned}$$

**13.4.32**

$$zM'_{\kappa,\mu}(z)=(\tfrac{1}{2}z-\kappa)M_{\kappa,\mu}(z)+(\tfrac{1}{2}+\mu+\kappa)M_{\kappa+1,\mu}(z)$$

**13.4.33** $$zW'_{\kappa,\mu}(z)=(\tfrac{1}{2}z-\kappa)W_{\kappa,\mu}(z)-W_{\kappa+1,\mu}(z)$$

## 13.5. Asymptotic Expansions and Limiting Forms

**For $|z|$ large, ($a$, $b$ fixed)**

**13.5.1**

$$\frac{M(a,b,z)}{\Gamma(b)}=$$
$$\frac{e^{\pm i\pi a}z^{-a}}{\Gamma(b-a)}\left\{\sum_{n=0}^{R-1}\frac{(a)_n(1+a-b)_n}{n!}(-z)^{-n}+O(|z|^{-R})\right\}$$
$$+\frac{e^z z^{a-b}}{\Gamma(a)}\left\{\sum_{n=0}^{S-1}\frac{(b-a)_n(1-a)_n}{n!}z^{-n}+O(|z|^{-S})\right\}$$

the upper sign being taken if $-\frac{1}{2}\pi<\arg z<\frac{3}{2}\pi$, the lower sign if $-\frac{3}{2}\pi<\arg z\leq-\frac{1}{2}\pi$.

**13.5.2**

$$U(a,b,z)=z^{-a}\left\{\sum_{n=0}^{R-1}\frac{(a)_n(1+a-b)_n}{n!}(-z)^{-n}+O(|z|^{-R})\right\}\quad\left(-\tfrac{3}{2}\pi<\arg z<\tfrac{3}{2}\pi\right)$$

**Converging Factors for the Remainders**

**13.5.3**

$$O(|z|^{-R})=\frac{(a)_R(1+a-b)_R}{R!}(-z)^{-R}\left[\tfrac{1}{2}+\frac{\left(\frac{1}{8}+\frac{1}{4}b-\frac{1}{2}a+\frac{1}{4}z-\frac{1}{4}R\right)}{z}+O(|z|^{-2})\right]$$

and

**13.5.4**

$$O(|z|^{-S})=\frac{(b-a)_S(1-a)_S}{S!}z^{-S}\left[\tfrac{2}{3}-b+2a+z-S+O(|z|^{-1})\right]$$

where the $R$'th and $S$'th terms are the smallest in the expansions 13.5.1 and 13.5.2.

**For small $z$ ($a$, $b$ fixed)**

**13.5.5** As $|z|\to 0$, $M(a,b,0)=1$, $b\neq -n$

**13.5.6** $$U(a,b,z)=\frac{\Gamma(b-1)}{\Gamma(a)}z^{1-b}+O(|z|^{\mathscr{R}b-2})\qquad(\mathscr{R}b\geq 2,\, b\neq 2)$$

**13.5.7** $$=\frac{\Gamma(b-1)}{\Gamma(a)}z^{1-b}+O(|\ln z|)\qquad(b=2)$$

**13.5.8** $$=\frac{\Gamma(b-1)}{\Gamma(a)}z^{1-b}+O(1)\qquad(1<\mathscr{R}b<2)$$

***13.5.9** $$=-\frac{1}{\Gamma(a)}[\ln z+\psi(a)+2\gamma]+O(|z\ln z|)\qquad(b=1)$$

**13.5.10** $$U(a,b,z)=\frac{\Gamma(1-b)}{\Gamma(1+a-b)}+O(|z|^{1-\mathscr{R}b})\qquad(0<\mathscr{R}b<1)$$

**13.5.11** $$=\frac{1}{\Gamma(1+a)}+O(|z\ln z|)\qquad(b=0)$$

**13.5.12** $$=\frac{\Gamma(1-b)}{\Gamma(1+a-b)}+O(|z|)\qquad(\mathscr{R}b\leq 0,\, b\neq 0)$$

**For large $a$ ($b$, $z$ fixed)**

**13.5.13**

$$M(a,b,z)=\Gamma(b)e^{\frac{1}{2}z}\left(\tfrac{1}{2}bz-az\right)^{\frac{1}{2}-\frac{1}{2}b}J_{b-1}\left(\sqrt{(2bz-4az)}\right)\left[1+O\left(\left|\tfrac{1}{2}b-a\right|^{-\sigma}\right)\right]$$

where

$|z|=\left|\frac{1}{2}b-a\right|^{\rho}$ and $\sigma=\min\left(1-\rho,\ \frac{1}{2}-\frac{3}{2}\rho\right)$, $0\leq\rho<\frac{1}{3}$.

**13.5.14**

$$M(a,b,x)=\Gamma(b)e^{\frac{1}{2}x}\left(\tfrac{1}{2}bx-ax\right)^{\frac{1}{4}-\frac{1}{2}b}\pi^{-\frac{1}{2}}\cos\left(\sqrt{(2bx-4ax)}-\tfrac{1}{2}b\pi+\tfrac{1}{4}\pi\right)\left[1+O\left(\left|\tfrac{1}{2}b-a\right|^{-\frac{1}{2}}\right)\right]$$

as $a\to-\infty$ for $b$ bounded, $x$ real.

**13.5.15**

$$U(a,b,z)=\Gamma\left(\tfrac{1}{2}b-a+\tfrac{1}{2}\right)e^{\frac{1}{2}z}z^{\frac{1}{2}-\frac{1}{2}b}\left[\cos(a\pi)J_{b-1}\left(\sqrt{(2bz-4az)}\right)-\sin(a\pi)Y_{b-1}\left(\sqrt{(2bz-4az)}\right)\right]\left[1+O\left(\left|\tfrac{1}{2}b-a\right|^{-\sigma}\right)\right]$$

where $\sigma$ is defined in **13.5.13.**

**13.5.16**

$$U(a,b,x)=\Gamma\left(\tfrac{1}{2}b-a+\tfrac{1}{4}\right)\pi^{-\frac{1}{2}}e^{\frac{1}{2}x}x^{\frac{1}{4}-\frac{1}{2}b}\cos\left(\sqrt{(2bx-4ax)}-\tfrac{1}{2}b\pi+a\pi+\tfrac{1}{4}\pi\right)\left[1+O\left(\left|\tfrac{1}{2}b-a\right|^{-\frac{1}{2}}\right)\right]$$

as $a\to-\infty$ for $b$ bounded, $x$ real.

**For large real $a$, $b$, $x$**

If $\cosh^2\theta=x/(2b-4a)$ so that $x>2b-a>1$,

**13.5.17**

$$M(a,b,x)=\Gamma(b)\sin(a\pi)\exp\left[(b-2a)\left(\tfrac{1}{4}\sinh 2\theta-\theta+\cosh^2\theta\right)\right]\left[(b-2a)\cosh\theta\right]^{1-b}\left[\pi\left(\tfrac{1}{2}b-a\right)\sinh 2\theta\right]^{-\frac{1}{2}}\left[1+O\left(\left|\tfrac{1}{2}b-a\right|^{-1}\right)\right]$$

**13.5.18**

$$U(a,b,x)=\exp\left[(b-2a)\left(\tfrac{1}{4}\sinh 2\theta-\theta+\cosh^2\theta\right)\right]\left[(b-2a)\cosh\theta\right]^{1-b}\left[\left(\tfrac{1}{2}b-a\right)\sinh 2\theta\right]^{-\frac{1}{2}}\left[1+O\left(\left|\tfrac{1}{2}b-a\right|^{-1}\right)\right]$$

---

*See page II.

If $x=(2b-4a)[1+t/(b-2a)^{\frac{1}{3}}]$, so that

$$x\sim 2b-4a$$

**13.5.19**

$$M(a, b, x)=e^{\frac{1}{2}x}(b-2a)^{\frac{1}{3}-b}\Gamma(b)[\mathrm{Ai}(t)\cos(a\pi)$$
$$+\mathrm{Bi}(t)\sin(a\pi)+O(|\tfrac{1}{2}b-a|^{-\frac{2}{3}})]$$

**13.5.20**

$$U(a, b, x)=e^{\frac{1}{2}x+a-\frac{1}{2}b}\Gamma(\tfrac{1}{3})\pi^{-1}x6^{-\frac{1}{3}}$$
$$\{1-t\Gamma(\tfrac{5}{6})(bx-2ax)^{-\frac{1}{3}}3^{\frac{1}{3}}\pi^{-\frac{1}{2}}+O(|\tfrac{1}{2}b-a|^{-\frac{2}{3}})\}$$

If $\cos^2\theta=x/(2b-4a)$ so that $2b-4a>x>0$,

**13.5.21**

$$M(a, b, x)=\Gamma(b)\exp\{(b-2a)\cos^2\theta\}$$
$$[(b-2a)\cos\theta]^{1-b}[\pi(\tfrac{1}{2}b-a)\sin 2\theta]^{-\frac{1}{2}}$$
$$[\sin(a\pi)+\sin\{(\tfrac{1}{2}b-a)(2\theta-\sin 2\theta)+\tfrac{1}{4}\pi\}$$
$$+O(|\tfrac{1}{2}b-a|^{-1})]$$

**13.5.22**

$$U(a, b, x)=\exp[(b-2a)\cos^2\theta][(b-2a)\cos\theta]^{1-b}$$
$$[(\tfrac{1}{2}b-a)\sin 2\theta]^{-\frac{1}{2}}\{\sin[(\tfrac{1}{2}b-a)$$
$$(2\theta-\sin 2\theta)+\tfrac{1}{4}\pi]+O(|\tfrac{1}{2}b-a|^{-1})\}$$

## 13.6. Special Cases

| | $M(a, b, z)$ | | | Relation | Function |
|---|---|---|---|---|---|
| | $a$ | $b$ | $z$ | | |

## 13.7. Zeros and Turning Values

If $j_{b-1,r}$ is the $r$'th positive zero of $J_{b-1}(x)$, then a first approximation $X_0$ to the $r$'th positive zero of $M(a, b, x)$ is

**13.7.1** $$X_0=j^2_{b-1,r}\{1/(2b-4a)+O(1/(\tfrac{1}{2}b-a)^2)\}$$

**13.7.2** $$X_0\approx\frac{\pi^2(r+\frac{1}{2}b-\frac{1}{4})^2}{2b-4a}$$

A closer approximation is given by

**13.7.3** $$X_1=X_0-M(a,b,X_0)/M'(a,b,X_0)$$

For the derivative,

**13.7.4**

$$M'(a,b,X_1)=M'(a,b,X_0)\{1+(b-X_0)\frac{M(a,b,X_0)}{M'(a,b,X_0)}\}$$

If $X_0'$ is the first approximation to a turning value of $M(a, b, x)$, that is, to a zero of $M'(a, b, x)$ then a better approximation is

**13.7.5** $$X_1'=X_0'-\frac{X_0'M'(a,b,X_0')}{aM(a,b,X_0')}$$

---

*See page II.

The self-adjoint equation **13.1.1** can also be written

**13.7.6** $$\frac{d}{dz}[z^b e^{-z}\frac{dw}{dz}]=az^{b-1}e^{-z}w$$

#### The Sonine-Polya Theorem

The maxima and minima of $|w|$ form an increasing or decreasing sequence according as

$$-ax^{2b-1}e^{-2x}$$

is an increasing or decreasing function of $x$, that is, they form an increasing sequence for $M(a, b, x)$ if $a>0$, $x<b-\frac{1}{2}$ or if $a<0$, $x>b-\frac{1}{2}$, and a decreasing sequence if $a>0$ and $x>b-\frac{1}{2}$ or if $a<0$ and $x<b-\frac{1}{2}$.

The turning values of $|w|$ lie near the curves

**13.7.7**

$$w=\pm\Gamma(b)\pi^{-1/2}e^{x/2}(\tfrac{1}{2}bx-ax)^{\frac{1}{4}-\frac{1}{2}b}\{1-x/(2b-4a)\}^{-1/4}$$

## Numerical Methods

### 13.8. Use and Extension of the Tables

#### Calculation of *M(a, b, x)*

#### Kummer's Transformation

**Example 1.** Compute $M(.3, .2, -.1)$ to 7S. Using **13.1.27** and **Tables 4.4** and **13.1** we have $a=.3$, $b=.2$ so that

$$M(.3, .2, -.1)=e^{-.1}M(-.1, .2, .1)$$
$$=.85784\ 90.$$

Thus **13.1.27** can be used to extend **Table 13.1** to negative values of $x$. Kummer's transformation should also be used when $a$ and $b$ are large and nearly equal, for $x$ large or small.

**Example 2.** Compute $M(17, 16, 1)$ to 7S. Here $a=17$, $b=16$, and

$$M(17, 16, 1)=e^1M(-1, 16, -1)$$
$$=2.71828\ 18\times 1.06250\ 00$$
$$=2.88817\ 44.$$

#### Recurrence Relations

**Example 3.** Compute $M(-1.3, 1.2, .1)$ to 7S. Using **13.4.1** and **Table 13.1** we have $a=-.3$, $b=.2$ so that

$$M(-1.3, .2, .1)=2[.7\,M(-.3, .2, .1)-.3\,M(.7, .2, .1)]$$
$$=.35821\ 23.$$

By **13.4.5** when $a=-1.3$ and $b=.2$,

$$M(-1.3, 1.2, .1)=[.26\,M(-.3, .2, .1)$$
$$-.24\,M(-1.3, .2, .1)]/.15$$
$$=.89241\ 08.$$

Similarly when $a=-.3$ and $b=.2$

$$M(-.3, 1.2, .1)=.97459\ 52.$$

Check, by **13.4.6,**

$$M(-1.3, 1.2, .1)=[.2\,M(-.3, .2, .1)$$
$$+1.2\,M(-.3, 1.2, .1)]/1.5$$
$$=.89241\ 08.$$

In this way **13.4.1–13.4.7** can be used together with **13.1.27** to extend **Table 13.1** to the range

$$-10\leq a\leq 10,\ -10\leq b\leq 10,\ -10\leq x\leq 10.$$

This extension of ten units in any direction is possible with the loss of about 1S. All the recurrence relations are stable except i) if $a<0$, $b<0$ and $|a|>|b|$, $x>0$, or ii) $b<a$, $b<0$, $|b-a|>|b|$, $x<0$, when the oscillations may become large, especially if $|x|$ also is large.

Neither interpolation nor the use of recurrence relations should be attempted in the strips $b=-n\pm.1$ where the function is very large numerically. In particular $M(a, b, x)$ cannot be evaluated in the neighborhood of the points $a=-m$, $b=-n$, $m\leq n$, as near these points small changes in $a$, $b$ or $x$ can produce very large changes in the numerical value of $M(a, b, x)$.

**Example 4.** At the point $(-1, -1, x)$, $M(a, b, x)$ is undefined.

When $a=-1$, $M(-1, b, x)=1-\frac{x}{b}$ for all $x$.

Hence $\lim\limits_{b\to -1} M(-1, b, x)=1+x$. But $M(b, b, x)=e^x$ for all $x$, when $a=b$. Hence $\lim\limits_{b\to -1} M(b, b, x)=e^x$. In the first case $b\to -1$ along the line $a=-1$, and in the second case $b\to -1$ along the line $a=b$.

#### Derivatives

**Example 5.** To evaluate $M'(-.7, -.6, .5)$ to 7S. By **13.4.8,** when $a=-.7$ and $b=-.6$, we have

$$M'(-.7, -.6, .5)=\frac{-.7}{-.6}M(.3, .4, .5)$$
$$=1.724128.$$

#### Asymptotic Formulas

For $x\geq 10$, $a$ and $b$ small, $M(a, b, x)$ should be evaluated by **13.5.1** using converging factors **13.5.3** and **13.5.4** to improve the accuracy if necessary.

**Example 6.** Calculate $M(.9,\ .1,\ 10)$ to 7S, using **13.5.1.**

$$M(.9,.1,10)=\frac{\Gamma(.1)}{\Gamma(-.8)}\,e^{.9\pi i}10^{-.9}\sum_{n=0}^{N}\frac{(.9)_n(1.8)_n}{n!(-10)^n}$$

$$+\frac{\Gamma(.1)}{\Gamma(.9)}\,e^{10}10^{.8}\sum_{n=0}^{N}\frac{(-.8)_n(.1)_n}{n!10^n}+O(10^{-N})$$

$$=-.198(.869)+1237253(.99190\ 285)+O(1)$$

$$=1227235.23-.17+O(1)$$

$$=1227235+O(1)$$

Check, from **Table 13.1,** $M(.9,\ .1,\ 10)=1227235$. To evaluate $M(a,\ b,\ x)$ with $a$ large, $x$ small and $b$ small or large **13.5.13–14** should be used.

**Example 7.** Compute $M(-52.5,\ .1,\ 1)$ to 3S, using **13.5.14.**

$$M(-52.5,\ .1,\ 1)=\Gamma(.1)e^{.5}(.05+52.5)^{.25-.05}$$

$$.5642\cos\left[(.2-4(-52.5))^{.5}-.05\pi+.25\pi\right]$$

$$\left[1+O((.05+52.5)^{-.5})\right]=-16.34+O(.2)$$

By direct application of a recurrence relation, $M(-52.5,\ .1,\ 1)$ has been calculated as $-16.447$. To evaluate $M(a,\ b,\ x)$ with $x$, $a$ and/or $b$ large, **13.5.17, 19** or **21** should be tried.

**Example 8.** Compute $M(-52.5,\ .1,\ 1)$ using **13.5.21** to 3S, $\cos\theta=\sqrt{1/210.2}$.

$$M(-52.5,\ .1,\ 1)$$

$$=\Gamma(.1)e^{105.1\cos^2\theta}[105.1\cos\theta]^{1-.1}.5641$$

$$52.55^{-\frac{1}{2}}\sin 2\theta^{-\frac{1}{2}}[\sin(-52.5\pi)$$

$$+\sin\{52.55(2\theta-\sin 2\theta)+\tfrac{1}{4}\pi\}$$

$$+O((52.55)^{-1})]=-16.47+O(.02)$$

A full range of asymptotic formulas to cover all possible cases is not yet known.

### Calculation of $U(a,\ b,\ x)$

For $-10\leq x\leq 10$, $-10\leq a\leq 10$, $-10\leq b\leq 10$ this is possible by **13.1.3,** using **Table 13.1** and the recurrence relations **13.4.15–20.**

**Example 9.** Compute $U(1.1,\ .2,\ 1)$ to 5S. Using **Tables 13.1, 4.12** and **6.1** and **13.1.3,** we have

$$U(.1,\ .2,\ 1)=$$

$$\frac{\pi}{\sin(.2\pi)}\left\{\frac{M(.1,.2,1)}{\Gamma(.9)\Gamma(.2)}-\frac{M(.9,1.8,1)}{\Gamma(.1)\Gamma(1.8)}\right\}.$$

But $M(.9,\ 1.8,\ 1)=.8[M(.9,\ .8,\ 1)-M(-.1,\ .8,\ 1)]$
$=1.72329$, using **13.4.4.**

Hence

$$U(.1,\ .2,\ 1)=5.344799(.371765-.194486)$$
$$=.94752.$$

Similarly

$$U(-.9,\ .2,\ 1)=.91272.$$

Hence by **13.4.15**

$$U(1.1,\ .2,\ 1)=[U(.1,\ .2,\ 1)-U(-.9,\ .2,\ 1)]/.09$$
$$=.38664.$$

**Example 10.** To compute $U'(-.9,\ -.8,\ 1)$ to 5S. By **13.4.21**

$$U'(-.9,\ -.8,\ 1)=.9U(.1,\ .2,\ 1)$$
$$=(.9)(.94752)$$
$$=.85276.$$

### Asymptotic Formulas

**Example 11.** To compute $U(1,\ .1,\ 100)$ to 5S. By **13.5.2**

$$U(1,.1,100)=\frac{1}{100}\left\{1-\frac{1.9}{100}+\frac{1.9}{100}\frac{2.9}{100}\right.$$

$$\left.-\frac{1.9}{100}\frac{2.9}{100}\frac{3.9}{100}+O(10^{-9})\right\}.$$

$$=.01\{1-.019+.000551-.000021+O(10^{-9})\},$$

$$=.00981\ 53.$$

**Example 12.** To evaluate $U(.1,\ .2,\ .01)$. For $x$ small, **13.5.6–12** should be used.

$$U(.1,.2,.01)=\frac{\Gamma(1-.2)}{\Gamma(1.1-.2)}+O((.01)^{1-.2})$$

$$=\frac{\Gamma(.8)}{\Gamma(.9)}+O((.01)^{.8})$$

$=1.09$ to 3S, by **13.5.10.**

To evaluate $U(a,\ b,\ x)$ with $a$ large, $x$ small and $b$ small or large **13.5.15** or **16** should be used.

To evaluate $U(a,\ b,\ x)$ with $x$, $a$ and/or $b$ large **13.5.18, 20** or **22** should be tried. In all these cases the size of the remainder term is the guide to the number of significant figures obtainable.

### Calculation of the Whittaker Functions

**Example 13.** Compute $M_{.0,-.4}(1)$ and $W_{.0,-.4}(1)$ to 5S. By formulas **13.1.32** and **13.1.33** and **Tables 13.1, 4.4**

$$M_{.0,-.4}(1)=e^{-.5}M(.1,\ .2,\ 1)=1.10622,$$
$$W_{.0,-.4}(1)=e^{-.5}U(.1,\ .2,\ 1)=.57469.$$

Thus the values of $M_{\kappa,\mu}(x)$ and $W_{\kappa,\mu}(x)$ can always be found if the values of $M(a, b, x)$ and $U(a, b, x)$ are known.

## 13.9. Calculation of Zeros and Turning Points

**Example 14.** Compute the smallest positive zero of $M(-4, .6, x)$. This is outside the range of **Table 13.2.** Using **13.7.2** we have, as a first approximation

$$X_0=\frac{(.55\pi)^2}{17.2}=.174.$$

Using **13.7.3** we have

$$X_1=X_0-M(-4, .6, X_0)/M'(-4, .6, X_0).$$

But, by **13.4.8,**

$$M'(-4, .6, X_0)=-(.15)^{-1}M(-3, 1.6, X_0)$$

Hence

$$X_1=X_0+.15M(-4, .6, X_0)/M(-3, 1.6, X_0),$$

$$=.174+(.15)(.030004)$$

$$=.17850 \text{ as a second approximation.}$$

If we repeat this calculation, we find that

$$X_2=X_1+.00002\,99=.17852\,99 \text{ to 7S.}$$

### Calculation of Maxima and Minima

**Example 15.** Compute the value of $x$ at which $M(-1.8, -.2, x)$ has a turning value. Using **13.4.8** and **Table 13.2,** we find that $M'(-1.8, -.2, x)=9M(-.8, .8, x)=0$ when $x=.94291\,59$. Also $M''(-1.8, -.2, x)=9M'(-.8, .8, x)=-9M(.2, 1.8, x)$ and $M(.2, 1.8, .94291\,59)>0$. Hence $M(-1.8, -.2, x)$ has a maximum in $x$ when $x=.94291\,59$.

**Example 16.** Compute the smallest positive value of $x$ for which $M(-3, .6, x)$ has a turning value, $X_1'$. This is outside the range of **Table 13.2.** Using **13.4.8** we have

$$M'(-3, .6, x)=-3M(-2, 1.6, x)/.6.$$

By 13.7.2 for $M(-2, 1.6, x)$,

$$X_0=(1.05\pi)^2/(11.2)=.9715.$$

This is a first approximation to $X_0'$ for $M(-3, .6, x)$. Using **13.7.5** and **13.4.8** we find a second approximation

$$X_1'=X_0'\left[1-\frac{M'(-3, .6, X_0')}{-3M(-3, .6, X_0')}\right]$$

$$=X_0'[1-M(-2, 1.6, X_0')/.6M(-3, .6, X_0')]$$

$$=.9715\times1.0163=.9873 \text{ to 4S.}$$

This process can be repeated to give as many significant figures as are required.

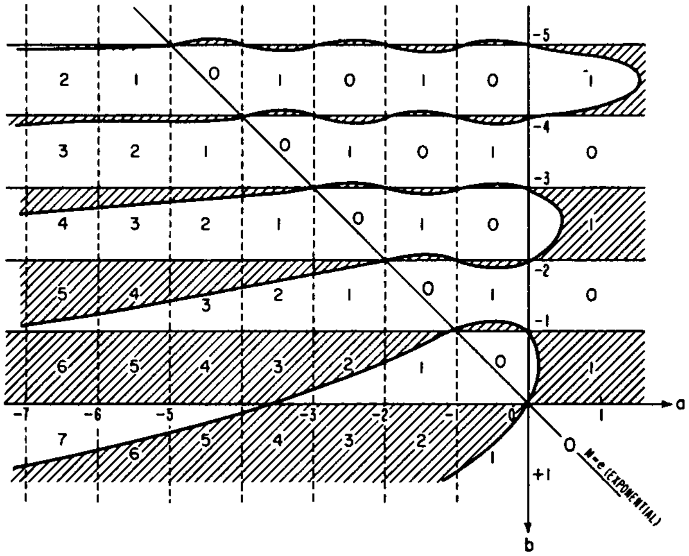

FIGURE 13.1.

**Figure 13.1** shows the curves on which $M(a, b, x)=0$ in the $a$, $b$ plane when $x=1$. The function is positive in the unshaded areas, and negative in the shaded areas. The number in each square gives the number of real positive zeros of $M(a, b, x)$ as a function of $x$ in that square. The vertical boundaries to the left are to be included in each square.

## 13.10. Graphing $M(a, b, x)$

**Example 17.** Sketch $M(-4.5, 1, x)$. Firstly, from **Figure 13.1** we see that the function has five real positive zeros. From **13.5.1,** we find that $M\rightarrow-\infty$, $M'\rightarrow-\infty$ as $x\rightarrow+\infty$ and that $M\rightarrow+\infty$, $M'\rightarrow+\infty$ as $x\rightarrow-\infty$. By **13.7.2** we have as first approximations to the zeros, .3, 1.5, 3.7, 6.9, 10.6, and by **13.7.2** and **13.4.8** we find as first approximations to the turning values .9, 2.8, 5.8, 9.9. From **13.7.7,** we see that these must lie near the curves

$$y=\pm e^{\frac{1}{2}x}(5x)^{-\frac{1}{4}}(1-x/11)^{-\frac{1}{4}}\pi^{-\frac{1}{2}}.$$

From these facts we can form a rough graph of the behavior of the function, **Figure 13.2.**

For $0 \leq x \leq 1$, linear interpolation in $a, b$ or $x$ provides 3–4S. Lagrange four-point interpolation gives 7S in $a, b$ or $x$ over most of the table, but the Lagrange six-point formula is needed over the range $1 \leq x \leq 10$. Any interpolation formula can be reapplied to give two dimensional interpolates in $a$ and $b$, $a$ and $x$ or $b$ and $x$. This calculation can be checked by being repeated in a different order.

# 14. Coulomb Wave Functions

## Mathematical Properties

### 14.1. Differential Equation, Series Expansions

#### Differential Equation

**14.1.1**

$$\frac{d^2w}{d\rho^2}+[1-\frac{2\eta}{\rho}-\frac{L(L+1)}{\rho^2}]w=0$$

($\rho>0$, $-\infty<\eta<\infty$, $L$ a non-negative integer)

The Coulomb wave equation has a regular singularity at $\rho=0$ with indices $L+1$ and $-L$; it has an irregular singularity at $\rho=\infty$.

#### General Solution

**14.1.2**

$$w=C_1F_L(\eta,\ \rho)+C_2G_L(\eta,\ \rho) \qquad (C_1,\ C_2 \text{ constants})$$

where $F_L(\eta, \rho)$ is the regular Coulomb wave function and $G_L(\eta, \rho)$ is the irregular (logarithmic) Coulomb wave function.

#### Regular Coulomb Wave Function $F_L(\eta, \rho)$

**14.1.3**

$$F_L(\eta, \rho)=C_L(\eta)\rho^{L+1}e^{-i\rho}M(L+1-i\eta, 2L+2, 2i\rho)$$

**14.1.4**

$$=C_L(\eta)\rho^{L+1}\Phi_L(\eta, \rho)$$

**14.1.5** $$\Phi_L(\eta, \rho)=\sum_{k=L+1}^{\infty} A_k^L(\eta)\rho^{k-L-1}$$

**14.1.6**

$$A_{L+1}^L=1, \quad A_{L+2}^L=\frac{\eta}{L+1},$$

$$(k+L)(k-L-1)A_k^L=2\eta A_{k-1}^L-A_{k-2}^L \qquad (k>L+2)$$

**14.1.7** $$C_L(\eta)=\frac{2^Le^{-\frac{\pi\eta}{2}}|\Gamma(L+1+i\eta)|}{\Gamma(2L+2)}$$

(See chapter **6.**)

**14.1.8** $$C_0^2(\eta)=2\pi\eta(e^{2\pi\eta}-1)^{-1}$$

**14.1.9** $$C_L^2(\eta)=\frac{p_L(\eta)C_0^2(\eta)}{2\eta(2L+1)}$$

**14.1.10** $$C_L(\eta)=\frac{(L^2+\eta^2)^{\frac{1}{2}}}{L(2L+1)}C_{L-1}(\eta)$$

**14.1.11** $$\frac{p_L(\eta)}{2\eta}=\frac{(1+\eta^2)(4+\eta^2)\ldots(L^2+\eta^2)2^{2L}}{(2L+1)[(2L)!]^2}$$

**14.1.12** $$F_L'=\frac{d}{d\rho}F_L(\eta, \rho)=C_L(\eta)\rho^L\Phi_L^*(\eta, \rho)$$

**14.1.13** $$\Phi_L^*(\eta, \rho)=\sum_{k=L+1}^{\infty} kA_k^L(\eta)\rho^{k-L-1}$$

#### Irregular Coulomb Wave Function $G_L(\eta, \rho)$

**14.1.14**

$$G_L(\eta, \rho)=\frac{2\eta}{C_0^2(\eta)}F_L(\eta, \rho)[\ln 2\rho+\frac{q_L(\eta)}{p_L(\eta)}]+\theta_L(\eta, \rho)$$

**14.1.15** $$\theta_L(\eta, \rho)=D_L(\eta)\rho^{-L}\psi_L(\eta, \rho)$$

**14.1.16** $$D_L(\eta)C_L(\eta)=\frac{1}{2L+1}$$

**14.1.17** $$\psi_L(\eta, \rho)=\sum_{k=-L}^{\infty} a_k^L(\eta)\rho^{k+L}$$

**14.1.18**

$$a_{-L}^L=1, \quad a_{L+1}^L=0,$$

$$(k-L-1)(k+L)a_k^L=2\eta a_{k-1}^L-a_{k-2}^L-(2k-1)\,p_L(\eta)A_k^L$$

**14.1.19**

$$\frac{q_L(\eta)}{p_L(\eta)}=\sum_{s=1}^{L}\frac{s}{s^2+\eta^2}-\sum_{s=1}^{2L+1}\frac{1}{s}$$
$$+\mathscr{R}\{\frac{\Gamma'(1+i\eta)}{\Gamma(1+i\eta)}\}+2\gamma+\frac{r_L(\eta)}{p_L(\eta)}$$

(See **Table 6.8.**)

**14.1.20**

$$r_L(\eta)=\frac{(-1)^{L+1}}{(2L)!}\mathscr{I}\{\frac{1}{2L+1}+\frac{2(i\eta-L)}{2L(1!)}$$
$$+\frac{2^2(i\eta-L)(i\eta-L+1)}{(2L-1)(2!)}+\ldots$$
$$+\frac{2^{2L}(i\eta-L)(i\eta-L+1)\ldots(i\eta+L-1)}{(2L)!}\}$$

**14.1.21**

$$G_L'=\frac{dG_L}{d\rho}=\frac{2\eta}{C_0^2(\eta)}\{F_L'[\ln 2\rho+\frac{q_L(\eta)}{p_L(\eta)}]+\rho^{-1}F_L(\eta, \rho)\}$$
$$+\theta_L'(\eta, \rho)$$

**14.1.22** $$\theta_L'=\frac{d}{d\rho}\theta_L(\eta,\rho)=D_L(\eta)\rho^{-L-1}\psi_L^*(\eta,\rho)$$

**14.1.23** $$\psi_L^*(\eta,\rho)=\sum_{k=-L}^{\infty}ka_k^L(\eta)\rho^{k+L}$$

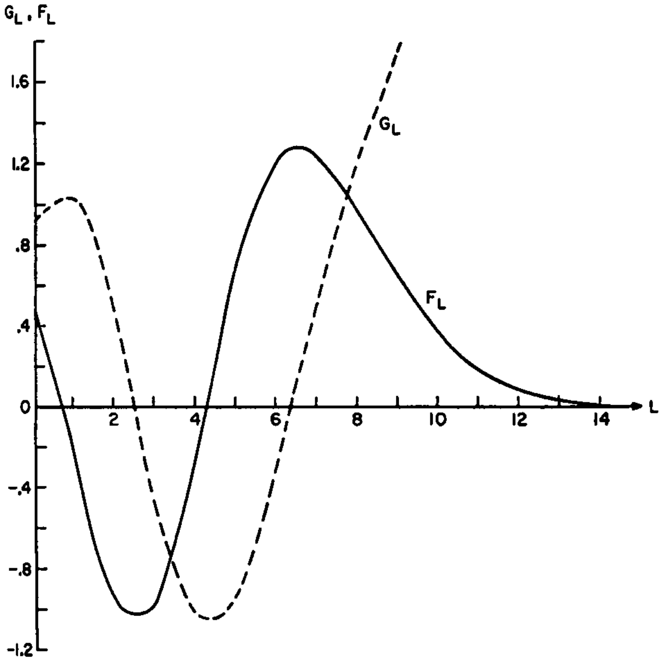

FIGURE 14.1. $F_L(\eta,\rho)$, $G_L(\eta,\rho)$.

$\eta=1$, $\rho=10$

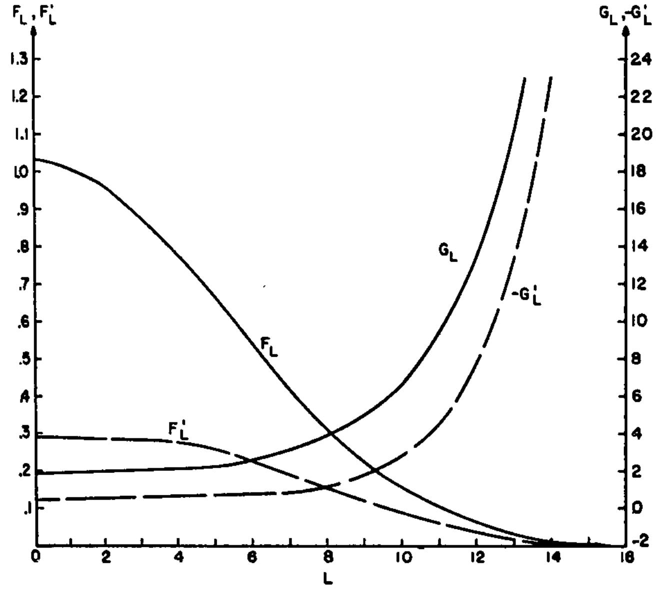

FIGURE 14.2. $F_L$, $F_L'$, $G_L$ and $G_L'$.

$\eta=10$, $\rho=20$

## 14.2. Recurrence and Wronskian Relations

### Recurrence Relations

If $u_L=F_L(\eta,\rho)$ or $G_L(\eta,\rho)$,

**14.2.1** $$L\frac{du_L}{d\rho}=(L^2+\eta^2)^{\frac{1}{2}}u_{L-1}-\left(\frac{L^2}{\rho}+\eta\right)u_L$$

**14.2.2**

$$(L+1)\frac{du_L}{d\rho}=\left[\frac{(L+1)^2}{\rho}+\eta\right]u_L-[(L+1)^2+\eta^2]^{\frac{1}{2}}u_{L+1}$$

**14.2.3**

$$L[(L+1)^2+\eta^2]^{\frac{1}{2}}u_{L+1}=(2L+1)\left[\eta+\frac{L(L+1)}{\rho}\right]u_L$$
$$-(L+1)[L^2+\eta^2]^{\frac{1}{2}}u_{L-1}$$

### Wronskian Relations

**14.2.4** $$F_L'G_L-F_LG_L'=1$$

**14.2.5** $$F_{L-1}G_L-F_LG_{L-1}=L(L^2+\eta^2)^{-\frac{1}{2}}$$

## 14.3. Integral Representations

**14.3.1**

$$F_L+iG_L=\frac{ie^{-i\rho}\rho^{-L}}{(2L+1)!C_L(\eta)}\int_0^{\infty}e^{-t}t^{L-i\eta}(t+2i\rho)^{L+i\eta}dt$$

**14.3.2**

$$F_L-iG_L=$$

$$\frac{e^{-\pi\eta}\rho^{L+1}}{(2L+1)!C_L(\eta)}\int_{-1}^{-i\infty}e^{-i\rho t}(1-t)^{L-i\eta}(1+t)^{L+i\eta}dt$$

**14.3.3**

$$F_L+iG_L=\frac{e^{-\pi\eta}\rho^{L+1}}{(2L+1)!C_L(\eta)}$$

$$\cdot\int_0^{\infty}\{(1-\tanh^2 t)^{L+1}\exp[-i(\rho\tanh t-2\eta t)]$$
$$+i(1+t^2)^L\exp[-\rho t+2\eta\arctan t]\}dt$$

## 14.4. Bessel Function Expansions

### Expansion in Terms of Bessel-Clifford Functions

**14.4.1**

$$F_L(\eta,\rho)=C_L(\eta)\frac{(2L+1)!}{(2\eta)^{2L+1}}\rho^{-L}\sum_{k=2L+1}^{\infty}b_kt^{k/2}I_k(2\sqrt{t})$$

$$(t=2\eta\rho,\ \eta>0)$$

**14.4.2**

$$G_L(\eta,\rho)\sim D_L(\eta)\lambda_L(\eta)\rho^{-L}\sum_{k=2L+1}^{\infty}(-1)^kb_kt^{k/2}K_k(2\sqrt{t})$$

**14.4.3**

$$b_{2L+1}=1, \quad b_{2L+2}=0,$$

$$* \quad 4\eta^2(k-2L)b_{k+1}+kb_{k-1}+b_{k-2}=0 \qquad (k\geq 2L+2)$$

**14.4.4**

$$\lambda_L(\eta)\sum_{k=2L+1}^{\infty}(-1)^k(k-1)!b_k=2$$

(See chapter **9**.)

### Expansion in Terms of Spherical Bessel Functions

**14.4.5**

$$F_L(\eta,\rho)=1\cdot 3\cdot 5\ldots(2L+1)\rho C_L(\eta)\sum_{k=L}^{\infty}b_k\sqrt{\frac{\pi}{2\rho}}J_{k+\frac{1}{2}}(\rho)$$

**14.4.6**

$$b_L=1,\, b_{L+1}=\frac{2L+3}{L+1}\eta$$

$$b_k=\frac{(2k+1)}{k(k+1)-L(L+1)}\left\{2\eta b_{k-1}-\frac{(k-1)(k-2)-L(L+1)}{2k-3}b_{k-2}\right\} \qquad (k>L+1)$$

**14.4.7**

$$F'_L(\eta,\rho)=1\cdot 3\cdot 5\ldots(2L+1)\rho C_L(\eta)\left\{\frac{(L+1)}{(2L+1)}b_L\sqrt{\frac{\pi}{2\rho}}J_{L-\frac{1}{2}}(\rho)+\frac{(L+2)}{(2L+3)}\cdot b_{L+1}\cdot\sqrt{\frac{\pi}{2\rho}}J_{L+\frac{1}{2}}(\rho)+\sum_{k=L+1}^{\infty}b'_k\sqrt{\frac{\pi}{2\rho}}J_{k+\frac{1}{2}}(\rho)\right\}$$

**14.4.8** $$b'_k=\frac{(k+2)}{(2k+3)}b_{k+1}-\frac{(k-1)}{(2k-1)}b_{k-1}$$

### Expansion in Terms of Airy Functions

$$x=(2\eta-\rho)/(2\eta)^{1/3} \qquad \mu=(2\eta)^{2/3},\ \eta>>0$$

$$|\rho-2\eta|<2\eta$$

**14.4.9**

$$\begin{matrix}F_0(\eta,\rho)\\ G_0(\eta,\rho)\end{matrix}=\pi^{\frac{1}{2}}(2\eta)^{\frac{1}{6}}\left\{\begin{matrix}\mathrm{Ai}(x)\\ \mathrm{Bi}(x)\end{matrix}\left[1+\frac{g_1}{\mu}+\frac{g_2}{\mu^2}+\cdots\right]+\begin{matrix}\mathrm{Ai}'(x)\\ \mathrm{Bi}'(x)\end{matrix}\left[\frac{f_1}{\mu}+\frac{f_2}{\mu^2}+\cdots\right]\right\}$$

**14.4.10**

$$\begin{matrix}F'_0(\eta,\rho)\\ G'_0(\eta,\rho)\end{matrix}=-\pi^{\frac{1}{2}}(2\eta)^{-\frac{1}{6}}\left\{\begin{matrix}\mathrm{Ai}(x)\\ \mathrm{Bi}(x)\end{matrix}\left[\frac{g'_1+xf_1}{\mu}+\frac{g'_2+xf_2}{\mu^2}+\cdots\right]+\begin{matrix}\mathrm{Ai}'(x)\\ \mathrm{Bi}'(x)\end{matrix}\left[1+\frac{(g_1+f'_1)}{\mu}+\frac{(g_2+f'_2)}{\mu^2}+\cdots\right]\right\}$$

$$f_1=(1/5)x^2$$

$$f_2=\frac{1}{35}(2x^3+6)$$

$$f_3=\frac{1}{63000}(84x^7+1480x^4+2320x)$$

$$g_1=-(1/5)x$$

$$g_2=\frac{1}{350}(7x^5-30x^2)$$

$$g_3=\frac{1}{63000}(1056x^6-1160x^3-2240)$$

(See chapter **10**.)

## 14.5. Asymptotic Expansions

### Asymptotic Expansion for Large Values of $\rho$

**14.5.1** $$F_L=g\cos\theta_L+f\sin\theta_L$$

**14.5.2** $$G_L=f\cos\theta_L-g\sin\theta_L$$

**14.5.3** $$F'_L=g^*\cos\theta_L+f^*\sin\theta_L$$

**14.5.4** $$G'_L=f^*\cos\theta_L-g^*\sin\theta_L,\ gf^*-fg^*=1$$

**14.5.5** $$\theta_L=\rho-\eta\ln 2\rho-L\frac{\pi}{2}+\sigma_L$$

**14.5.6** $$\sigma_L=\arg\Gamma(L+1+i\eta)$$

(See **6.1.27, 6.1.44.**)

**14.5.7** $$\sigma_{L+1}=\sigma_L+\arctan\frac{\eta}{L+1}$$

(See **Tables 4.14, 6.7.**)

**14.5.8** $$f\sim\sum_{k=0}^{\infty}f_k,\ g\sim\sum_{k=0}^{\infty}g_k,\ f^*\sim\sum_{k=0}^{\infty}f^*_k,\ g^*\sim\sum_{k=0}^{\infty}g^*_k$$

where

$$f_0=1,\ g_0=0,\ f^*_0=0,\ g^*_0=1-\eta/\rho$$

$$f_{k+1}=a_kf_k-b_kg_k$$

$$g_{k+1}=a_kg_k+b_kf_k$$

$$f^*_{k+1}=a_kf^*_k-b_kg^*_k-f_{k+1}/\rho$$

$$g^*_{k+1}=a_kg^*_k+b_kf^*_k-g_{k+1}/\rho$$

$$a_k=\frac{(2k+1)\eta}{(2k+2)\rho},\quad b_k=\frac{L(L+1)-k(k+1)+\eta^2}{(2k+2)\rho}$$

---

*See page II.

**14.5.9**

$$f+ig\sim 1+\frac{(i\eta-L)(i\eta+L+1)}{1!(2i\rho)}+\frac{(i\eta-L)(i\eta-L+1)(i\eta+L+1)(i\eta+L+2)}{2!(2i\rho)^2}$$
$$+\frac{(i\eta-L)(i\eta-L+1)(i\eta-L+2)(i\eta+L+1)(i\eta+L+2)(i\eta+L+3)}{3!(2i\rho)^3}+\ldots$$

**Asymptotic Expansion for $L=0,\ \rho=2\eta>>0$**

**14.5.10**
$$\begin{matrix}F_0(2\eta)\\ G_0(2\eta)/\sqrt{3}\end{matrix}\sim\frac{\Gamma(1/3)\beta^{1/2}}{2\sqrt{\pi}}\left\{1\mp\frac{2}{35}\frac{\Gamma(2/3)}{\Gamma(1/3)}\frac{1}{\beta^4}-\frac{32}{8100}\frac{1}{\beta^6}\mp\frac{92672}{7371\cdot 10^4}\frac{\Gamma(2/3)}{\Gamma(1/3)}\frac{1}{\beta^{10}}-\ldots\right\}$$

**14.5.11**
$$\begin{matrix}F_0'(2\eta)\\ G_0'(2\eta)/\sqrt{3}\end{matrix}\sim\frac{\Gamma(2/3)}{2\sqrt{\pi}\beta^{1/2}}\left\{\pm 1+\frac{1}{15}\frac{\Gamma(1/3)}{\Gamma(2/3)}\frac{1}{\beta^2}\pm\frac{8}{56700}\frac{1}{\beta^6}+\frac{11488}{18711\cdot 10^3}\frac{\Gamma(1/3)}{\Gamma(2/3)}\frac{1}{\beta^8}\pm\ldots\right\}$$

$$\beta=(2\eta/3)^{1/6},\ \Gamma(1/3)=2.6789\ 38534\ldots,\ \Gamma(2/3)=1.3541\ 17939\ldots$$

$$C_0(\eta)\sim(2\pi\eta)^{1/2}e^{-\pi\eta},$$

(Equality to 8S for $\eta>3$.)

**14.6.17** $$\eta\to 0$$

$$\sigma_0(\eta)\sim-\gamma\eta \qquad (\gamma=\text{Euler's constant})$$

$$C_L(\eta)\sim\frac{2^L L!}{(2L+1)!}$$

**14.6.18** $$L\to\infty$$

$$C_L(\eta)\sim\frac{2^L L!}{(2L+1)!}e^{-\pi\eta/2}$$

## Numerical Methods

### 14.7. Use and Extension of the Tables

In general the tables as presented are not simply interpolable. However, values for $L>0$ may be obtained with the help of the recurrence relations. The values of $G_L(\eta,\rho)$ may be obtained by applying the recurrence relations in increasing order of $L$. Forward recurrence may be used for $F_L(\eta,\rho)$ as long as the instability does not produce errors in excess of the accuracy needed. In this case the backwards recurrence scheme (see **Example 1**) should be used.

**Example 1.** Compute $F_L(\eta,\rho)$ and $F_L'(\eta,\rho)$ for $\eta=2$, $\rho=5$, $L=0(1)5$. Starting with $F_{10}^*=1$, $F_{11}^*=0$, where $F_L^*=cF_L$, we compute from **14.2.3** in decreasing order of $L$:

| $L$ | (1) $F_L^*$ | (2) $F_L$ | (3) $F_L$ | (4) $F_L'$ |
|---|---|---|---|---|
| 11 | 0. | | | |
| 10 | 1. | | | |
| 9 | 4.49284 | | | |
| 8 | 17.5225 | | | |
| 7 | 61.3603 | | | |
| 6 | 191.238 | | | |
| 5 | 523.472 | .090791 | .091 | .1043 |
| 4 | 1238.53 | .21481 | .215 | .2030 |
| 3 | 2486.72 | .43130 | .4313 | .3205 |
| 2 | 4158.46 | .72124 | .72125 | .3952 |
| 1 | 5727.97 | .99346 | .99347 | .3709 |
| 0 | 6591.81 | 1.1433 | 1.1433 | .29380 |

$F_0/F_0^*=1.7344\times10^{-4}=c^{-1}$.

The values in the second column are obtained from those in the first by multiplying by the normalization constant, $F_0/F_0^*$ where $F_0$ is the known value obtained from **Table 14.1.**

Repetition starting with $F_{15}^*=1$ and $F_{16}^*=0$ yields the same results.

In column 3, the results have been given when **14.2.3** is used in increasing order of $L$.

$F_L'$ (column 4) follows from **14.2.2.**

**Example 2.** Compute $G_L(\eta,\rho)$ and $G_L'(\eta,\rho)$ for $\eta=2$, $\rho=5$, $L=1(1)5$.

Using **14.2.2** and $G_0(2,5)=.79445$, $G_0'=-.67049$ from **Table 14.1** we find $G_1(2,5)=1.0815$. Then by forward recurrence using **14.2.3** we find:

| $L$ | $G_L$ | $-G'_L$ * |
|---|---|---|
| 1 | 1.0815 | .60286 |
| 2 | 1.4969 | .56619 |
| 3 | 2.0487 | .79597 |
| 4 | 3.0941 | 1.7318 |
| 5 | 5.6298 | 4.5493 |

The values of $G_L'$ are obtained with **14.2.1.**

**Example 3.** Compute $G_0(\eta,\rho)$ for $\eta=2$, $\rho=2.5$.

From **Table 14.1,** $G_0(2,2)=3.5124$, $G_0'(2,2)=-2.5554$. Successive differentiation of **14.1.1** for $L=0$ gives

$$\rho\frac{d^{k+2}w}{d\rho^{k+2}}=(2\eta-\rho)\frac{d^k w}{d\rho^k}-k\left\{\frac{d^{k+1}w}{d\rho^{k+1}}+\frac{d^{k-1}w}{d\rho^{k-1}}\right\}$$

Taylor's expansion is $w(\rho+\Delta\rho)=w(\rho)+(\Delta\rho)w'+\frac{(\Delta\rho)^2}{2!}w''+\ldots$. With $w=G_0(\eta,\rho)$ and $\Delta\rho=.5$ we get:

| $k$ | $\frac{d^kG_0}{d\rho^k}$ | $\frac{(\Delta\rho)^k}{k!}\frac{d^kG_0}{d\rho^k}$ |
|---|---|---|
| 0 | 3.5124 | 3.5124 |
| 1 | −2.5554 | −1.2777 |
| 2 | 3.5124 | .43905 |
| 3 | −6.0678 | −.12641 |
| 4 | 12.136 | .03160 |
| 5 | −29.540 | −.00769 |
| 6 | 83.352 | .00181 |
| 7 | −268.26 | −.00042 |

$$G_0(2,2.5)=2.5726$$

As a check the result is obtained with $\eta=2$, $\rho=3$, $\Delta\rho=-.5$. The derivative $G_0'(\eta,\rho)$ may be obtained using Taylor's formula with $w=G_0'(\eta,\rho)$.

# 15. Hypergeometric Functions

## Mathematical Properties

### 15.1. Gauss Series, Special Elementary Cases, Special Values of the Argument

#### Gauss Series

The circle of convergence of the Gauss hypergeometric series

**15.1.1**

$$F(a,b;c;z)={}_2F_1(a,b;c;z)$$

$$=F(b,a;c;z)=\sum_{n=0}^{\infty}\frac{(a)_n(b)_n}{(c)_n}\frac{z^n}{n!}$$

$$=\frac{\Gamma(c)}{\Gamma(a)\Gamma(b)}\sum_{n=0}^{\infty}\frac{\Gamma(a+n)\Gamma(b+n)}{\Gamma(c+n)}\frac{z^n}{n!}$$

is the unit circle $|z|=1$. The behavior of this series on its circle of convergence is:

(a) Divergence when $\mathscr{R}(c-a-b)\leqq -1$.

(b) Absolute convergence when $\mathscr{R}(c-a-b)>0$.

(c) Conditional convergence when $-1<\mathscr{R}(c-a-b)\leqq 0$; the point $z=1$ is excluded. The Gauss series reduces to a polynomial of degree $n$ in $z$ when $a$ or $b$ is equal to $-n$, $(n=0, 1, 2, \ldots)$. (For these cases see also **15.4.**) The series **15.1.1** is not defined when $c$ is equal to $-m$, $(m=0, 1, 2, \ldots)$, provided $a$ or $b$ is not a negative integer $n$ with $n<m$. For $c=-m$

**15.1.2**

$$\lim_{c\to -m}\frac{1}{\Gamma(c)}F(a,b;c;z)=$$

$$\frac{(a)_{m+1}(b)_{m+1}}{(m+1)!}z^{m+1}F(a+m+1, b+m+1; m+2; z)$$

#### Special Elementary Cases of Gauss Series

(For cases involving higher functions see **15.4.**)

**15.1.3** $F(1,1;2;z)=-z^{-1}\ln(1-z)$ *

**15.1.4** $F(\tfrac{1}{2},1;\tfrac{3}{2};z^2)=\tfrac{1}{2}z^{-1}\ln\left(\dfrac{1+z}{1-z}\right)$

**15.1.5** $F(\tfrac{1}{2},1;\tfrac{3}{2};-z^2)=z^{-1}\arctan z$

**15.1.6**

$$F(\tfrac{1}{2},\tfrac{1}{2};\tfrac{3}{2};z^2)=(1-z^2)^{\frac{1}{2}}F(1,1;\tfrac{3}{2};z^2)=z^{-1}\arcsin z$$

**15.1.7**

$$F(\tfrac{1}{2},\tfrac{1}{2};\tfrac{3}{2};-z^2)=(1+z^2)^{\frac{1}{2}}F(1,1;\tfrac{3}{2};-z^2)$$
$$=z^{-1}\ln[z+(1+z^2)^{\frac{1}{2}}]$$

**15.1.8** $F(a,b;b;z)=(1-z)^{-a}$

**15.1.9** $F(a,\tfrac{1}{2}+a;\tfrac{1}{2};z^2)=\tfrac{1}{2}[(1+z)^{-2a}+(1-z)^{-2a}]$

**15.1.10**

$$F(a,\tfrac{1}{2}+a;\tfrac{3}{2};z^2)=$$
$$\tfrac{1}{2}z^{-1}(1-2a)^{-1}[(1+z)^{1-2a}-(1-z)^{1-2a}]$$

**15.1.11**

$$F(-a,a;\tfrac{1}{2};-z^2)=\tfrac{1}{2}\{[(1+z^2)^{\frac{1}{2}}+z]^{2a}+[(1+z^2)^{\frac{1}{2}}-z]^{2a}\}$$

**15.1.12**

$$F(a,1-a;\tfrac{1}{2};-z^2)=$$
$$\tfrac{1}{2}(1+z^2)^{-\frac{1}{2}}\{[(1+z^2)^{\frac{1}{2}}+z]^{2a-1}+[(1+z^2)^{\frac{1}{2}}-z]^{2a-1}\}$$

**15.1.13**

$$F(a,\tfrac{1}{2}+a;1+2a;z)=2^{2a}[1+(1-z)^{\frac{1}{2}}]^{-2a}$$
$$=(1-z)^{\frac{1}{2}}F(1+a,\tfrac{1}{2}+a;1+2a;z)$$

**15.1.14**

$$F(a,\tfrac{1}{2}+a;2a;z)=2^{2a-1}(1-z)^{-\frac{1}{2}}[1+(1-z)^{\frac{1}{2}}]^{1-2a}$$

**15.1.15** $F(a,1-a;\tfrac{3}{2};\sin^2 z)=\dfrac{\sin[(2a-1)z]}{(2a-1)\sin z}$

**15.1.16** $F(a,2-a;\tfrac{3}{2};\sin^2 z)=\dfrac{\sin[(2a-2)z]}{(a-1)\sin(2z)}$

**15.1.17** $F(-a,a;\tfrac{1}{2};\sin^2 z)=\cos(2az)$

**15.1.18** $F(a,1-a;\tfrac{1}{2};\sin^2 z)=\dfrac{\cos[(2a-1)z]}{\cos z}$

**15.1.19** $F(a,\tfrac{1}{2}+a;\tfrac{1}{2};-\tan^2 z)=\cos^{2a}z\cos(2az)$

#### Special Values of the Argument

**15.1.20**

$$F(a,b;c;1)=\frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}$$

$$(c\neq 0, -1, -2, \ldots, \mathscr{R}(c-a-b)>0)$$

---

*See page II.

**15.1.21**

$$F(a, b; a-b+1; -1)=2^{-a}\pi^{\frac{1}{2}}\frac{\Gamma(1+a-b)}{\Gamma(1+\frac{1}{2}a-b)\Gamma(\frac{1}{2}+\frac{1}{2}a)}$$

$$(1+a-b\neq 0, -1, -2, \ldots)$$

**15.1.22**

$$F(a, b; a-b+2; -1)=2^{-a}\pi^{1/2}(b-1)^{-1}\Gamma(a-b+2)$$

$$\left[\frac{1}{\Gamma(\frac{1}{2}a)\Gamma(\frac{3}{2}+\frac{1}{2}a-b)}-\frac{1}{\Gamma(\frac{1}{2}+\frac{1}{2}a)\Gamma(1+\frac{1}{2}a-b)}\right]$$

$$(a-b+2\neq 0, -1, -2, \ldots)$$

**15.1.23** $F(1, a; a+1; -1)=\frac{1}{2}a[\psi(\frac{1}{2}+\frac{1}{2}a)-\psi(\frac{1}{2}a)]$

**15.1.24**

$$F(a, b; \tfrac{1}{2}a+\tfrac{1}{2}b+\tfrac{1}{2}; \tfrac{1}{2})=\pi^{\frac{1}{2}}\frac{\Gamma(\frac{1}{2}+\frac{1}{2}a+\frac{1}{2}b)}{\Gamma(\frac{1}{2}+\frac{1}{2}a)\Gamma(\frac{1}{2}+\frac{1}{2}b)}$$

$$(\tfrac{1}{2}a+\tfrac{1}{2}b+\tfrac{1}{2}\neq 0, -1, -2, \ldots)$$

**15.1.25**

$$F(a, b; \tfrac{1}{2}a+\tfrac{1}{2}b+1; \tfrac{1}{2})=2\pi^{\frac{1}{2}}(a-b)^{-1}\Gamma(1+\tfrac{1}{2}a+\tfrac{1}{2}b)$$

$$\{[\Gamma(\tfrac{1}{2}a)\Gamma(\tfrac{1}{2}+\tfrac{1}{2}b)]^{-1}-[\Gamma(\tfrac{1}{2}+\tfrac{1}{2}a)\Gamma(\tfrac{1}{2}b)]^{-1}\}$$

$$(\tfrac{1}{2}(a+b)+1\neq 0, -1, -2, \ldots)$$

**15.1.26**

$$F(a, 1-a; b; \tfrac{1}{2})=$$

$$2^{1-b}\pi^{\frac{1}{2}}\Gamma(b)\,[\Gamma(\tfrac{1}{2}a+\tfrac{1}{2}b)\,\Gamma\,(\tfrac{1}{2}+\tfrac{1}{2}b-\tfrac{1}{2}a)]^{-1}$$

$$(b\neq 0, -1, -2, \ldots)$$

**15.1.27**

$$F(1, 1; a+1; \tfrac{1}{2})=a[\psi(\tfrac{1}{2}+\tfrac{1}{2}a)-\psi(\tfrac{1}{2}a)]$$

$$(a\neq -1, -2, -3, \ldots)$$

**15.1.28**

$$F(a, a; a+1; \tfrac{1}{2})=2^{a-1}a[\psi(\tfrac{1}{2}+\tfrac{1}{2}a)-\psi(\tfrac{1}{2}a)]$$

$$(a\neq -1, -2, -3, \ldots)$$

**15.1.29**

$$F\,(a, \tfrac{1}{2}+a; \tfrac{3}{2}-2a; -\tfrac{1}{3})=(\tfrac{8}{9})^{-2a}\frac{\Gamma(\frac{4}{3})\Gamma(\frac{3}{2}-2a)}{\Gamma(\frac{3}{2})\Gamma(\frac{4}{3}-2a)}$$

$$(\tfrac{3}{2}-2a\neq 0, -1, -2, \ldots)$$

**15.1.30**

$$F\,(a, \tfrac{1}{2}+a; \tfrac{5}{6}+a; \tfrac{1}{9})=(\tfrac{3}{4})^{a}\pi^{\frac{1}{2}}\frac{\Gamma(\frac{5}{6}+\frac{2}{3}a)}{\Gamma(\frac{1}{2}+\frac{1}{3}a)\Gamma(\frac{5}{6}+\frac{1}{3}a)}$$

$$(\tfrac{5}{6}+\tfrac{2}{3}a\neq 0, -1, -2, \ldots)$$

**15.1.31**

$$F\,(a, \tfrac{1}{3}a+\tfrac{1}{3}; \tfrac{2}{3}a+\tfrac{2}{3}; e^{i\pi/3})$$

$$=2^{\frac{2}{3}a+\frac{2}{3}}\pi^{\frac{1}{2}}3^{-\frac{1}{2}(a+1)}e^{i\pi a/6}\frac{\Gamma(\frac{1}{3}a+\frac{5}{6})}{\Gamma(\frac{1}{3}a+\frac{2}{3})\Gamma(\frac{2}{3})}$$

$$(\tfrac{1}{3}\,a\neq -\tfrac{5}{6}, -\tfrac{11}{6}, -\tfrac{17}{6}, \ldots)$$

## 15.2. Differentiation Formulas and Gauss' Relations for Contiguous Functions

### Differentiation Formulas

**15.2.1** $\frac{d}{dz}F(a, b; c; z)=\frac{ab}{c}F(a+1, b+1; c+1; z)$

**15.2.2**

$$\frac{d^n}{dz^n}F(a, b; c; z)=\frac{(a)_n(b)_n}{(c)_n}F(a+n, b+n; c+n; z)$$

**15.2.3**

$$\frac{d^n}{dz^n}[z^{a+n-1}F(a, b; c; z)]=(a)_n z^{a-1}F(a+n, b; c; z)$$

**15.2.4**

$$\frac{d^n}{dz^n}[z^{c-1}F(a, b; c; z)]=(c-n)_n z^{c-n-1}F(a, b; c-n; z)$$

**15.2.5**

$$\frac{d^n}{dz^n}[z^{c-a+n-1}(1-z)^{a+b-c}F(a, b; c; z)]$$

$$=(c-a)_n z^{c-a-1}(1-z)^{a+b-c-n}F(a-n, b; c; z)$$

**15.2.6**

$$\frac{d^n}{dz^n}[(1-z)^{a+b-c}F(a, b; c; z)]$$

$$=\frac{(c-a)_n(c-b)_n}{(c)_n}(1-z)^{a+b-c-n}F(a, b; c+n; z)$$

**15.2.7**

$$\frac{d^n}{dz^n}[(1-z)^{a+n-1}F(a, b; c; z)]$$

$$=\frac{(-1)^n(a)_n(c-b)_n}{(c)_n}(1-z)^{a-1}F(a+n, b; c+n; z)$$

**15.2.8**

$$\frac{d^n}{dz^n}[z^{c-1}(1-z)^{b-c+n}F(a, b; c; z)]$$

$$=(c-n)_n z^{c-n-1}(1-z)^{b-c}F(a-n, b; c-n; z)$$

**15.2.9**

$$\frac{d^n}{dz^n}[z^{c-1}(1-z)^{a+b-c}F(a, b; c; z)]$$

$$=(c-n)_n z^{c-n-1}(1-z)^{a+b-c-n}F(a-n, b-n; c-n; z)$$

### Gauss' Relations for Contiguous Functions

The six functions $F(a\pm 1, b; c; z)$, $F(a, b\pm 1; c; z)$, $F(a, b; c\pm 1; z)$ are called contiguous to $F(a, b; c; z)$. Relations between $F(a, b; c; z)$ and any two contiguous functions have been given by Gauss. By repeated application of these relations the function $F(a+m, b+n; c+l; z)$ with integral $m$, $n$, $l (c+l\neq 0, -1, -2, \ldots)$ can be expressed as a linear combination of $F(a, b; c; z)$ and one of its contiguous functions with coefficients which are rational functions of $a$, $b$, $c$, $z$.

**15.2.10**

$$(c-a)F(a-1, b; c; z)+(2a-c-az+bz)F(a, b; c; z) \\ +a(z-1)F(a+1, b; c; z)=0$$

**15.2.11**

$$(c-b)F(a, b-1; c; z)+(2b-c-bz+az)F(a, b; c; z) \\ +b(z-1)F(a, b+1; c; z)=0$$

**15.2.12**

$$c(c-1)(z-1)F(a, b; c-1; z) \\ +c[c-1-(2c-a-b-1)z]F(a, b; c; z) \\ +(c-a)(c-b)zF(a, b; c+1; z)=0$$

**15.2.13**

$$[c-2a-(b-a)z]F(a, b; c; z) \\ +a(1-z)F(a+1, b; c; z) \\ -(c-a)F(a-1, b; c; z)=0$$

**15.2.14**

$$(b-a)F(a, b; c; z)+aF(a+1, b; c; z) \\ -bF(a, b+1; c; z)=0$$

**15.2.15**

$$(c-a-b)F(a, b; c; z)+a(1-z)F(a+1, b; c; z) \\ -(c-b)F(a, b-1; c; z)=0$$

**15.2.16**

$$c[a-(c-b)z]F(a, b; c; z)-ac(1-z)F(a+1, b; c; z) \\ +(c-a)(c-b)zF(a, b; c+1; z)=0$$

**15.2.17**

$$(c-a-1)F(a, b; c; z)+aF(a+1, b; c; z) \\ -(c-1)F(a, b; c-1; z)=0$$

**15.2.18**

$$(c-a-b)F(a, b; c; z)-(c-a)F(a-1, b; c; z) \\ +b(1-z)F(a, b+1; c; z)=0$$

**15.2.19**

$$(b-a)(1-z)F(a, b; c; z)-(c-a)F(a-1, b; c; z) \\ +(c-b)F(a, b-1; c; z)=0$$

**15.2.20**

$$c(1-z)F(a, b; c; z)-cF(a-1, b; c; z) \\ +(c-b)zF(a, b; c+1; z)=0$$

**15.2.21**

$$[a-1-(c-b-1)z]F(a, b; c; z) \\ +(c-a)F(a-1, b; c; z) \\ -(c-1)(1-z)F(a, b; c-1; z)=0$$

**15.2.22**

$$[c-2b+(b-a)z]F(a, b; c; z) \\ +b(1-z)F(a, b+1; c; z) \\ -(c-b)F(a, b-1; c; z)=0$$

**15.2.23**

$$c[b-(c-a)z]F(a, b; c; z)-bc(1-z)F(a, b+1; c; z) \\ +(c-a)(c-b)zF(a, b; c+1; z)=0$$

**15.2.24**

$$(c-b-1)F(a, b; c; z)+bF(a, b+1; c; z) \\ -(c-1)F(a, b; c-1; z)=0$$

**15.2.25**

$$c(1-z)F(a, b; c; z)-cF(a, b-1; c; z) \\ {}^{*}\quad +(c-a)zF(a, b; c+1; z)=0$$

**15.2.26**

$$[b-1-(c-a-1)z]F(a, b; c; z) \\ +(c-b)F(a, b-1; c; z) \\ -(c-1)(1-z)F(a, b; c-1; z)=0$$

**15.2.27**

$$c[c-1-(2c-a-b-1)z]F(a, b; c; z) \\ +(c-a)(c-b)zF(a, b; c+1; z) \\ -c(c-1)(1-z)F(a, b; c-1; z)=0$$

## 15.3. Integral Representations and Transformation Formulas

### Integral Representations

**15.3.1**

$$F(a, b; c; z)= \\ \frac{\Gamma(c)}{\Gamma(b)\Gamma(c-b)}\int_0^1 t^{b-1}(1-t)^{c-b-1}(1-tz)^{-a}dt \\ (\mathscr{R}c>\mathscr{R}b>0)$$

The integral represents a one valued analytic function in the $z$-plane cut along the real axis from 1 to $\infty$ and hence **15.3.1** gives the analytic continuation of **15.1.1**, $F(a, b; c; z)$. Another integral representation is in the form of a Mellin-Barnes integral

---

*See page II.

**15.3.2** $$F(a, b; c; z)=\frac{\Gamma(c)}{2\pi i\Gamma(a)\Gamma(b)}\int_{-i\infty}^{i\infty}\frac{\Gamma(a+s)\Gamma(b+s)\Gamma(-s)}{\Gamma(c+s)}(-z)^s ds$$
$$=\tfrac{1}{2}i\,\frac{\Gamma(c)}{\Gamma(a)\Gamma(b)}\int_{-i\infty}^{i\infty}\frac{\Gamma(a+s)\Gamma(b+s)}{\Gamma(1+s)\Gamma(c+s)}\csc(\pi s)(-z)^s ds$$

Here $-\pi<\arg(-z)<\pi$ and the path of integration is chosen such that the poles of $\Gamma(a+s)$ and $\Gamma(b+s)$ i.e. the points $s=-a-n$ and $s=-b-m(n,\ m=0,\ 1,\ 2,\ \ldots)$ respectively, are at its left side and the poles of $\csc(\pi s)$ or $\Gamma(-s)$ i.e. $s=0, 1, 2$, are at its right side. The cases in which $-a$, $-b$ or $-c$ are non-negative integers or $a-b$ equal to an integer are excluded.

### Linear Transformation Formulas

From **15.3.1** and **15.3.2** a number of transformation formulas for $F(a, b; c; z)$ can be derived.

**15.3.3** $$F(a, b; c; z)=(1-z)^{c-a-b}F(c-a, c-b; c; z)$$

**15.3.4** $$=(1-z)^{-a}F\left(a, c-b; c; \frac{z}{z-1}\right)$$

**15.3.5** $$=(1-z)^{-b}F\left(b, c-a; c; \frac{z}{z-1}\right)$$

**15.3.6** $$=\frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}F(a, b; a+b-c+1; 1-z)$$
$$+(1-z)^{c-a-b}\frac{\Gamma(c)\Gamma(a+b-c)}{\Gamma(a)\Gamma(b)}F(c-a, c-b; c-a-b+1; 1-z)$$
$$(|\arg(1-z)|<\pi)$$

**15.3.7** $$=\frac{\Gamma(c)\Gamma(b-a)}{\Gamma(b)\Gamma(c-a)}(-z)^{-a}F\left(a, 1-c+a; 1-b+a; \frac{1}{z}\right)$$
$$+\frac{\Gamma(c)\Gamma(a-b)}{\Gamma(a)\Gamma(c-b)}(-z)^{-b}F\left(b, 1-c+b; 1-a+b; \frac{1}{z}\right)\qquad(|\arg(-z)|<\pi)$$

**15.3.8** $$=(1-z)^{-a}\frac{\Gamma(c)\Gamma(b-a)}{\Gamma(b)\Gamma(c-a)}F\left(a, c-b; a-b+1; \frac{1}{1-z}\right)$$
$$+(1-z)^{-b}\frac{\Gamma(c)\Gamma(a-b)}{\Gamma(a)\Gamma(c-b)}F\left(b, c-a; b-a+1; \frac{1}{1-z}\right)\qquad(|\arg(1-z)|<\pi)$$

**15.3.9** $$=\frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}z^{-a}F\left(a, a-c+1; a+b-c+1; 1-\frac{1}{z}\right)$$
$$+\frac{\Gamma(c)\Gamma(a+b-c)}{\Gamma(a)\Gamma(b)}(1-z)^{c-a-b}z^{a-c}F\left(c-a, 1-a; c-a-b+1; 1-\frac{1}{z}\right)$$
$$(|\arg z|<\pi,\ |\arg(1-z)|<\pi)$$

Each term of **15.3.6** has a pole when $c=a+b\pm m$, $(m=0, 1, 2, \ldots)$; this case is covered by

**15.3.10** $$F(a, b; a+b; z)=\frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)}\sum_{n=0}^{\infty}\frac{(a)_n(b)_n}{(n!)^2}[2\psi(n+1)-\psi(a+n)-\psi(b+n)-\ln(1-z)](1-z)^n$$
$$(|\arg(1-z)|<\pi,\ |1-z|<1)$$

Furthermore for $m=1, 2, 3, \ldots$

**15.3.11** $$F(a, b; a+b+m; z)=\frac{\Gamma(m)\Gamma(a+b+m)}{\Gamma(a+m)\Gamma(b+m)}\sum_{n=0}^{m-1}\frac{(a)_n(b)_n}{n!(1-m)_n}(1-z)^n$$
$$-\frac{\Gamma(a+b+m)}{\Gamma(a)\Gamma(b)}(z-1)^m\sum_{n=0}^{\infty}\frac{(a+m)_n(b+m)_n}{n!(n+m)!}(1-z)^n[\ln(1-z)-\psi(n+1)$$
$$-\psi(n+m+1)+\psi(a+n+m)+\psi(b+n+m)]\qquad(|\arg(1-z)|<\pi, |1-z|<1)$$

**15.3.12**
$$F(a,b;a+b-m;z)=\frac{\Gamma(m)\Gamma(a+b-m)}{\Gamma(a)\Gamma(b)}(1-z)^{-m}\sum_{n=0}^{m-1}\frac{(a-m)_n(b-m)_n}{n!(1-m)_n}(1-z)^n$$
$$-\frac{(-1)^m\Gamma(a+b-m)}{\Gamma(a-m)\Gamma(b-m)}\sum_{n=0}^{\infty}\frac{(a)_n(b)_n}{n!(n+m)!}(1-z)^n[\ln(1-z)-\psi(n+1)$$
$$-\psi(n+m+1)+\psi(a+n)+\psi(b+n)]$$
$$(|\arg(1-z)|<\pi, |1-z|<1)$$

Similarly each term of **15.3.7** has a pole when $b=a\pm m$ or $b-a=\pm m$ and the case is covered by

**15.3.13**
$$F(a,a;c;z)=\frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)}(-z)^{-a}\sum_{n=0}^{\infty}\frac{(a)_n(1-c+a)_n}{(n!)^2}z^{-n}[\ln(-z)+2\psi(n+1)-\psi(a+n)-\psi(c-a-n)]$$
$$(|\arg(-z)|<\pi, |z|>1, (c-a)\neq 0, \pm 1, \pm 2, \ldots)$$

The case $b-a=m$, $(m=1, 2, 3, \ldots)$ is covered by

**15.3.14**
$$F(a,a+m;c;z)=F(a+m,a;c;z)$$
$$=\frac{\Gamma(c)(-z)^{-a-m}}{\Gamma(a+m)\Gamma(c-a)}\sum_{n=0}^{\infty}\frac{(a)_{n+m}(1-c+a)_{n+m}}{n!(n+m)!}z^{-n}[\ln(-z)+\psi(1+m+n)+\psi(1+n)$$
$$-\psi(a+m+n)-\psi(c-a-m-n)]+(-z)^{-a}\frac{\Gamma(c)}{\Gamma(a+m)}\sum_{n=0}^{m-1}\frac{\Gamma(m-n)(a)_n}{n!\Gamma(c-a-n)}z^{-n}$$
$$(|\arg(-z)|<\pi, |z|>1, (c-a)\neq 0, \pm 1, \pm 2, \ldots)$$

The case $c-a=0, -1, -2, \ldots$ becomes elementary, **15.3.3**, and the case $c-a=1, 2, 3, \ldots$ can be obtained from **15.3.14**, by a limiting process (see [15.2]).

### Quadratic Transformation Formulas

If, and only if the numbers $\pm(1-c)$, $\pm(a-b)$, $\pm(a+b-c)$ are such, that two of them are equal or one of them is equal to $\frac{1}{2}$, then there exists a quadratic transformation. The basic formulas are due to Kummer [15.7] and a complete list is due to Goursat [15.3]. See also [15.2].

**15.3.15**
$$F(a,b;2b;z)=(1-z)^{-\frac{1}{2}a}F\left(\tfrac{1}{2}a, b-\tfrac{1}{2}a; b+\tfrac{1}{2}; \frac{z^2}{4z-4}\right)$$

**15.3.16**
$$=(1-\tfrac{1}{2}z)^{-a}F(\tfrac{1}{2}a, \tfrac{1}{2}+\tfrac{1}{2}a; b+\tfrac{1}{2}; z^2(2-z)^{-2})$$

**15.3.17**
$$=(\tfrac{1}{2}+\tfrac{1}{2}\sqrt{1-z})^{-2a}F\left[a, a-b+\tfrac{1}{2}; b+\tfrac{1}{2}; \left(\frac{1-\sqrt{1-z}}{1+\sqrt{1-z}}\right)^2\right]$$

**15.3.18**
$$=(1-z)^{-\frac{1}{2}a}F\left(a, 2b-a; b+\tfrac{1}{2}; -\frac{(1-\sqrt{1-z})^2}{4\sqrt{1-z}}\right)$$

**15.3.19**
$$F(a,a+\tfrac{1}{2};c;z)=(\tfrac{1}{2}+\tfrac{1}{2}\sqrt{1-z})^{-2a}F\left(2a, 2a-c+1; c; \frac{1-\sqrt{1-z}}{1+\sqrt{1-z}}\right)$$

**15.3.20**
$$=(1\pm\sqrt{z})^{-2a}F\left(2a, c-\tfrac{1}{2}; 2c-1; \pm\frac{2\sqrt{z}}{1\pm\sqrt{z}}\right)$$

**15.3.21**
$$=(1-z)^{-a}F\left(2a, 2c-2a-1; c; \frac{\sqrt{1-z}-1}{2\sqrt{1-z}}\right)$$

**15.3.22**
$$F(a,b;a+b+\tfrac{1}{2};z)=F(2a, 2b; a+b+\tfrac{1}{2}; \tfrac{1}{2}-\tfrac{1}{2}\sqrt{1-z})$$

**15.3.23**
$$=(\tfrac{1}{2}+\tfrac{1}{2}\sqrt{1-z})^{-2a}F\left(2a, a-b+\tfrac{1}{2}; a+b+\tfrac{1}{2}; \frac{\sqrt{1-z}-1}{\sqrt{1-z}+1}\right)$$

15.3.24 $F(a, b; a+b-\tfrac{1}{2}; z)=(1-z)^{-\frac{1}{2}}F(2a-1, 2b-1; a+b-\tfrac{1}{2}; \tfrac{1}{2}-\tfrac{1}{2}\sqrt{1-z})$

15.3.25 $=(1-z)^{-\frac{1}{2}}\left(\tfrac{1}{2}+\tfrac{1}{2}\sqrt{1-z}\right)^{1-2a}F\left(2a-1, a-b+\tfrac{1}{2}; a+b-\tfrac{1}{2}; \frac{\sqrt{1-z}-1}{\sqrt{1-z}+1}\right)$

15.3.26 $F(a, b; a-b+1; z)=(1+z)^{-a}F\left(\tfrac{1}{2}a, \tfrac{1}{2}a+\tfrac{1}{2}; a-b+1; 4z(1+z)^{-2}\right)$

15.3.27 $=(1\pm\sqrt{z})^{-2a}F\left(a, a-b+\tfrac{1}{2}; 2a-2b+1; \pm 4\sqrt{z}(1\pm\sqrt{z})^{-2}\right)$

15.3.28 $=(1-z)^{-a}F\left(\tfrac{1}{2}a, \tfrac{1}{2}a-b+\tfrac{1}{2}; a-b+1; -4z(1-z)^{-2}\right)$

15.3.29 $F(a, b; \tfrac{1}{2}a+\tfrac{1}{2}b+\tfrac{1}{2}; z)=(1-2z)^{-a}F\left(\tfrac{1}{2}a, \tfrac{1}{2}a+\tfrac{1}{2}; \tfrac{1}{2}a+\tfrac{1}{2}b+\tfrac{1}{2}; \frac{4z^2-4z}{(1-2z)^2}\right)$

15.3.30 $=F\left(\tfrac{1}{2}a, \tfrac{1}{2}b; \tfrac{1}{2}a+\tfrac{1}{2}b+\tfrac{1}{2}; 4z-4z^2\right)$

15.3.31 $F(a, 1-a; c; z)=(1-z)^{c-1}F\left(\tfrac{1}{2}c-\tfrac{1}{2}a, \tfrac{1}{2}c+\tfrac{1}{2}a-\tfrac{1}{2}; c; 4z-4z^2\right)$

15.3.32 $=(1-z)^{c-1}(1-2z)^{a-c}F\left(\tfrac{1}{2}c-\tfrac{1}{2}a, \tfrac{1}{2}c-\tfrac{1}{2}a+\tfrac{1}{2}; c; (4z^2-4z)(1-2z)^{-2}\right)$

Cubic transformations are listed in [15.2] and [15.3].

In the formulas above, the square roots are defined so that their value is real and positive when $0\leq z<1$. All formulas are valid in the neighborhood of $z=0$.

## 15.4. Special Cases of $F(a, b; c; z)$

### Polynomials

When $a$ or $b$ is equal to a negative integer, then

15.4.1 $F(-m, b; c; z)=\sum_{n=0}^{m}\frac{(-m)_n(b)_n}{(c)_n}\frac{z^n}{n!}$

This formula is also valid when $c=-m-l$; $m, l=0, 1, 2, \ldots$

15.4.2 $F(-m, b; -m-l; z)=\sum_{n=0}^{m}\frac{(-m)_n(b)_n}{(-m-l)_n}\frac{z^n}{n!}$

Some particular cases are

15.4.3 $F(-n, n; \tfrac{1}{2}; x)=T_n(1-2x)$

15.4.4 $F(-n, n+1; 1; x)=P_n(1-2x)$

15.4.5 $F\left(-n, n+2\alpha; \alpha+\frac{1}{2}; x\right)=\frac{n!}{(2\alpha)_n}C_n^{(\alpha)}(1-2x)$

15.4.6 $F(-n, \alpha+1+\beta+n; \alpha+1; x)=\frac{n!}{(\alpha+1)_n}P_n^{(\alpha,\beta)}(1-2x)$

Here $T_n$, $P_n$, $C_n^{(\alpha)}$, $P_n^{(\alpha,\beta)}$ denote Chebyshev, Legendre's, Gegenbauer's and Jacobi's polynomials respectively (see chapter 22).

### Legendre Functions

Legendre functions are connected with those special cases of the hypergeometric function for which a quadratic transformation exists (see **15.3**).

15.4.7 $F(a, b; 2b; z)=2^{2b-1}\Gamma(\tfrac{1}{2}+b)z^{\frac{1}{2}-b}(1-z)^{\frac{1}{2}(b-a-\frac{1}{2})}P_{a-b-\frac{1}{2}}^{\frac{1}{2}-b}\left[\left(1-\frac{z}{2}\right)(1-z)^{-\frac{1}{2}}\right]$

15.4.8 $=2^{2b}\pi^{-\frac{1}{2}}\frac{\Gamma(\frac{1}{2}+b)}{\Gamma(2b-a)}z^{-b}(1-z)^{\frac{1}{2}(b-a)}e^{i\pi(a-b)}Q_{b-1}^{b-a}\left(\frac{2}{z}-1\right)^*$

15.4.9 $F(a, b; 2b; -z)=2^{2b}\pi^{-\frac{1}{2}}\frac{\Gamma(\frac{1}{2}+b)}{\Gamma(a)}z^{-b}(1+z)^{\frac{1}{2}(b-a)}e^{-i\pi(a-b)}Q_{b-1}^{a-b}\left(1+\frac{2}{z}\right)$ $(|\arg z|<\pi, |\arg(1\pm z)|<\pi)^*$

---

*See page II.

**15.4.10** $F(a, a+\tfrac{1}{2}; c; z)=2^{c-1}\Gamma(c)z^{\frac{1}{2}-\frac{1}{2}c}(1-z)^{\frac{1}{2}c-a-\frac{1}{2}}P^{1-c}_{2a-c}[(1-z)^{-\frac{1}{2}}]$

$(|\arg z|<\pi,\ |\arg(1-z)|<\pi,\ z$ not between $0$ and $-\infty)$

**15.4.11** $F(a, a+\tfrac{1}{2}; c; x)=2^{c-1}\Gamma(c)(-x)^{\frac{1}{2}-\frac{1}{2}c}(1-x)^{\frac{1}{2}c-a-\frac{1}{2}}P^{1-c}_{2a-c}[(1-x)^{-\frac{1}{2}}]$ $\quad(-\infty<x<0)$

## 15.5. The Hypergeometric Differential Equation

The hypergeometric differential equation

**15.5.1** $$z(1-z)\frac{d^2w}{dz^2}+[c-(a+b+1)z]\frac{dw}{dz}-abw=0$$

---

*See page II.

has three (regular) singular points $z=0, 1, \infty$. The pairs of exponents at these points are

**15.5.2** $\rho_{1,2}^{(0)}=0, 1-c, \qquad \rho_{1,2}^{(1)}=0, c-a-b, \qquad \rho_{1,2}^{(\infty)}=a, b$

respectively. The general theory of differential equations of the Fuchsian type distinguishes between the following cases.

A. *None of the numbers $c$, $c-a-b$; $a-b$ is equal to an integer.* Then two linearly independent solutions of **15.5.1** in the neighborhood of the singular points 0, 1, $\infty$ are respectively

**15.5.3** $w_{1(0)}=F(a, b; c; z)=(1-z)^{c-a-b}F(c-a, c-b; c; z)$

**15.5.4** $w_{2(0)}=z^{1-c}F(a-c+1, b-c+1; 2-c; z)=z^{1-c}(1-z)^{c-a-b}F(1-a, 1-b; 2-c; z)$

**15.5.5** $w_{1(1)}=F(a, b; a+b+1-c; 1-z)=z^{1-c}F(1+b-c, 1+a-c; a+b+1-c; 1-z)$

**15.5.6** $w_{2(1)}=(1-z)^{c-a-b}F(c-b, c-a; c-a-b+1; 1-z)=z^{1-c}(1-z)^{c-a-b}F(1-a, 1-b; c-a-b+1; 1-z)$

**15.5.7** $w_{1(\infty)}=z^{-a}F(a, a-c+1; a-b+1; z^{-1})=z^{b-c}(z-1)^{c-a-b}F(1-b, c-b; a-b+1; z^{-1})$

**15.5.8** $w_{2(\infty)}=z^{-b}F(b, b-c+1; b-a+1; z^{-1})=z^{a-c}(z-1)^{c-a-b}F(1-a, c-a; b-a+1; z^{-1})$

The second set of the above expressions is obtained by applying **15.3.3** to the first set.

Another set of representations is obtained by applying **15.3.4** to **15.5.3** through **15.5.8.** This gives **15.5.9–15.5.14.**

**15.5.9** $w_{1(0)}=(1-z)^{-a}F\left(a, c-b; c; \frac{z}{z-1}\right)=(1-z)^{-b}F\left(b, c-a; c; \frac{z}{z-1}\right)$

**15.5.10** $w_{2(0)}=z^{1-c}(1-z)^{c-a-1}F\left(a-c+1, 1-b; 2-c; \frac{z}{z-1}\right)=z^{1-c}(1-z)^{c-b-1}F\left(b-c+1, 1-a; 2-c; \frac{z}{z-1}\right)$

**15.5.11** $w_{1(1)}=z^{-a}F(a, a-c+1; a+b-c+1; 1-z^{-1})=z^{-b}F(b, b-c+1; a+b-c+1; 1-z^{-1})$

**15.5.12**

$w_{2(1)}=z^{a-c}(1-z)^{c-a-b}F(c-a, 1-a; c-a-b+1; 1-z^{-1})=z^{b-c}(1-z)^{c-a-b}F(c-b, 1-b; c-a-b+1; 1-z^{-1})$

**15.5.13** $w_{1(\infty)}=(z-1)^{-a}F\left(a, c-b; a-b+1; \frac{1}{1-z}\right)=(z-1)^{-b}F\left(b, c-a; b-a+1; \frac{1}{1-z}\right)$

**15.5.14**

$w_{2(\infty)}=z^{1-c}(z-1)^{c-a-1}F\left(a-c+1, 1-b; a-b+1; \frac{1}{1-z}\right)=z^{1-c}(z-1)^{c-b-1}F\left(b-c+1, 1-a; b-a+1; \frac{1}{1-z}\right)$

**15.5.3** to **15.5.14** constitute Kummer's 24 solutions of the hypergeometric equation. The analytic continuation of $w_{1,2(0)}(z)$ can then be obtained by means of **15.3.3** to **15.3.9.**

B. *One of the numbers $a$, $b$, $c-a$, $c-b$ is an integer.* Then one of the hypergeometric series for instance $w_{1,2(0)}$, **15.5.3, 15.5.4** terminates and the corresponding solution is of the form

**15.5.15** $w=z^{\alpha}(1-z)^{\beta}p_n(z)$

where $p_n(z)$ is a polynomial in $z$ of degree $n$. This case is referred to as the degenerate case of the hypergeometric differential equation and its solutions are listed and discussed in great detail in [15.2].

C. *The number $c-a-b$ is an integer, $c$ nonintegral.* Then **15.3.10** to **15.3.12** give the analytic continuation of $w_{1,2(0)}$ into the neighborhood of $z=1$. Similarly **15.3.13** and **15.3.14** give the analytic continuation of $w_{1,2(0)}$ into the neighborhood of $z=\infty$ in case $a-b$ is an integer but not $c$, subject of course to the further restrictions $c-a=0, \pm 1, \pm 2 \ldots$ (For a detailed discussion of all possible cases, see [15.2]).

D. *The number $c=1$.* Then **15.5.3, 15.5.4** are replaced by

**15.5.16** $w_{1(0)}=F(a, b; 1; z)$

**15.5.17** $$w_{2(0)}=F(a,b;1;z)\ln z+\sum_{n=1}^{\infty}\frac{(a)_n(b)_n}{(n!)^2}z^n[\psi(a+n)-\psi(a)+\psi(b+n)-\psi(b)-2\psi(n+1)+2\psi(1)] \qquad (|z|<1)$$

*E. The number* $c=m+1$, $m=1, 2, 3, \ldots$. A fundamental system is

**15.5.18** $$w_{1(0)}=F(a,b;m+1;z)$$

**15.5.19** $$w_{2(0)}=F(a,b;m+1;z)\ln z+\sum_{n=1}^{\infty}\frac{(a)_n(b)_n}{(1+m)_n n!}z^n[\psi(a+n)-\psi(a)+\psi(b+n)-\psi(b)-\psi(m+1+n)$$
$$+\psi(m+1)-\psi(n+1)+\psi(1)]-\sum_{n=1}^{m}\frac{(n-1)!(-m)_n}{(1-a)_n(1-b)_n}z^{-n} \qquad (|z|<1 \text{ and } a,b\neq 0,1,2,\ldots(m-1))$$

*F. The number* $c=1-m$, $m=1, 2, 3, \ldots$. A fundamental system is

**15.5.20** $$w_{1(0)}=z^mF(a+m, b+m; 1+m; z)$$

**15.5.21**
$$w_{2(0)}=z^mF(a+m,b+m;1+m;z)\ln z+z^m\sum_{n=1}^{\infty}z^n\frac{(a+m)_n(b+m)_n}{(1+m)_n n!}[\psi(a+m+n)-\psi(a+m)+\psi(b+m+n)$$
$$-\psi(b+m)-\psi(m+1+n)+\psi(m+1)-\psi(n+1)+\psi(1)]-\sum_{n=1}^{m}\frac{(n-1)!(-m)_n}{(1-a-m)_n(1-b-m)_n}z^{m-n}$$
$$(|z|<1 \text{ and } a,b\neq 0,-1,-2,\ldots-(m-1))$$

## 15.6. Riemann's Differential Equation

The hypergeometric differential equation **15.5.1** with the (regular) singular points 0, 1, ∞ is a special case of Riemann's differential equation with three (regular) singular points $a$, $b$, $c$

**15.6.1**
$$\frac{d^2w}{dz^2}+\left[\frac{1-\alpha-\alpha'}{z-a}+\frac{1-\beta-\beta'}{z-b}+\frac{1-\gamma-\gamma'}{z-c}\right]\frac{dw}{dz}$$
$$+\left[\frac{\alpha\alpha'(a-b)(a-c)}{z-a}+\frac{\beta\beta'(b-c)(b-a)}{z-b}\right.$$
$$\left.+\frac{\gamma\gamma'(c-a)(c-b)}{z-c}\right]\frac{w}{(z-a)(z-b)(z-c)}=0$$

The pairs of the exponents with respect to the singular points $a$; $b$; $c$ are $\alpha$, $\alpha'$; $\beta$, $\beta'$; $\gamma$, $\gamma'$ respectively subject to the condition

**15.6.2** $$\alpha+\alpha'+\beta+\beta'+\gamma+\gamma'=1$$

The complete set of solutions of **15.6.1** is denoted by the symbol

**15.6.3** $$w=P\begin{Bmatrix} a & b & c & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{Bmatrix}$$

### Special Cases of Riemann's *P* Function

(a) The generalized hypergeometric function

**15.6.4** $$w=P\begin{Bmatrix} 0 & \infty & 1 & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{Bmatrix}$$

(b) The hypergeometric function $F(a, b; c; z)$

**15.6.5** $$w=P\begin{Bmatrix} 0 & \infty & 1 & \\ 0 & a & 0 & z \\ 1-c & b & c-a-b & \end{Bmatrix}$$

(c) The Legendre functions $P_\nu^\mu(z)$, $Q_\nu^\mu(z)$

**15.6.6** $$w=P\begin{Bmatrix} 0 & \infty & 1 & \\ -\frac{1}{2}\nu & \frac{1}{2}\mu & 0 & (1-z^2)^{-1} \\ \frac{1}{2}+\frac{1}{2}\nu & -\frac{1}{2}\mu & \frac{1}{2} & \end{Bmatrix}$$

(d) The confluent hypergeometric function

**15.6.7** $$w=P\begin{Bmatrix} 0 & \infty & c & \\ \frac{1}{2}+u & -c & c-k & z \\ \frac{1}{2}-u & 0 & k & \end{Bmatrix}$$

provided lim $c\to\infty$.

### Transformation Formulas for Riemann's *P* Function

**15.6.8**
$$\left(\frac{z-a}{z-b}\right)^k\left(\frac{z-c}{z-b}\right)^l P\left\{\begin{matrix} a & b & c & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{matrix}\right\}=P\left\{\begin{matrix} a & b & c & \\ \alpha+k & \beta-k-l & \gamma+l & z \\ \alpha'+k & \beta'-k-l & \gamma'+l & \end{matrix}\right\}$$

**15.6.9**
$$P\left\{\begin{matrix} a & b & c & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{matrix}\right\}=P\left\{\begin{matrix} a_1 & b_1 & c_1 & \\ \alpha & \beta & \gamma & z_1 \\ \alpha' & \beta' & \gamma' & \end{matrix}\right\}$$

where

**15.6.10**
$$z=\frac{Az_1+B}{Cz_1+D},\ a=\frac{Aa_1+B}{Ca_1+D},\ b=\frac{Ab_1+B}{Cb_1+D},\ c=\frac{Ac_1+B}{Cc_1+D}$$

and $A$, $B$, $C$, $D$ are arbitrary constants such that $AD-BC\neq 0$.

Riemann's $P$ function reduced to the hypergeometric function is

**15.6.11**
$$P\left\{\begin{matrix} a & b & c & \\ \alpha & \beta & \gamma & z \\ \alpha' & \beta' & \gamma' & \end{matrix}\right\}=\left(\frac{z-a}{z-b}\right)^{\alpha}\left(\frac{z-c}{z-b}\right)^{\gamma} P\left\{\begin{matrix} 0 & \infty & 1 & \\ 0 & \alpha+\beta+\gamma & 0 & \frac{(z-a)(c-b)}{(z-b)(c-a)} \\ \alpha'-\alpha & \alpha+\beta'+\gamma & \gamma'-\gamma & \end{matrix}\right\}$$

The $P$ function on the right hand side is Gauss' hypergeometric function (see **15.6.5**). If it is replaced by Kummer's 24 solutions **15.5.3** to **15.5.14** the complete set of 24 solutions for Riemann's differential equation **15.6.1** is obtained. The first of these solutions is for instance by **15.5.3** and **15.6.5**

**15.6.12**
$$w=\left(\frac{z-a}{z-b}\right)^{\alpha}\left(\frac{z-c}{z-b}\right)^{\gamma} F\left[\alpha+\beta+\gamma, \alpha+\beta'+\gamma; 1+\alpha-\alpha'; \frac{(z-a)\,(c-b)}{(z-b)\,(c-a)}\right]$$

## 15.7. Asymptotic Expansions

The behavior of $F(a, b; c; z)$ for large $|z|$ is described by the transformation formulas of **15.3.**

For fixed $a$, $b$, $z$ and large $|c|$ one has [15.8]

**15.7.1**
$$F(a,b;c;z)=\sum_{n=0}^{m}\frac{(a)_n(b)_n}{(c)_n}\frac{z^n}{n!}+O(|c|^{-m-1})$$

For fixed $a$, $c$, $z$, ($c\neq 0, -1, -2, \ldots, 0<|z|<1$) and large $|b|$ one has [15.2]

**15.7.2**
$$\begin{aligned}F(a,b;c;z)=&e^{-i\pi a}[\Gamma(c)/\Gamma(c-a)]\,(bz)^{-a}[1+O(|bz|^{-1})]\\&+[\Gamma(c)/\Gamma(a)]\,e^{bz}(bz)^{a-c}[1+O(|bz|^{-1})]\end{aligned}$$
$$\left(-\frac{3\pi}{2}<\arg(bz)<\tfrac{1}{2}\pi\right)$$

**15.7.3**
$$\begin{aligned}F(a,b;c;z)=&e^{i\pi a}[\Gamma(c)/\Gamma(c-a)]\,(bz)^{-a}[1+O(|bz|^{-1})]\\&+[\Gamma(c)/\Gamma(a)]e^{bz}(bz)^{a-c}[1+O(|bz|^{-1})]\end{aligned}$$
$$(-\tfrac{1}{2}\pi<\arg(bz)<\tfrac{3}{2}\pi)$$

For the case when more than one of the parameters are large consult [15.2].

The author wishes to acknowledge his great indebtedness to his friend, the late Professor E. H. Neville, for invaluable assistance in reading and criticizing the manuscript. Professor Neville generously supplied material from his own work and was responsible for many improvements in matter and arrangement.

The author's best thanks are also due to David S. Liepman and Ruth Zucker for the preparation and checking of the tables and graphs.

# 16. Jacobian Elliptic Functions and Theta Functions

## Mathematical Properties

### Jacobian Elliptic Functions

### 16.1. Introduction

A doubly periodic meromorphic function is called an *elliptic function.*

Let $m$, $m_1$ be numbers such that

$$m+m_1=1.$$

We call $m$ the *parameter*, $m_1$ the *complementary parameter*.

In what follows we shall assume that the parameter $m$ is a real number. Without loss of generality we can then suppose that $0\leq m\leq 1$ (see **16.10, 16.11**).

We define *quarter-periods* $K$ and $iK'$ by

**16.1.1**

$$K(m)=K=\int_0^{\pi/2}\frac{d\theta}{(1-m\sin^2\theta)^{1/2}},$$

$$iK'(m)=iK'=i\int_0^{\pi/2}\frac{d\theta}{(1-m_1\sin^2\theta)^{1/2}}$$

so that $K$ and $K'$ are real numbers. $K$ is called the real, $iK'$ the imaginary quarter-period.

We note that

**16.1.2** $\quad K(m)=K'(m_1)=K'(1-m).$

We also note that if any *one* of the numbers $m$, $m_1$, $K(m)$, $K'(m)$, $K'(m)/K(m)$ is given, all the rest are determined. Thus $K$ and $K'$ can not both be chosen arbitrarily.

In the Argand diagram denote the points 0, $K$, $K+iK'$, $iK'$ by s, c, d, n respectively. These points are at the vertices of a rectangle. The translations of this rectangle by $\lambda K$, $\mu iK'$, where $\lambda$, $\mu$ are given all integral values positive or negative, will lead to the lattice

| | | | |
|---|---|---|---|
| .s | .c | .s | .c |
| .n | .d | .n | .d |
| .s | .c | .s | .c |
| .n | .d | .n | .d |

the pattern being repeated indefinitely on all sides.

Let p, q be any two of the letters s, c, d, n. Then p, q determine in the lattice a minimum rectangle whose sides are of length $K$ and $K'$ and whose vertices s, c, d, n are in counterclockwise order.

**Definition**

The Jacobian elliptic function pq $u$ is defined by the following three properties.

(i) pq $u$ has a simple zero at p and a simple pole at q.

(ii) The step from p to q is a half-period of pq $u$. Those of the numbers $K, iK', K+iK'$ which differ from this step are only quarter-periods.

(iii) The coefficient of the leading term in the expansion of pq $u$ in ascending powers of $u$ about $u=0$ is unity. With regard to (iii) the leading term is $u$, $1/u$, 1 according as $u=0$ is a zero, a pole, or an ordinary point.

Thus the functions with a pole or zero at the origin (i.e., the functions in which one letter is s) are odd, and the others are even.

Should we wish to call explicit attention to the value of the parameter, we write pq $(u|m)$ instead of pq $u$.

The Jacobian elliptic functions can also be defined with respect to certain integrals. Thus if

**16.1.3** $$u=\int_0^{\varphi}\frac{d\theta}{(1-m\sin^2\theta)^{1/2}},$$

the angle $\varphi$ is called the *amplitude*

**16.1.4** $\quad \varphi=\text{am}\ u$

and we define

**16.1.5**

$$\text{sn}\ u=\sin\varphi,\ \text{cn}\ u=\cos\varphi,$$

$$\text{dn}\ u=(1-m\sin^2\varphi)^{1/2}=\Delta(\varphi).$$

Similarly all the functions pq $u$ can be expressed in terms of $\varphi$. This second set of definitions, although seemingly different, is mathematically equivalent to the definition previously given in terms of a lattice. For further explanation of notations, including the interpretation, of such expressions as sn $(\varphi\backslash\alpha)$, cn $(u|m)$, dn $(u, k)$, see **17.2.**

## 16.2. Classification of the Twelve Jacobian Elliptic Functions

**According to Poles and Half-Periods**

| | Pole $iK'$ | Pole $K+iK'$ | Pole $K$ | Pole $0$ | |
|---|---|---|---|---|---|
| Half period $iK'$ | sn $u$ | cd $u$ | dc $u$ | ns $u$ | Periods $2iK'$, $4K+4iK'$, $4K$ |
| Half period $K+iK'$ | cn $u$ | sd $u$ | nc $u$ | ds $u$ | Periods $4iK'$, $2K+2iK'$, $4K$ |
| Half period $K$ | dn $u$ | nd $u$ | sc $u$ | cs $u$ | Periods $4iK'$, $4K+4iK'$, $2K$ |

The three functions in a vertical column are *copolar.*

The four functions in a horizontal line are *coperiodic.* Of the periods quoted in the last line of each row only two are independent.

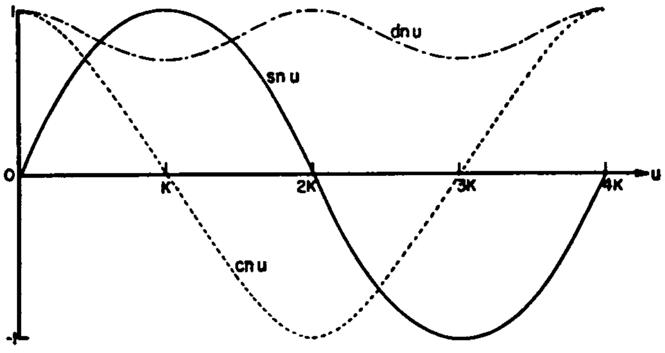

FIGURE 16.1. *Jacobian elliptic functions*

sn $u$, cn $u$, dn $u$

$$m=\frac{1}{2}$$

The curve for cn $(u|\frac{1}{2})$ is the boundary between those which have an inflexion and those which have not.

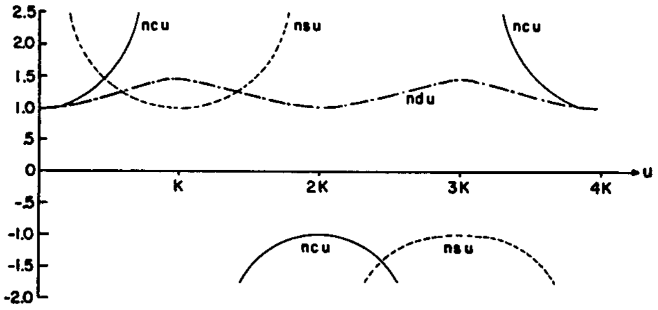

FIGURE 16.2. *Jacobian elliptic functions*

ns $u$, nc $u$, nd $u$

$$m=\frac{1}{2}$$

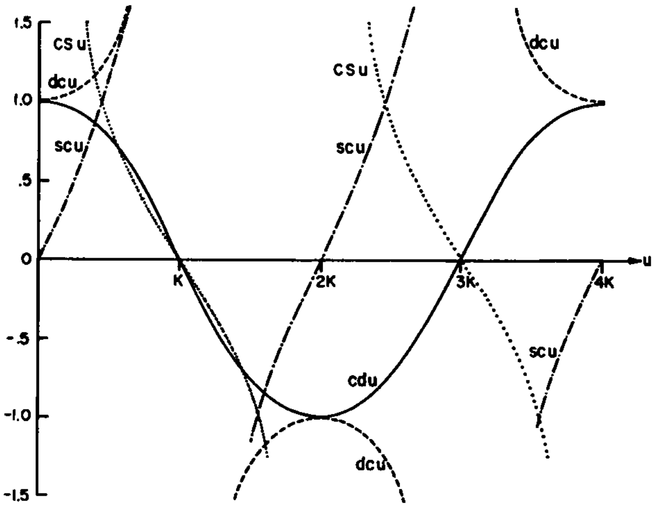

FIGURE 16.3. *Jacobian elliptic functions*

sc $u$, cs $u$, cd $u$, dc $u$

$$m=\frac{1}{2}$$

### 16.3. Relation of the Jacobian Functions to the Copolar Trio sn $u$, cn $u$, dn $u$

**16.3.1** $$\operatorname{cd} u=\frac{\operatorname{cn} u}{\operatorname{dn} u}\qquad \operatorname{dc} u=\frac{\operatorname{dn} u}{\operatorname{cn} u}\qquad \operatorname{ns} u=\frac{1}{\operatorname{sn} u}$$

**16.3.2** $$\operatorname{sd} u=\frac{\operatorname{sn} u}{\operatorname{dn} u}\qquad \operatorname{nc} u=\frac{1}{\operatorname{cn} u}\qquad \operatorname{ds} u=\frac{\operatorname{dn} u}{\operatorname{sn} u}$$

**16.3.3** $$\operatorname{nd} u=\frac{1}{\operatorname{dn} u}\qquad \operatorname{sc} u=\frac{\operatorname{sn} u}{\operatorname{cn} u}\qquad \operatorname{cs} u=\frac{\operatorname{cn} u}{\operatorname{sn} u}$$

And generally if p, q, r are any three of the letters s, c, d, n,

**16.3.4** $$\operatorname{pq} u=\frac{\operatorname{pr} u}{\operatorname{qr} u}$$

provided that when two letters are the same, e.g., pp $u$, the corresponding function is put equal to unity.

## 16.4. Calculation of the Jacobian Functions by Use of the Arithmetic-Geometric Mean (A.G.M.)

For the A.G.M. scale see **17.6.**

To calculate sn $(u|m)$, cn $(u|m)$, and dn $(u|m)$ form the A.G.M. scale starting with

**16.4.1** $$a_0=1,\, b_0=\sqrt{m_1},\, c_0=\sqrt{m},$$

terminating at the step $N$ when $c_N$ is negligible to the accuracy required. Find $\varphi_N$ in degrees where

**16.4.2** $$\varphi_N=2^N a_N u\, \frac{180^\circ}{\pi}$$

and then compute successively $\varphi_{N-1}$, $\varphi_{N-2}$, . . ., $\varphi_1$, $\varphi_0$ from the recurrence relation

**16.4.3** $$\sin\,(2\varphi_{n-1}-\varphi_n)=\frac{c_n}{a_n}\sin\varphi_n.$$

Then

**16.4.4**
$$\text{sn}\,(u|m)=\sin\varphi_0,\quad \text{cn}\,(u|m)=\cos\varphi_0$$
$$\text{dn}\,(u|m)=\frac{\cos\varphi_0}{\cos\,(\varphi_1-\varphi_0)}.$$

From these all the other functions can be determined.

## 16.5. Special Arguments

| | $u$ | sn $u$ | cn $u$ | dn $u$ |
|---|---|---|---|---|
| **16.5.1** | $0$ | $0$ | $1$ | $1$ |
| **16.5.2** | $\frac{1}{2}K$ | $\frac{1}{(1+m_1^{1/2})^{1/2}}$ | $\frac{m_1^{1/4}}{(1+m_1^{1/2})^{1/2}}$ | $m_1^{1/4}$ |
| **16.5.3** | $K$ | $1$ | $0$ | $m_1^{1/2}$ |
| **16.5.4** | $\frac{1}{2}(iK')$ | $im^{-1/4}$ | $\frac{(1+m^{1/2})^{1/2}}{m^{1/4}}$ | $(1+m^{1/2})^{1/2}$ |
| * **16.5.5** | $\frac{1}{2}(K+iK')$ | $2^{-1/2}m^{-1/4}[(1+m^{1/2})^{1/2}+i(1-m^{1/2})^{1/2}]$ | $\left(\frac{m_1}{4m}\right)^{1/4}(1-i)$ | $\left(\frac{m_1}{4}\right)^{1/4}[(1+m_1^{1/2})^{1/2}-i(1-m_1^{1/2})^{1/2}]$ |
| **16.5.6** | $K+\frac{1}{2}(iK')$ | $m^{-1/4}$ | $-i\left(\frac{1-m^{1/2}}{m^{1/2}}\right)^{1/2}$ | $(1-m^{1/2})^{1/2}$ |
| **16.5.7** | $iK'$ | $\infty$ | $\infty$ | $\infty$ |
| **16.5.8** | $\frac{1}{2}K+iK'$ | $(1-m_1^{1/2})^{-1/2}$ | $-i\left(\frac{m_1^{1/2}}{1-m_1^{1/2}}\right)^{1/2}$ | $-im_1^{1/4}$ |
| **16.5.9** | $K+iK'$ | $m^{-1/2}$ | $-i(m_1/m)^{1/2}$ | $0$ |

## 16.6. Jacobian Functions when $m=0$ or 1

| | | $m=0$ | $m=1$ |
|---|---|---|---|
| **16.6.1** | sn $(u\|m)$ | sin $u$ | tanh $u$ |
| **16.6.2** | cn $(u\|m)$ | cos $u$ | sech $u$ |
| **16.6.3** | dn $(u\|m)$ | 1 | sech $u$ |
| **16.6.4** | cd $(u\|m)$ | cos $u$ | 1 |
| **16.6.5** | sd $(u\|m)$ | sin $u$ | sinh $u$ |
| **16.6.6** | nd $(u\|m)$ | 1 | cosh $u$ |
| **16.6.7** | dc $(u\|m)$ | sec $u$ | 1 |
| **16.6.8** | nc $(u\|m)$ | sec $u$ | cosh $u$ |
| **16.6.9** | sc $(u\|m)$ | tan $u$ | sinh $u$ |
| **16.6.10** | ns $(u\|m)$ | csc $u$ | coth $u$ |
| **16.6.11** | ds $(u\|m)$ | csc $u$ | csch $u$ |
| **16.6.12** | cs $(u\|m)$ | cot $u$ | csch $u$ |
| **16.6.13** | am $(u\|m)$ | $u$ | gd $u$ |

---

*See page II.

## 16.7. Principal Terms

When the elliptic function pq $u$ is expanded in ascending powers of $(u-K_r)$, where $K_r$ is one of $0$, $K$, $iK'$, $K+iK'$, the first term of the expansion is called the principal term and has one of the forms $A$, $B\times(u-K_r)$, $C\div(u-K_r)$ according as $K_r$ is an ordinary point, a zero, or a pole of pq $u$. The following list gives these forms, where $\times$ means that the factor $(u-K_r)$ has to be supplied and $\div$ means that the divisor $(u-K_r)$ has to be supplied.

| | $K_r=$ | $0$ | $K$ | $iK'$ | $K+iK'$ |
|---|---|---|---|---|---|
| **16.7.1** | sn $u$ | $1\times$ | $1$ | $m^{-1/2}\div$ | $m^{-1/2}$ |
| **16.7.2** | cn $u$ | $1$ | $-m_1^{1/2}\times$ | $-im^{-1/2}\div$ | $-i\left(\frac{m_1}{m}\right)^{1/2}$ |
| **16.7.3** | dn $u$ | $1$ | $m_1^{1/2}$ | $-i\div$ | $im_1^{1/2}\times$ |
| **16.7.4** | cd $u$ | $1$ | $-1\times$ | $m^{-1/2}$ | $-m^{-1/2}\div$ |
| **16.7.5** | sd $u$ | $1\times$ | $m_1^{-1/2}$ | $im^{-1/2}$ | $-i\frac{1}{(mm_1)^{1/2}}\div$ |
| **16.7.6** | nd $u$ | $1$ | $m_1^{-1/2}$ | $i\times$ | $-im_1^{-1/2}\div$ |
| **16.7.7** | dc $u$ | $1$ | $-1\div$ | $m^{1/2}$ | $-m^{1/2}\times$ |
| **16.7.8** | nc $u$ | $1$ | $-m_1^{-1/2}\div$ | $im^{1/2}\times$ | $i\left(\frac{m}{m_1}\right)^{1/2}$ |
| **16.7.9** | sc $u$ | $1\times$ | $-m_1^{-1/2}\div$ | $i$ | $im_1^{-1/2}$ |
| **16.7.10** | ns $u$ | $1\div$ | $1$ | $m^{1/2}\times$ | $m^{1/2}$ |
| **16.7.11** | ds $u$ | $1\div$ | $m_1^{1/2}$ | $-im^{1/2}$ | $i(mm_1)^{1/2}\times$ |
| **16.7.12** | cs $u$ | $1\div$ | $-m_1^{1/2}\times$ | $-i$ | $-im_1^{1/2}$ |

## 16.8. Change of Argument

| | | $u$ | $-u$ | $u+K$ | $u-K$ | $K-u$ | $u+2K$ | $u-2K$ | $2K-u$ | $u+iK'$ | $u+2iK'$ | $u+K+iK'$ | $u+2K+2iK'$ |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### 16.9. Relations Between the Squares of the Functions

**16.9.1** $-\mathrm{dn}^2 u+m_1=-m\ \mathrm{cn}^2 u=m\ \mathrm{sn}^2 u-m$

**16.9.2** $-m_1\mathrm{nd}^2 u+m_1=-mm_1\mathrm{sd}^2 u=m\ \mathrm{cd}^2 u-m$

**16.9.3** $m_1\mathrm{sc}^2 u+m_1=m_1\mathrm{nc}^2 u=\mathrm{dc}^2 u-m$

**16.9.4** $\mathrm{cs}^2 u+m_1=\mathrm{ds}^2 u=\mathrm{ns}^2 u-m$

In using the above results remember that $m+m_1=1$.

If pq $u$, rt $u$ are any two of the twelve functions, one entry expresses $\mathrm{tq}^2 u$ in terms of $\mathrm{pq}^2 u$ and another expresses $\mathrm{qt}^2 u$ in terms of $\mathrm{rt}^2 u$. Since $\mathrm{tq}^2 u\cdot\mathrm{qt}^2 u=1$, we can obtain from the table the bilinear relation between $\mathrm{pq}^2 u$ and $\mathrm{rt}^2 u$. Thus for the functions cd $u$, sn $u$ we have

**16.9.5** $$\mathrm{nd}^2 u=\frac{1-m\ \mathrm{cd}^2 u}{m_1},\ \mathrm{dn}^2 u=1-m\ \mathrm{sn}^2 u$$

and therefore

**16.9.6** $$(1-m\ \mathrm{cd}^2 u)(1-m\ \mathrm{sn}^2 u)=m_1.$$

### 16.10. Change of Parameter

#### Negative Parameter

If $m$ is a positive number, let

**16.10.1** $$\mu=\frac{m}{1+m},\ \mu_1=\frac{1}{1+m},\ v=\frac{u}{\mu_1^{\frac{1}{2}}}\qquad(0<\mu<1)$$

**16.10.2** $\mathrm{sn}\ (u|-m)=\mu_1^{\frac{1}{2}}\mathrm{sd}\ (v|\mu)$

**16.10.3** $\mathrm{cn}\ (u|-m)=\mathrm{cd}\ (v|\mu)$

**16.10.4** $\mathrm{dn}\ (u|-m)=\mathrm{nd}\ (v|\mu).$

### 16.11. Reciprocal Parameter (Jacobi's Real Transformation)

**16.11.1** $m>0,\ \mu=m^{-1},\ v=um^{1/2}$

**16.11.2** $\mathrm{sn}\ (u|m)=\mu^{1/2}\mathrm{sn}\ (v|\mu)$

**16.11.3** $\mathrm{cn}\ (u|m)=\mathrm{dn}\ (v|\mu)$

**16.11.4** $\mathrm{dn}\ (u|m)=\mathrm{cn}\ (v|\mu)$

Here if $m>1$ then $m^{-1}=\mu<1$.

Thus elliptic functions whose parameter is real can be made to depend on elliptic functions whose parameter lies between 0 and 1.

### 16.12. Descending Landen Transformation (Gauss' Transformation)

To decrease the parameter, let

**16.12.1** $$\mu=\left(\frac{1-m_1^{1/2}}{1+m_1^{1/2}}\right)^2,\ v=\frac{u}{1+\mu^{1/2}},$$

then

**16.12.2** $$\mathrm{sn}\ (u|m)=\frac{(1+\mu^{1/2})\ \mathrm{sn}\ (v|\mu)}{1+\mu^{1/2}\mathrm{sn}^2\ (v|\mu)}$$

**16.12.3** $$\mathrm{cn}\ (u|m)=\frac{\mathrm{cn}\ (v|\mu)\ \mathrm{dn}\ (v|\mu)}{1+\mu^{1/2}\ \mathrm{sn}^2\ (v|\mu)}$$

**16.12.4** $$\mathrm{dn}\ (u|m)=\frac{\mathrm{dn}^2(v|\mu)-(1-\mu^{1/2})}{(1+\mu^{1/2})-\mathrm{dn}^2(v|\mu)}.$$

Note that successive applications can be made conveniently to find sn $(u|m)$ in terms of sn $(v|\mu)$ and dn $(u|m)$ in terms of dn $(v|\mu)$, but that the calculation of cn $(u|m)$ requires all three functions.

### 16.13. Approximation in Terms of Circular Functions

When the parameter $m$ is so small that we may neglect $m^2$ and higher powers, we have the approximations

**16.13.1**

$$\mathrm{sn}\ (u|m)\approx\sin u-\frac{1}{4}\ m(u-\sin u\cos u)\cos u$$

**16.13.2**

$$\mathrm{cn}\ (u|m)\approx\cos u+\frac{1}{4}\ m(u-\sin u\cos u)\sin u$$

**16.13.3** $$\mathrm{dn}\ (u|m)\approx 1-\frac{1}{2}\ m\sin^2 u$$

**16.13.4** $$\mathrm{am}\ (u|m)\approx u-\frac{1}{4}\ m(u-\sin u\cos u).$$

One way of calculating the Jacobian functions is to use Landen's descending transformation to reduce the parameter sufficiently for the above formulae to become applicable. See also **16.14.**

### 16.14. Ascending Landen Transformation

To increase the parameter, let

**16.14.1** $$\mu=\frac{4m^{1/2}}{(1+m^{1/2})^2},\ \mu_1=\left(\frac{1-m^{1/2}}{1+m^{1/2}}\right)^2,\ v=\frac{u}{1+\mu_1^{1/2}}$$

**16.14.2** $$\mathrm{sn}\ (u|m)=(1+\mu_1^{1/2})\ \frac{\mathrm{sn}\ (v|\mu)\ \mathrm{cn}\ (v|\mu)}{\mathrm{dn}\ (v|\mu)}$$

**16.14.3** $$\mathrm{cn}\ (u|m)=\frac{1+\mu_1^{1/2}}{\mu}\ \frac{\mathrm{dn}^2(v|\mu)-\mu_1^{1/2}}{\mathrm{dn}\ (v|\mu)}$$

**16.14.4** $$\mathrm{dn}\ (u|m)=\frac{1-\mu_1^{1/2}}{\mu}\ \frac{\mathrm{dn}^2\ (v|\mu)+\mu_1^{1/2}}{\mathrm{dn}\ (v|\mu)}$$

Note that, when successive applications are to be made, it is simplest to calculate dn $(u|m)$ since this is expressed always in terms of the same function. The calculation of cn $(u|m)$ leads to that of dn $(v|\mu)$.

The calculation of sn $(u|m)$ necessitates the evaluation of all three functions.

## 16.15. Approximation in Terms of Hyperbolic Functions

When the parameter $m$ is so close to unity that $m_1^2$ and higher powers of $m_1$ can be neglected we have the approximations

**16.15.1**

$$\mathrm{sn}\,(u|m)\approx\tanh u+\frac{1}{4}m_1\,(\sinh u\,\cosh u-u)\,\mathrm{sech}^2\,u$$

**16.15.2**

$$\mathrm{cn}\,(u|m)\approx\mathrm{sech}\,u-\frac{1}{4}m_1\,(\sinh u\,\cosh u-u)\,\tanh u\,\mathrm{sech}\,u$$

**16.15.3**

$$\mathrm{dn}\,(u|m)\approx\mathrm{sech}\,u+\frac{1}{4}m_1\,(\sinh u\,\cosh u+u)\,\tanh u\,\mathrm{sech}\,u$$

**16.15.4**

$$\mathrm{am}\,(u|m)\approx\mathrm{gd}\,u+\frac{1}{4}m_1\,(\sinh u\,\cosh u-u)\,\mathrm{sech}\,u.$$

Another way of calculating the Jacobian functions is to use Landen's ascending transformation to increase the parameter sufficiently for the above formulae to become applicable. See also **16.13.**

## 16.16. Derivatives

| | Function | Derivative | |
|---|---|---|---|
| **16.16.1** | sn $u$ | cn $u$ dn $u$ | Pole n |
| **16.16.2** | cn $u$ | $-$sn $u$ dn $u$ | |
| **16.16.3** | dn $u$ | $-m$ sn $u$ cn $u$ | |
| **16.16.4** | cd $u$ | $-m_1$ sd $u$ nd $u$ | Pole d |
| **16.16.5** | sd $u$ | cd $u$ nd $u$ | |
| **16.16.6** | nd $u$ | $m$ sd $u$ cd $u$ | |
| **16.16.7** | dc $u$ | $m_1$ sc $u$ nc $u$ | Pole c |
| **16.16.8** | nc $u$ | sc $u$ dc $u$ | |
| **16.16.9** | sc $u$ | dc $u$ nc $u$ | |
| **16.16.10** | ns $u$ | $-$ds $u$ cs $u$ | Pole s |
| **16.16.11** | ds $u$ | $-$cs $u$ ns $u$ | |
| **16.16.12** | cs $u$ | $-$ns $u$ ds $u$ | |

Note that the derivative is proportional to the product of the two copolar functions.

## 16.17. Addition Theorems

**16.17.1** $\mathrm{sn}(u+v)$

$$=\frac{\mathrm{sn}\,u\cdot\mathrm{cn}\,v\cdot\mathrm{dn}\,v+\mathrm{sn}\,v\cdot\mathrm{cn}\,u\cdot\mathrm{dn}\,u}{1-m\,\mathrm{sn}^2u\cdot\mathrm{sn}^2v}$$

**16.17.2** $\mathrm{cn}(u+v)$

$$=\frac{\mathrm{cn}\,u\cdot\mathrm{cn}\,v-\mathrm{sn}\,u\cdot\mathrm{dn}\,u\cdot\mathrm{sn}\,v\cdot\mathrm{dn}\,v}{1-m\,\mathrm{sn}^2u\,\mathrm{sn}^2v}$$

**16.17.3** $$\mathrm{dn}(u+v)=\frac{\mathrm{dn}\,u\cdot\mathrm{dn}\,v-m\,\mathrm{sn}\,u\cdot\mathrm{cn}\,u\cdot\mathrm{sn}\,v\cdot\mathrm{cn}\,v}{1-m\,\mathrm{sn}^2u\cdot\mathrm{sn}^2v}$$

Addition theorems are derivable one from another and are expressible in a great variety of forms. Thus $\mathrm{ns}(u+v)$ comes from $1/\mathrm{sn}(u+v)$ in the form $(1-m\,\mathrm{sn}^2u\,\mathrm{sn}^2v)/(\mathrm{sn}\,u\,\mathrm{cn}\,v\,\mathrm{dn}\,v+\mathrm{sn}\,v\,\mathrm{cn}\,u\,\mathrm{dn}\,u)$ from **16.17.1.**

Alternatively $\mathrm{ns}(u+v)=m^{1/2}\mathrm{sn}\,\{(iK'-u)-v\}$ which again from **16.17.1** yields the form $(\mathrm{ns}\,u\,\mathrm{cs}\,v\,\mathrm{ds}\,u-\mathrm{ns}\,v\,\mathrm{cs}\,u\,\mathrm{ds}\,v)/(\mathrm{ns}^2u-\mathrm{ns}^2v)$.

The function $\mathrm{pq}(u+v)$ is a rational function of the four functions pq $u$, pq $v$, pq$'u$, pq$'v$.

## 16.18. Double Arguments

**16.18.1** sn $2u$

$$=\frac{2\mathrm{sn}\,u\cdot\mathrm{cn}\,u\cdot\mathrm{dn}\,u}{1-m\,\mathrm{sn}^4u}=\frac{2\mathrm{sn}\,u\cdot\mathrm{cn}\,u\cdot\mathrm{dn}\,u}{\mathrm{cn}^2u+\mathrm{sn}^2u\cdot\mathrm{dn}^2u}$$

**16.18.2** cn $2u$

$$=\frac{\mathrm{cn}^2u-\mathrm{sn}^2u\cdot\mathrm{dn}^2u}{1-m\,\mathrm{sn}^4u}=\frac{\mathrm{cn}^2u-\mathrm{sn}^2u\cdot\mathrm{dn}^2u}{\mathrm{cn}^2u+\mathrm{sn}^2u\cdot\mathrm{dn}^2u}$$

**16.18.3** dn $2u$

$$=\frac{\mathrm{dn}^2u-m\,\mathrm{sn}^2u\cdot\mathrm{cn}^2u}{1-m\,\mathrm{sn}^4u}=\frac{\mathrm{dn}^2u+\mathrm{cn}^2u(\mathrm{dn}^2u-1)}{\mathrm{dn}^2u-\mathrm{cn}^2u(\mathrm{dn}^2u-1)}$$

**16.18.4** $$\frac{1-\mathrm{cn}\,2u}{1+\mathrm{cn}\,2u}=\frac{\mathrm{sn}^2u\cdot\mathrm{dn}^2u}{\mathrm{cn}^2u}$$

**16.18.5** $$\frac{1-\mathrm{dn}\,2u}{1+\mathrm{dn}\,2u}=\frac{m\,\mathrm{sn}^2u\cdot\mathrm{cn}^2u}{\mathrm{dn}^2u}$$

## 16.19. Half Arguments

**16.19.1** $$\mathrm{sn}^2\tfrac{1}{2}u=\frac{1-\mathrm{cn}\,u}{1+\mathrm{dn}\,u}$$

**16.19.2** $$\mathrm{cn}^2\tfrac{1}{2}u=\frac{\mathrm{dn}\,u+\mathrm{cn}\,u}{1+\mathrm{dn}\,u}$$

**16.19.3** $$\mathrm{dn}^2\tfrac{1}{2}\,u=\frac{m_1+\mathrm{dn}\,u+m\,\mathrm{cn}\,u}{1+\mathrm{dn}\,u}$$

## 16.20. Jacobi's Imaginary Transformation

**16.20.1** $\mathrm{sn}(iu|m)=i\,\mathrm{sc}(u|m_1)$

**16.20.2** $\mathrm{cn}(iu|m)=\mathrm{nc}(u|m_1)$

**16.20.3** $\mathrm{dn}(iu|m)=\mathrm{dc}(u|m_1)$

### 16.21. Complex Arguments

With the abbreviations

**16.21.1**

$$\mathrm{s}=\mathrm{sn}(x|m),\ \mathrm{c}=\mathrm{cn}(x|m),\ \mathrm{d}=\mathrm{dn}(x|m),\ \mathrm{s}_1=\mathrm{sn}(y|m_1),$$
$$\mathrm{c}_1=\mathrm{cn}(y|m_1),\ \mathrm{d}_1=\mathrm{dn}(y|m_1)$$

**16.21.2** $$\mathrm{sn}(x+iy|m)=\frac{\mathrm{s}\cdot\mathrm{d}_1+i\mathrm{c}\cdot\mathrm{d}\cdot\mathrm{s}_1\cdot\mathrm{c}_1}{\mathrm{c}_1^2+m\mathrm{s}^2\cdot\mathrm{s}_1^2}$$

**16.21.3** $$\mathrm{cn}(x+iy|m)=\frac{\mathrm{c}\cdot\mathrm{c}_1-i\mathrm{s}\cdot\mathrm{d}\cdot\mathrm{s}_1\cdot\mathrm{d}_1}{\mathrm{c}_1^2+m\mathrm{s}^2\cdot\mathrm{s}_1^2}$$

**16.21.4** $$\mathrm{dn}(x+iy|m)=\frac{\mathrm{d}\cdot\mathrm{c}_1\cdot\mathrm{d}_1-im\mathrm{s}\cdot\mathrm{c}\cdot\mathrm{s}_1}{\mathrm{c}_1^2+m\mathrm{s}^2\cdot\mathrm{s}_1^2}$$

### 16.22. Leading Terms of the Series in Ascending Powers of $u$

**16.22.1**

$$\mathrm{sn}(u|m)=u-(1+m)\frac{u^3}{3!}+(1+14m+m^2)\frac{u^5}{5!}$$
$$-(1+135m+135m^2+m^3)\frac{u^7}{7!}+\ldots$$

**16.22.2**

$$\mathrm{cn}(u|m)=1-\frac{u^2}{2!}+(1+4m)\frac{u^4}{4!}$$
$$-(1+44m+16m^2)\frac{u^6}{6!}+\ldots$$

**16.22.3**

$$\mathrm{dn}(u|m)=1-m\frac{u^2}{2!}+m(4+m)\frac{u^4}{4!}$$
$$-m(16+44m+m^2)\frac{u^6}{6!}+\ldots$$

No formulae are known for the general coefficients in these series.

### 16.23. Series Expansions in Terms of the Nome $q=e^{-\pi K'/K}$ and the Argument $v=\pi u/(2K)$

**16.23.1** $$\mathrm{sn}\ (u|m)=\frac{2\pi}{m^{1/2}K}\sum_{n=0}^{\infty}\frac{q^{n+1/2}}{1-q^{2n+1}}\sin\ (2n+1)v$$

**16.23.2** $$\mathrm{cn}\ (u|m)=\frac{2\pi}{m^{1/2}K}\sum_{n=0}^{\infty}\frac{q^{n+1/2}}{1+q^{2n+1}}\cos\ (2n+1)v$$

**16.23.3** $$\mathrm{dn}\ (u|m)=\frac{\pi}{2K}+\frac{2\pi}{K}\sum_{n=1}^{\infty}\frac{q^n}{1+q^{2n}}\cos 2nv$$

**16.23.4**

$$\mathrm{cd}\ (u|m)=\frac{2\pi}{m^{1/2}K}\sum_{n=0}^{\infty}\frac{(-1)^n q^{n+1/2}}{1-q^{2n+1}}\cos\ (2n+1)v$$

**16.23.5**

$$\mathrm{sd}\ (u|m)=\frac{2\pi}{(mm_1)^{1/2}K}\sum_{n=0}^{\infty}(-1)^n\frac{q^{n+1/2}}{1+q^{2n+1}}\sin\ (2n+1)v$$

**16.23.6**

$$\mathrm{nd}\ (u|m)=\frac{\pi}{2m_1^{1/2}K}+\frac{2\pi}{m_1^{1/2}K}\sum_{n=1}^{\infty}(-1)^n\frac{q^n}{1+q^{2n}}\cos 2nv$$

**16.23.7**

$$\mathrm{dc}\ (u|m)=\frac{\pi}{2K}\sec v$$
$$+\frac{2\pi}{K}\sum_{n=0}^{\infty}(-1)^n\frac{q^{2n+1}}{1-q^{2n+1}}\cos\ (2n+1)v$$

**16.23.8**

$$\mathrm{nc}\ (u|m)=\frac{\pi}{2m_1^{1/2}K}\sec v$$
$$-\frac{2\pi}{m_1^{1/2}K}\sum_{n=0}^{\infty}(-1)^n\frac{q^{2n+1}}{1+q^{2n+1}}\cos\ (2n+1)v$$

**16.23.9**

$$\mathrm{sc}\ (u|m)=\frac{\pi}{2m_1^{1/2}K}\tan v$$
$$+\frac{2\pi}{m_1^{1/2}K}\sum_{n=1}^{\infty}(-1)^n\frac{q^{2n}}{1+q^{2n}}\sin 2nv$$

**16.23.10**

$$\mathrm{ns}\ (u|m)=\frac{\pi}{2K}\csc v-\frac{2\pi}{K}\sum_{n=0}^{\infty}\frac{q^{2n+1}}{1-q^{2n+1}}\sin\ (2n+1)v$$

**16.23.11**

$$\mathrm{ds}\ (u|m)=\frac{\pi}{2K}\csc v-\frac{2\pi}{K}\sum_{n=0}^{\infty}\frac{q^{2n+1}}{1+q^{2n+1}}\sin\ (2n+1)v$$

**16.23.12**

$$\mathrm{cs}\ (u|m)=\frac{\pi}{2K}\cot v-\frac{2\pi}{K}\sum_{n=1}^{\infty}\frac{q^{2n}}{1+q^{2n}}\sin 2nv$$

### 16.24. Integrals of the Twelve Jacobian Elliptic Functions

**16.24.1** $\int \mathrm{sn}\ u\ du=m^{-1/2}\ln\ (\mathrm{dn}\ u-m^{1/2}\mathrm{cn}\ u)$

**16.24.2** $\int \mathrm{cn}\ u\ du=m^{-1/2}\arccos\ (\mathrm{dn}\ u)$

**16.24.3** $\int \mathrm{dn}\ u\ du=\arcsin\ (\mathrm{sn}\ u)$

**16.24.4** $\int \mathrm{cd}\ u\ du=m^{-1/2}\ln\ (\mathrm{nd}\ u+m^{1/2}\mathrm{sd}\ u)$

**16.24.5** $\int \mathrm{sd}\ u\ du=(mm_1)^{-1/2}\arcsin\ (-m^{1/2}\mathrm{cd}\ u)$

**16.24.6** $\int \mathrm{nd}\ u\ du=m_1^{-1/2}\arccos\ (\mathrm{cd}\ u)$

**16.24.7** $\int \mathrm{dc}\ u\ du=\ln\ (\mathrm{nc}\ u+\mathrm{sc}\ u)$

**16.24.8** $\int \mathrm{nc}\ u\ du=m_1^{-1/2}\ln\ (\mathrm{dc}\ u+m_1^{1/2}\mathrm{sc}\ u)$

**16.24.9** $\int \mathrm{sc}\ u\ du=m_1^{-1/2}\ln\ (\mathrm{dc}\ u+m_1^{1/2}\mathrm{nc}\ u)$

**16.24.10** $\int \mathrm{ns}\ u\ du=\ln\ (\mathrm{ds}\ u-\mathrm{cs}\ u)$

**16.24.11** $\int \mathrm{ds}\ u\ du=\ln\ (\mathrm{ns}\ u-\mathrm{cs}\ u)$

**16.24.12** $\int \mathrm{cs}\ u\ du=\ln\ (\mathrm{ns}\ u-\mathrm{ds}\ u)$

In numerical use of the above table certain restrictions must be put on $u$ in order to keep the arguments of the logarithms positive and to avoid trouble with many-valued inverse circular functions.

### 16.25. Notation for the Integrals of the Squares of the Twelve Jacobian Elliptic Functions

**16.25.1** $$\mathrm{Pq}\,u=\int_0^u \mathrm{pq}^2 t\,dt \text{ when } \mathrm{q}\neq \mathrm{s}$$

**16.25.2** $$\mathrm{Ps}\,u=\int_0^u \left(\mathrm{pq}^2 t-\frac{1}{t^2}\right)dt-\frac{1}{u}$$

**Examples**

$$\mathrm{Cd}\,u=\int_0^u \mathrm{cd}^2 t\,dt,\ \mathrm{Ns}\,u=\int_0^u\left(\mathrm{ns}^2 t-\frac{1}{t^2}\right)dt-\frac{1}{u}$$

### 16.26. Integrals in Terms of the Elliptic Integral of the Second Kind (see 17.4)

**16.26.1** $$m\mathrm{Sn}\,u=-E(u)+u$$

**16.26.2** $$m\mathrm{Cn}\,u=E(u)-m_1u \qquad \text{Pole n}$$

**16.26.3** $$\mathrm{Dn}\,u=E(u)$$

**16.26.4** $$m\mathrm{Cd}\,u=-E(u)+u+m\,\mathrm{sn}\,u\,\mathrm{cd}\,u$$

**16.26.5** $$mm_1\mathrm{Sd}\,u=E(u)-m_1u-m\,\mathrm{sn}\,u\,\mathrm{cd}\,u \qquad \text{Pole d}$$

**16.26.6** $$m_1\mathrm{Nd}\,u=E(u)-m\,\mathrm{sn}\,u\,\mathrm{cd}\,u$$

**16.26.7** $$\mathrm{Dc}\,u=-E(u)+u+\mathrm{sn}\,u\,\mathrm{dc}\,u$$

**16.26.8** $$m_1\mathrm{Nc}\,u=-E(u)+m_1u+\mathrm{sn}\,u\,\mathrm{dc}\,u \qquad \text{Pole c}$$

**16.26.9** $$m_1\mathrm{Sc}\,u=-E(u)+\mathrm{sn}\,u\,\mathrm{dc}\,u$$

**16.26.10** $$\mathrm{Ns}\,u=-E(u)+u-\mathrm{cn}\,u\,\mathrm{ds}\,u$$

**16.26.11** $$\mathrm{Ds}\,u=-E(u)+m_1u-\mathrm{cn}\,u\,\mathrm{ds}\,u \qquad \text{Pole s}$$

**16.26.12** $$\mathrm{Cs}\,u=-E(u)-\mathrm{cn}\,u\,\mathrm{ds}\,u$$

All the above may be expressed in terms of Jacobi's zeta function (see **17.4.27**).

$$Z(u)=E(u)-\frac{E}{K}u,\text{ where } E=E(K)$$

### 16.27. Theta Functions; Expansions in Terms of the Nome $q$

**16.27.1** $$\vartheta_1(z,q)=\vartheta_1(z)=2q^{1/4}\sum_{n=0}^{\infty}(-1)^n q^{n(n+1)}\sin(2n+1)z$$

**16.27.2** $$\vartheta_2(z,q)=\vartheta_2(z)=2q^{1/4}\sum_{n=0}^{\infty}q^{n(n+1)}\cos(2n+1)z$$

**16.27.3** $$\vartheta_3(z,q)=\vartheta_3(z)=1+2\sum_{n=1}^{\infty}q^{n^2}\cos 2nz$$

**16.27.4** $$\vartheta_4(z,q)=\vartheta_4(z)=1+2\sum_{n=1}^{\infty}(-1)^n q^{n^2}\cos 2nz$$

Theta functions are important because every one of the Jacobian elliptic functions can be expressed as the ratio of two theta functions. See **16.36.**

The notation shows these functions as depending on the variable $z$ and the nome $q$, $|q|<1$. In this case, here and elsewhere, the convergence is not dependent on the trigonometrical terms. In their relation to the Jacobian elliptic functions, we note that the nome $q$ is given by

$$q=e^{-\pi K'/K},$$

where $K$ and $iK'$ are the quarter periods. Since $q=q(m)$ is determined when the parameter $m$ is given, we can also regard the theta functions as dependent upon $m$ and then we write

$$\vartheta_a(z,q)=\vartheta_a(z|m),\ a=1,2,3,4$$

but when no ambiguity is to be feared, we write $\vartheta_a(z)$ simply.

The above notations are those given in Modern Analysis [16.6].

There is a bewildering variety of notations, for example the function $\vartheta_4(z)$ above is sometimes denoted by $\vartheta_0(z)$ or $\vartheta(z)$; see the table given in Modern Analysis [16.6]. Further the argument $u=2Kz/\pi$ is frequently used so that in consulting books caution should be exercised.

### 16.28. Relations Between the Squares of the Theta Functions

**16.28.1** $$\vartheta_1^2(z)\vartheta_4^2(0)=\vartheta_3^2(z)\vartheta_2^2(0)-\vartheta_2^2(z)\vartheta_3^2(0)$$

**16.28.2** $$\vartheta_2^2(z)\vartheta_4^2(0)=\vartheta_4^2(z)\vartheta_2^2(0)-\vartheta_1^2(z)\vartheta_3^2(0)$$

**16.28.3** $$\vartheta_3^2(z)\vartheta_4^2(0)=\vartheta_4^2(z)\vartheta_3^2(0)-\vartheta_1^2(z)\vartheta_2^2(0)$$

**16.28.4** $$\vartheta_4^2(z)\vartheta_4^2(0)=\vartheta_3^2(z)\vartheta_3^2(0)-\vartheta_2^2(z)\vartheta_2^2(0)$$

**16.28.5** $$\vartheta_2^4(0)+\vartheta_4^4(0)=\vartheta_3^4(0)$$

Note also the important relation

**16.28.6** $$\vartheta_1'(0)=\vartheta_2(0)\vartheta_3(0)\vartheta_4(0)\text{ or }\vartheta_1'=\vartheta_2\vartheta_3\vartheta_4$$

### 16.29. Logarithmic Derivatives of the Theta Functions

**16.29.1** $$\frac{\vartheta_1'(u)}{\vartheta_1(u)}=\cot u+4\sum_{n=1}^{\infty}\frac{q^{2n}}{1-q^{2n}}\sin 2nu$$

**16.29.2**

$$\frac{\vartheta_2'(u)}{\vartheta_2(u)}=-\tan u+4\sum_{n=1}^{\infty}(-1)^n\frac{q^{2n}}{1-q^{2n}}\sin 2nu$$

**16.29.3** $$\frac{\vartheta_3'(u)}{\vartheta_3(u)}=4\sum_{n=1}^{\infty}(-1)^n\frac{q^n}{1-q^{2n}}\sin 2nu$$

**16.29.4** $$\frac{\vartheta_4'(u)}{\vartheta_4(u)}=4\sum_{n=1}^{\infty}\frac{q^n}{1-q^{2n}}\sin 2nu$$

## 16.30. Logarithms of Theta Functions of Sum and Difference

**16.30.1**

$$\ln\frac{\vartheta_1(\alpha+\beta)}{\vartheta_1(\alpha-\beta)}=\ln\frac{\sin(\alpha+\beta)}{\sin(\alpha-\beta)}+4\sum_{n=1}^{\infty}\frac{1}{n}\frac{q^{2n}}{1-q^{2n}}\sin 2n\alpha\sin 2n\beta$$

**16.30.2**

$$\ln\frac{\vartheta_2(\alpha+\beta)}{\vartheta_2(\alpha-\beta)}=\ln\frac{\cos(\alpha+\beta)}{\cos(\alpha-\beta)}+4\sum_{n=1}^{\infty}\frac{(-1)^n}{n}\frac{q^{2n}}{1-q^{2n}}\sin 2n\alpha\sin 2n\beta$$

**16.30.3**

$$\ln\frac{\vartheta_3(\alpha+\beta)}{\vartheta_3(\alpha-\beta)}=4\sum_{n=1}^{\infty}\frac{(-1)^n}{n}\frac{q^n}{1-q^{2n}}\sin 2\,n\alpha\sin 2n\beta$$

**16.30.4**

$$\ln\frac{\vartheta_4(\alpha+\beta)}{\vartheta_4(\alpha-\beta)}=4\sum_{n=1}^{\infty}\frac{1}{n}\frac{q^n}{1-q^{2n}}\sin 2n\alpha\sin 2n\beta$$

The corresponding expressions when $\beta=i\gamma$ are easily deduced by use of the formulae **4.3.55** and **4.3.56.**

## 16.31. Jacobi's Notation for Theta Functions

**16.31.1** $$\Theta(u|m)=\Theta(u)=\vartheta_4(v),\qquad v=\frac{\pi u}{2K}$$

**16.31.2** $$\Theta_1(u|m)=\Theta_1(u)=\vartheta_3(v)=\Theta(u+K)$$

**16.31.3** $$\mathrm{H}(u|m)=\mathrm{H}(u)=\vartheta_1(v)$$

**16.31.4** $$\mathrm{H}_1(u|m)=\mathrm{H}_1(u)=\vartheta_2(v)=\mathrm{H}(u+K)$$

## 16.32. Calculation of Jacobi's Theta Function $\Theta(u|m)$ by Use of the Arithmetic-Geometric Mean

Form the A.G.M. scale starting with

**16.32.1** $$a_0=1,\ b_0=\sqrt{m_1},\ c_0=\sqrt{m}$$

terminating with the $N$th step when $c_N$ is negligible to the accuracy required. Find $\varphi_N$ in degrees, where

**16.32.2** $$\varphi_N=2^N a_N u\,\frac{180^\circ}{\pi}$$

and then compute successively $\varphi_{N-1}$, $\varphi_{N-2}$, . . ., $\varphi_1$, $\varphi_0$ from the recurrence relation

**16.32.3** $$\sin(2\varphi_{n-1}-\varphi_n)=\frac{c_n}{a_n}\sin\varphi_n.$$

Then

**16.32.4**

$$\ln\Theta(u|m)=\frac{1}{2}\ln\frac{2m_1^{1/2}K(m)}{\pi}+\frac{1}{2}\ln\frac{\cos(\varphi_1-\varphi_0)}{\cos\varphi_0}+\frac{1}{4}\ln\sec(2\varphi_0-\varphi_1)+\frac{1}{8}\ln\sec(2\varphi_1-\varphi_2)+\ldots+\frac{1}{2^{N+1}}\ln\sec(2\varphi_{N-1}-\varphi_N)$$

## 16.33. Addition of Quarter-Periods to Jacobi's Eta and Theta Functions

| $u$ | $-u$ | $u+K$ | $u+2K$ | $u+iK'$ | $u+2iK'$ | $u+K+iK'$ | $u+2K+2iK'$ |
|---|---|---|---|---|---|---|---|
| **16.33.1**<br>$\mathrm{H}(u)$ | $-\mathrm{H}(u)$ | $\mathrm{H}_1(u)$ | $-\mathrm{H}(u)$ | $iM(u)\Theta(u)$ | $-N(u)\mathrm{H}(u)$ | $M(u)\Theta_1(u)$ | $N(u)\mathrm{H}(u)$ |
| **16.33.2**<br>$\mathrm{H}_1(u)$ | $\mathrm{H}_1(u)$ | $-\mathrm{H}(u)$ | $-\mathrm{H}_1(u)$ | $M(u)\Theta_1(u)$ | $N(u)\mathrm{H}_1(u)$ | $-iM(u)\Theta(u)$ | $-N(u)\mathrm{H}_1(u)$ |
| **16.33.3**<br>$\Theta_1(u)$ | $\Theta_1(u)$ | $\Theta(u)$ | $\Theta_1(u)$ | $M(u)\mathrm{H}_1(u)$ | $N(u)\Theta_1(u)$ | $iM(u)\mathrm{H}(u)$ | $N(u)\Theta_1(u)$ |
| **16.33.4**<br>$\Theta(u)$ | $\Theta(u)$ | $\Theta_1(u)$ | $\Theta(u)$ | $iM(u)\mathrm{H}(u)$ | $-N(u)\Theta(u)$ | $M(u)\mathrm{H}_1(u)$ | $-N(u)\Theta(u)$ |

where

$$M(u)=\left[\exp\left(-\frac{\pi iu}{2K}\right)\right]q^{-\frac{1}{4}},$$

$$N(u)=\left[\exp\left(-\frac{\pi iu}{K}\right)\right]q^{-1}$$

$\mathrm{H}(u)$ and $\mathrm{H}_1(u)$ have the period $4K$. $\Theta(u)$ and $\Theta_1(u)$ have the period $2K$.

$2iK'$ is a quasi-period for all four functions, that is to say, increase of the argument by $2iK'$ multiplies the function by a factor.

### 16.34. Relation of Jacobi's Zeta Function to the Theta Functions

$$Z(u)=\frac{\partial}{\partial u}\ln\Theta(u)$$

**16.34.1** $$Z(u)=\frac{\pi}{2K}\,\frac{\vartheta_1'\left(\frac{\pi u}{2K}\right)}{\vartheta_1\left(\frac{\pi u}{2K}\right)}-\frac{\text{cn}\,u\,\text{dn}\,u}{\text{sn}\,u}$$

**16.34.2** $$=\frac{\pi}{2K}\,\frac{\vartheta_2'\left(\frac{\pi u}{2K}\right)}{\vartheta_2\left(\frac{\pi u}{2K}\right)}+\frac{\text{dn}\,u\,\text{sn}\,u}{\text{cn}\,u}$$

**16.34.3** $$=\frac{\pi}{2K}\,\frac{\vartheta_3'\left(\frac{\pi u}{2K}\right)}{\vartheta_3\left(\frac{\pi u}{2K}\right)}-m\,\frac{\text{sn}\,u\,\text{cn}\,u}{\text{dn}\,u}$$

**16.34.4** $$=\frac{\pi}{2K}\,\frac{\vartheta_4'\left(\frac{\pi u}{2K}\right)}{\vartheta_4\left(\frac{\pi u}{2K}\right)}$$

### 16.35. Calculation of Jacobi's Zeta Function *Z(u|m)* by Use of the Arithmetic-Geometric Mean

Form the A.G.M. scale **17.6** starting with

**16.35.1** $$a_0=1,\ b_0=\sqrt{m_1},\ c_0=\sqrt{m}$$

terminating at the $N$th step when $c_N$ is negligible to the accuracy required. Find $\varphi_N$ in degrees where

**16.35.2** $$\varphi_N=2^N a_N u\,\frac{180^\circ}{\pi}$$

and then compute successively $\varphi_{N-1}$, $\varphi_{N-2}$, . . ., $\varphi_1$, $\varphi_0$ from the recurrence relation

**16.35.3** $$\sin(2\varphi_{n-1}-\varphi_n)=\frac{c_n}{a_n}\sin\varphi_n.$$

Then

**16.35.4**

$$Z(u|m)=c_1\sin\varphi_1+c_2\sin\varphi_2+\ldots+c_N\sin\varphi_N.$$

### 16.36. Neville's Notation for Theta Functions

These functions are defined in terms of Jacobi's theta functions of **16.31** by

**16.36.1** $$\vartheta_s(u)=\frac{\mathrm{H}(u)}{\mathrm{H}'(0)},\ \vartheta_c(u)=\frac{\mathrm{H}(u+K)}{\mathrm{H}(K)}$$

**16.36.2** $$\vartheta_d(u)=\frac{\Theta(u+K)}{\Theta(K)},\ \vartheta_n(u)=\frac{\Theta(u)}{\Theta(0)}.$$

If $\lambda$, $\mu$ are any integers positive, negative, or zero the points $u_0+2\lambda K+2\mu iK'$ are said to be *congruent to* $u_0$.

$\vartheta_s(u)$ has zeros at the points congruent to 0
$\vartheta_c(u)$ has zeros at the points congruent to $K$
$\vartheta_n(u)$ has zeros at the points congruent to $iK'$
$\vartheta_d(u)$ has zeros at the points congruent to $K+iK'$

Thus the suffix secures that the function $\vartheta_p(u)$ has zeros at the points marked p in the introductory diagram in **16.1.2**, and the constant by which Jacobi's function is divided secures that the leading coefficient of $\vartheta_p(u)$ at the origin is unity. Therefore the functions have the fundamentally important property that if p, q are any two of the letters s, c, n, d, the Jacobian elliptic function pq $u$ is given by

**16.36.3** $$\text{pq}\,u=\frac{\vartheta_p(u)}{\vartheta_q(u)}.$$

These functions also have the property

**16.36.4** $$m_1^{-1/4}\vartheta_c(K-u)=\vartheta_s(u)$$

**16.36.5** $$m_1^{-1/4}\vartheta_d(K-u)=\vartheta_n(u),$$

for complementary arguments $u$ and $K-u$.

In terms of the theta functions defined in **16.27**, let $v=\pi u/(2K)$, then

**16.36.6** $$\vartheta_s(u)=\frac{2K\vartheta_1(v)}{\vartheta_1'(0)},\ \vartheta_c(u)=\frac{\vartheta_2(v)}{\vartheta_2(0)}$$

**16.36.7** $$\vartheta_d(u)=\frac{\vartheta_3(v)}{\vartheta_3(0)},\ \vartheta_n(u)=\frac{\vartheta_4(v)}{\vartheta_4(0)}.$$

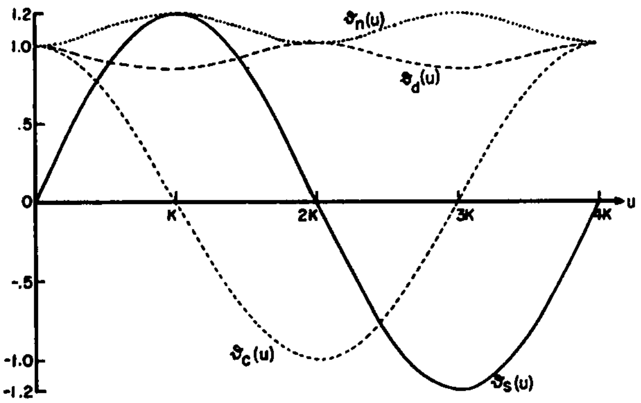

FIGURE 16.4. *Neville's theta functions*
$\vartheta_s(u)$, $\vartheta_c(u)$, $\vartheta_d(u)$, $\vartheta_n(u)$
$m=\frac{1}{2}$

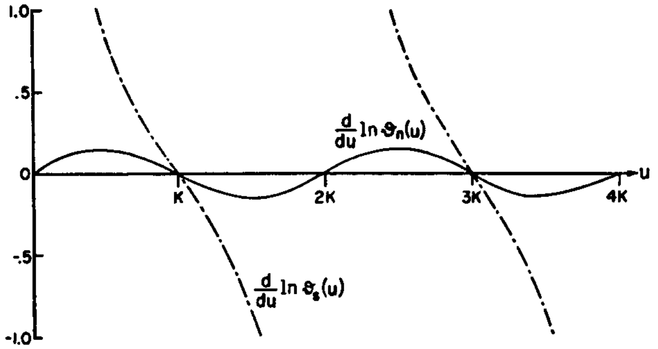

FIGURE 16.5. *Logarithmic derivatives of theta functions*

$$\frac{d}{du}\ln\vartheta_s(u),\ \frac{d}{du}\ln\vartheta_n(u)$$

$$m=\frac{1}{2}$$

### 16.37. Expression as Infinite Products

$$q=q(m),\ v=\pi u/(2K)$$

**16.37.1**

$$\vartheta_s(u)=\left(\frac{16q}{mm_1}\right)^{1/6}\sin v\prod_{n=1}^{\infty}(1-2q^{2n}\cos 2v+q^{4n})$$

**16.37.2**

$$\vartheta_c(u)=\left(\frac{16qm_1^{1/2}}{m}\right)^{1/6}\cos v\prod_{n=1}^{\infty}(1+2q^{2n}\cos 2v+q^{4n})$$

**16.37.3**

$$\vartheta_d(u)=\left(\frac{mm_1}{16q}\right)^{1/12}\prod_{n=1}^{\infty}(1+2q^{2n-1}\cos 2v+q^{4n-2})$$

**16.37.4**

$$\vartheta_n(u)=\left(\frac{m}{16qm_1^2}\right)^{1/12}\prod_{n=1}^{\infty}(1-2q^{2n-1}\cos 2v+q^{4n-2})$$

### 16.38. Expression as Infinite Series

Let $v=\pi u/(2K)$

**16.38.1**

$$\vartheta_s(u)=\left[\frac{2\pi q^{1/2}}{m^{1/2}m_1^{1/2}K}\right]^{1/2}\sum_{n=0}^{\infty}(-1)^n q^{n(n+1)}\sin(2n+1)v$$

**16.38.2** $$\vartheta_c(u)=\left[\frac{2\pi q^{1/2}}{m^{1/2}K}\right]^{1/2}\sum_{n=0}^{\infty}q^{n(n+1)}\cos(2n+1)v$$

**16.38.3** $$\vartheta_d(u)=\left[\frac{\pi}{2K}\right]^{1/2}\{1+2\sum_{n=1}^{\infty}q^{n^2}\cos 2nv\}$$

**16.38.4**

$$\vartheta_n(u)=\left[\frac{\pi}{2m_1^{1/2}K}\right]^{1/2}\{1+2\sum_{n=1}^{\infty}(-1)^n q^{n^2}\cos 2nv\}$$

**16.38.5** $$(2K/\pi)^{1/2}=1+2q+2q^4+2q^9+\ldots=\vartheta_3(0,q)$$

**16.38.6**

$$(2K'/\pi)^{1/2}=1+2q_1+2q_1^4+2q_1^9+\ldots=\vartheta_3(0,q_1)$$

**16.38.7**

$$(2m^{1/2}K/\pi)^{1/2}=2q^{1/4}(1+q^2+q^6+q^{12}+q^{20}+\ldots)$$
$$=\vartheta_2(0,q)$$

**16.38.8**

$$(2m_1^{1/2}K/\pi)^{1/2}=1-2q+2q^4-2q^9+\ldots=\vartheta_4(0,q).$$

## Numerical Methods

### 16.39. Use and Extension of the Tables

**Example 1.** Calculate nc (1.99650|.64) to 4S. From **Table 17.1,** 1.99650$=K+.001$. From the table of principal terms

$$\text{nc}\ u=-m_1^{-1/2}/(u-K)+\ldots$$

$$\text{nc}\ (K+.001|.64)=\frac{-(.36)^{-1/2}}{.001}+\ldots$$
$$=-\frac{10000}{6}+\ldots$$
$$=-1667+\ldots$$

and since the next term is of order .001 this value $-1667$ is correct to at least 4S.

**Example 2.** Use the descending Landen transformation to calculate dn (.20|.19) to 6D.

Here $m=.19$, $m_1^{1/2}=.9$ and so from **16.12.1**

$$\mu=\left(\frac{1}{19}\right)^2,\ 1+\mu^{1/2}=\frac{20}{19},\ v=.19.$$

Also

$$\mu^2=\left(\frac{1}{19}\right)^4=10^{-6}\times 7.67$$

which is negligible.

From **16.12.4**

$$\text{dn}(.20|.19)=\frac{\text{dn}^2\left[.19\left|\left(\frac{1}{19}\right)^2\right.\right]-\left(1-\frac{1}{19}\right)}{\left(1+\frac{1}{19}\right)-\text{dn}^2\left[.19\left|\left(\frac{1}{19}\right)^2\right.\right]}.$$

Now from **16.13.3**

$$\text{dn}\left[.19\left|\left(\frac{1}{19}\right)^2\right.\right]=.999951$$

whence dn (.20|.19) = .996253.

**Example 3.** Use the ascending Landen transformation to calculate dn (.20|.81) to 5D.

From **16.14.1**

$$\mu=\frac{4(.9)}{(1.9)^2}=\frac{360}{361},\ \mu_1=\left(\frac{1}{19}\right)^2$$

$$1+\mu_1^{1/2}=\frac{20}{19},\quad v=\frac{19}{20}\times.20=.19,$$

$\mu_1^2$ is negligible to 4D. Thus

$$\mathrm{dn}\,(.20|.81)=\frac{19}{20}\times\frac{\mathrm{dn}^2\left(.19\,\middle|\,\frac{360}{361}\right)+\frac{1}{19}}{\mathrm{dn}\left(.19\,\middle|\,\frac{360}{361}\right)}.$$

From **16.15.3**

$$\begin{aligned}\mathrm{dn}\left(.19\,\middle|\,\frac{360}{361}\right)&=\mathrm{sech}\,(.19)+\frac{1}{4}\times\frac{1}{361}\tanh .19\ \mathrm{sech}\ .19\\&\qquad[\sinh .19\cosh .19+.19]\\&=.982218+\frac{1}{4}\times\frac{1}{361}\,(.187746)(.982218)\\&\qquad[(.191145)(1.01810)+.19]\\&=.982218+\frac{1}{4}\times\frac{1}{361}\,(.184408)[.384605]\\&=.982218+.000049=.982267.\end{aligned}$$

Thus dn $(.20|.81)=.98406$.

**Example 4.** Use the ascending Landen transformation to calculate cn $(.20|.81)$ to 6D.

Using **16.14.4,** we calculate dn $(.20|.81)$ and deduce cn $(.20|.81)$ from **16.14.3** settling the sign from **Figure 16.1.**

As in the preceding example, we reduce the calculation of dn $(.20|.81)$ to that of dn $\left(.19\,\middle|\,\frac{360}{361}\right)$, when

$$\mathrm{dn}\left(.19\,\middle|\,\frac{360}{361}\right)=.982267$$

$$\mathrm{dn}\,(.20|.81)=.984056$$

$$\mathrm{cn}\,(.20|.81)=.980278.$$

---

**Example 5.** Use the A.G.M. scale to compute dc $(.672|.36)$ to 4D.

From **16.9.6** we have $\mathrm{dc}^2(.672|.36)=.36+\frac{.64}{1-\mathrm{sn}^2(.672|.36)}$. We now calculate $\mathrm{sn}(.672|.36)$ by the method given in **16.4.** Form the A.G.M. scale

| $n$ | $a_n$ | $b_n$ | $c_n$ | $\frac{c_n}{a_n}$ | $\varphi_n$ | $\sin\varphi_n$ | $\sin(2\varphi_{n-1}-\varphi_n)$ | $2\varphi_{n-1}-\varphi_n$ |
|---|---|---|---|---|---|---|---|---|
| 0 | 1 | .8 | .6 | .6 | .65546 | .60952 | | |
| 1 | .9 | .89443 | .1 | .11111 | 1.2069 | .93452 | .10383 | .10402 |
| 2 | .89721 | .89721 | .00279 | .00311 | 2.4117 | .66679 | .00207 | .00207 |
| 3 | .89721 | .89721 | 0 | 0 | 4.8234 | −.99384 | 0 | 0 |

$\varphi_n=2^n a_n u \qquad \varphi_3=2^3(.89721)(.672)=4.8234$

continuing until $c_n=0$ to 5D.

Then complete as indicated in **16.4** to find $\varphi_0$ and so sn $u$ and hence dc $u$,

$\varphi_0=.65546 \qquad \mathrm{sn}\ u=.60952 \qquad \mathrm{dc}\ u=1.1740.$

**Example 6.** Use the A.G.M. scale to compute $\Theta(.6|.36)$ to 5D.

We use the method explained in **16.32** with $a_0=1$, $b_0=.8$, $c_0=.6$.

Computing the A.G.M. as explained in **17.6,** we find

(For values of $a_n$, $b_n$, $c_n$, see **Example 5.**)

| $n$ | $\varphi_n$ | $\sin\varphi_n$ | $\sin(2\varphi_{n-1}-\varphi_n)$ | $2\varphi_{n-1}-\varphi_n$ | $\sec(2\varphi_{n-1}-\varphi_n)$ | $\frac{1}{2^{n+1}}\ln\sec(2\varphi_{n-1}-\varphi_n)$ |
|---|---|---|---|---|---|---|
| 0 | .58803 | .55472 | | | | |
| 1 | 1.0780 | .88101 | .09789 | .09805 | 1.0048 | .00120 |
| 2 | 2.1533 | .83509 | .00260 | .00260 | 1. | 0 |
| 3 | 4.3066 | −.91879 | 0 | 0 | 1. | 0 |

and then complete the calculation outlined in **16.32** to give

$$\begin{aligned}\ln\Theta(u|m)&=-.05734+.02935+.00120\\&=-.02679\\\Theta(u|m)&=.97357.\end{aligned}$$

The series expansion for $\Theta$ is preferable.

**Example 7.** Use the $q$-series to compute cs (.53601 62|.09).

Here we use the series **16.23.12,** $K=1.60804\ 862$, $q=.00589\ 414$, $v=\frac{\pi u}{2K}=\frac{\pi}{6}$ radians or 30°.

Since $q^4$ is negligible to 8D, we have to 7D cs (.53601 62|.09)

$$=\frac{\pi}{2K}\cot 30°-\frac{2\pi}{K}\left\{\frac{q^2}{1+q^2}\sin 60°\right\}$$

$$=(.97683\ 3852)(1.73205\ 081)$$

$$-3.90733\ 541[(.00003\ 4740)(.86602\ 5404)]$$

$$=1.69180\ 83.$$

**Example 8.** Use theta functions to compute sn (.61802|.5) to 5D.

Here $K(\tfrac{1}{2})=1.85407$

$$\epsilon°=\frac{.61802}{1.85407}\times 90°=30°$$

$$\sin^2\alpha=1/2,\ \alpha=45°.$$

Thus

$$\text{sn }(.61802|.5)=\frac{\vartheta_s(30°\backslash 45°)}{\vartheta_n(30°\backslash 45°)}$$

$$=\frac{.59128}{1.04729}=.56458$$

from **Table 16.1.**

**Example 9.** Use theta functions to compute sc (.61802|.5) to 5D.

As in the preceding example

$$\epsilon°=30°,\ \alpha°=45°$$

so that

$$\text{sc }(.61802|.5)=\frac{\vartheta_s(30°\backslash 45°)}{\vartheta_c(30°\backslash 45°)}.$$

We use **Table 16.1** to give

$$\vartheta_s(30°\backslash 45°)=.59128$$

$$(\sec 45°)^{\frac{1}{2}}\vartheta_c(30°\backslash 45°)=1.02796.$$

Therefore

$$\text{sc }(.61802|.5)=\frac{.59128}{1.02796}(\sec 45°)^{\frac{1}{2}}$$

$$=.68402.$$

**Example 10.** Find sn (.75342|.7) by inverse interpolation in **Table 17.5.**

This method is explained in chapter **17, Example 7.**

**Example 11.** Find $u$, given that cs $(u|.5)=.75$. From **16.9.4** we have

$$\text{sn}^2\,u=\frac{1}{1+\text{cs}^2 u}.$$

Thus

$$\text{sn}^2\,(u|.5)=.64$$

and

$$\text{sn }(u|.5)=.8.$$

We have therefore replaced the problem by that of finding $u$ given sn $(u|m)$, where $m$ is known. If $\varphi=\text{am }u$

$$\sin\varphi=\text{sn }u \text{ and so}$$

$$\varphi=.9272952 \text{ radians or } 53.13010°.$$

From **Table 17.5,**

$$u=F(53.13010°\backslash 45°)=.99391.$$

Alternatively, starting with the above value of $\varphi$ we can use the A.G.M. scale to calculate $F(\varphi\backslash\alpha)$ as explained in **17.6.** This method is to be preferred if more figures are required, or if $\alpha$ differs from a tabular value in **Table 17.5.**

$\sqrt{\sec\alpha}\,\vartheta_c(\epsilon_1\backslash\alpha)$

$\epsilon^\circ=\frac{u}{K}\cdot 90^\circ$ $\quad\epsilon_1^\circ=90^\circ-\epsilon^\circ$ $\quad\alpha=\arcsin\sqrt{m}$ $\quad\vartheta_s(u|m)=\vartheta_s(\epsilon^\circ\backslash\alpha^\circ)$

In calculating elliptic functions from theta functions, when the modular angle exceeds about 60°, use the descending Landen transformation **16.12** to induce dependence on a smaller modular angle.

Compiled from E. P. Adams and R. L. Hippisley, Smithsonian mathematical formulae and tables of elliptic functions, 3d reprint (The Smithsonian Institution, Washington, D.C., 1957) (with permission).

$\sqrt{\sec\alpha}\,\vartheta_d(\epsilon_1\backslash\alpha)$

$\epsilon^\circ=\frac{u}{K}90^\circ$ $\quad\epsilon_1^\circ=90^\circ-\epsilon^\circ$ $\quad\alpha=\arcsin\sqrt{m}$ $\quad\vartheta_n(u|m)=\vartheta_n(\epsilon^\circ\backslash\alpha^\circ)$

In calculating elliptic functions from theta functions, when the modular angle exceeds about 60°, use the descending Landen transformation **16.12** to induce dependence on a smaller modular angle.

**Table 16.2** LOGARITHMIC DERIVATIVES OF THETA FUNCTIONS

$$\frac{d}{du}\ln\vartheta_s(u)=f(\epsilon\backslash\alpha)$$

# 17. Elliptic Integrals

## Mathematical Properties

### 17.1. Definition of Elliptic Integrals

If $R(x, y)$ is a rational function of $x$ and $y$, where $y^2$ is equal to a cubic or quartic polynomial in $x$, the integral

**17.1.1**
$$\int R(x,y)dx$$

is called an *elliptic integral.*

The elliptic integral just defined can not, in general, be expressed in terms of elementary functions.

Exceptions to this are

(i) when $R(x, y)$ contains no odd powers of $y$.
(ii) when the polynomial $y^2$ has a repeated factor.

We therefore exclude these cases.

By substituting for $y^2$ and denoting by $p_s(x)$ a polynomial in $x$ we get [2]

$$R(x,y)=\frac{p_1(x)+yp_2(x)}{p_3(x)+yp_4(x)}$$
$$=\frac{[p_1(x)+yp_2(x)][p_3(x)-yp_4(x)]y}{\{[p_3(x)]^2-y^2[p_4(x)]^2\}y}$$
$$=\frac{p_5(x)+yp_6(x)}{yp_7(x)}=R_1(x)+\frac{R_2(x)}{y}$$

where $R_1(x)$ and $R_2(x)$ are rational functions of $x$. Hence, by expressing $R_2(x)$ as the sum of a polynomial and partial fractions

$$\int R(x,y)dx=\int R_1(x)dx+\Sigma_s A_s\int x^s y^{-1}dx$$
$$+\Sigma_s B_s\int [(x-c)^s y]^{-1}dx$$

#### Reduction Formulae

Let

**17.1.2**

$$y^2=a_0x^4+a_1x^3+a_2x^2+a_3x+a_4 \qquad (|a_0|+|a_1|\neq 0)$$
$$=b_0(x-c)^4+b_1(x-c)^3+b_2(x-c)^2+b_3(x-c)+b_4 \qquad (|b_0|+|b_1|\neq 0)$$

**17.1.3** $$I_s=\int x^s y^{-1}dx,\ J_s=\int [y(x-c)^s]^{-1}dx$$

By integrating the derivatives of $yx^s$ and $y(x-c)^{-s}$ we get the reduction formulae

**17.1.4**

$$(s+2)a_0I_{s+3}+\tfrac{1}{2}a_1(2s+3)I_{s+2}+a_2(s+1)I_{s+1}$$
$$+\tfrac{1}{2}a_3(2s+1)I_s+sa_4I_{s-1}=x^sy \quad (s=0, 1, 2, \ldots)$$

**17.1.5**

$$(2-s)b_0J_{s-3}+\tfrac{1}{2}b_1(3-2s)J_{s-2}+b_2(1-s)J_{s-1}$$
$$+\tfrac{1}{2}b_3(1-2s)J_s-sb_4J_{s+1}=y(x-c)^{-s}$$
$$(s=1, 2, 3, \ldots)$$

By means of these reduction formulae and certain transformations (see **Examples 1** and **2**) every elliptic integral can be brought to depend on the integral of a rational function and on three canonical forms for elliptic integrals.

### 17.2. Canonical Forms

#### Definitions

**17.2.1**

$m=\sin^2\alpha$; $m$ is the parameter,
$\alpha$ is the modular angle

**17.2.2** $$x=\sin\varphi=\operatorname{sn}u$$

**17.2.3** $$\cos\varphi=\operatorname{cn}u$$

**17.2.4**

$(1-m\sin^2\varphi)^{\frac{1}{2}}=\operatorname{dn}u=\Delta(\varphi)$, the delta amplitude

**17.2.5** $\varphi=\arcsin(\operatorname{sn}u)=\operatorname{am}u$, the amplitude

#### Elliptic Integral of the First Kind

**17.2.6** $$F(\varphi\backslash\alpha)=F(\varphi|m)=\int_0^{\varphi}(1-\sin^2\alpha\sin^2\theta)^{-\frac{1}{2}}d\theta$$

**17.2.7** $$=\int_0^x[(1-t^2)(1-mt^2)]^{-\frac{1}{2}}dt$$
$$=\int_0^u dw=u$$

#### Elliptic Integral of the Second Kind

**17.2.8** $$E(\varphi\backslash\alpha)=E(u|m)=\int_0^x(1-t^2)^{-\frac{1}{2}}(1-mt^2)^{\frac{1}{2}}dt$$

**17.2.9** $$=\int_0^{\varphi}(1-\sin^2\alpha\sin^2\theta)^{\frac{1}{2}}d\theta$$

**17.2.10** $$=\int_0^u \operatorname{dn}^2 w\,dw$$

**17.2.11** $$=m_1u+m\int_0^u \operatorname{cn}^2 w\,dw$$

---

[2] See [17.7] 22.72.

**17.2.12** $$E(\varphi\backslash\alpha)=u-m\int_0^u \mathrm{sn}^2 w\,dw$$

**17.2.13** $$=\frac{\pi}{2K(m)}\frac{\vartheta_4'(\pi u/2K)}{\vartheta_4(\pi u/2K)}+\frac{E(m)u}{K(m)}$$

(For theta functions, see chapter **16.**)

### Elliptic Integral of the Third Kind

**17.2.14**

$$\Pi(n;\varphi\backslash\alpha)=\int_0^\varphi (1-n\sin^2\theta)^{-1}\,[1-\sin^2\alpha\sin^2\theta]^{-1/2}d\theta$$

If $x=\mathrm{sn}\,(u|m)$,

**17.2.15**

$$\Pi(n;u|m)=\int_0^x (1-nt^2)^{-1}[(1-t^2)(1-mt^2)]^{-1/2}dt$$

**17.2.16** $$=\int_0^u (1-n\,\mathrm{sn}^2\,(w|m))^{-1}dw$$

### The Amplitude $\varphi$

**17.2.17** $\varphi=\mathrm{am}\,u=\arcsin\,(\mathrm{sn}\,u)=\arcsin\,x$

can be calculated from **Tables 17.5** and **4.14.**

### The Parameter $m$

Dependence on the *parameter* $m$ is denoted by a vertical stroke preceding the parameter, e.g., $F(\varphi|m)$.

Together with the parameter we define the *complementary parameter* $m_1$ by

**17.2.18** $$m+m_1=1$$

When the parameter is real, it can always be arranged, see **17.4,** that $0\leq m\leq 1$.

### The Modular Angle $\alpha$

Dependence on the modular angle $\alpha$, defined in terms of the parameter by **17.2.1,** is denoted by a backward stroke $\backslash$ preceding the modular angle, thus $E(\varphi\backslash\alpha)$. The *complementary modular* angle is $\pi/2-\alpha$ or $90°-\alpha$ according to the unit and thus $m_1=\sin^2\,(90°-\alpha)=\cos^2\,\alpha$.

### The Modulus $k$

In terms of Jacobian elliptic functions (chapter **16**), the modulus $k$ and the complementary modulus are defined by

**17.2.19** $k=\mathrm{ns}\,(K+iK')$, $k'=\mathrm{dn}\,K$.

They are related to the parameter by $k^2=m$, $k'^2=m_1$.

Dependence on the modulus is denoted by a comma preceding it, thus $\Pi(n;u,k)$.

In computation the modulus is of minimal importance, since it is the parameter and its complement which arise naturally. The parameter and the modular angle will be employed in this chapter to the exclusion of the modulus.

### The Characteristic $n$

The elliptic integral of the third kind depends on three variables namely (i) the parameter, (ii) the amplitude, (iii) the characteristic $n$. When real, the characteristic may be any number in the interval $(-\infty,\infty)$. The properties of the integral depend upon the location of the characteristic in this interval, see **17.7.**

## 17.3. Complete Elliptic Integrals of the First and Second Kinds

Referred to the canonical forms of **17.2,** the elliptic integrals are said to be *complete* when the amplitude is $\frac{1}{2}\pi$ and so $x=1$. These complete integrals are designated as follows

**17.3.1**

$$[K(m)]=K=\int_0^1[(1-t^2)(1-mt^2)]^{-1/2}dt$$
$$=\int_0^{\pi/2}(1-m\sin^2\theta)^{-1/2}d\theta$$

**17.3.2** $$K=F(\tfrac{1}{2}\pi|m)=F(\tfrac{1}{2}\pi\backslash\alpha)$$

**17.3.3**

$$E[K(m)]=E=\int_0^1(1-t^2)^{-1/2}(1-mt^2)^{1/2}dt$$
$$=\int_0^{\pi/2}(1-m\sin^2\theta)^{1/2}d\theta$$

**17.3.4** $$E=E[K(m)]=E(m)=E(\tfrac{1}{2}\pi\backslash\alpha)$$

We also define

**17.3.5**

$$K'=K(m_1)=K(1-m)=\int_0^{\pi/2}(1-m_1\sin^2\theta)^{-1/2}d\theta$$

**17.3.6** $$K'=F(\tfrac{1}{2}\pi|m_1)=F(\tfrac{1}{2}\pi\backslash\tfrac{1}{2}\pi-\alpha)$$

**17.3.7**

$$E'=E(m_1)=E(1-m)=\int_0^{\pi/2}(1-m_1\sin^2\theta)^{1/2}d\theta$$

**17.3.8** $$E'=E[K(m_1)]=E(m_1)=E(\tfrac{1}{2}\pi\backslash\tfrac{1}{2}\pi-\alpha)$$

$K$ and $iK'$ are the "real" and "imaginary" *quarter-periods* of the corresponding Jacobian elliptic functions (see chapter **16**).

### Relation to the Hypergeometric Function
(see chapter 15)

**17.3.9** $$K=\tfrac{1}{2}\pi F(\tfrac{1}{2},\tfrac{1}{2};1;m)$$

**17.3.10** $$E=\tfrac{1}{2}\pi F(-\tfrac{1}{2},\tfrac{1}{2};1;m)$$

### Infinite Series

**17.3.11**

$$K(m)=\frac{1}{2}\pi\left[1+\left(\frac{1}{2}\right)^2 m+\left(\frac{1\cdot 3}{2\cdot 4}\right)^2 m^2+\left(\frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\right)^2 m^3+\ldots\right]\qquad(|m|<1)$$

**17.3.12**

$$E(m)=\frac{1}{2}\pi\left[1-\left(\frac{1}{2}\right)^2\frac{m}{1}-\left(\frac{1\cdot 3}{2\cdot 4}\right)^2\frac{m^2}{3}-\left(\frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\right)^2\frac{m^3}{5}-\ldots\right]\qquad(|m|<1)$$

### Legendre's Relation

**17.3.13** $$EK'+E'K-KK'=\tfrac{1}{2}\pi$$

### Auxiliary Function

**17.3.14** $$L(m)=\frac{K'(m)}{\pi}\ln\frac{16}{m_1}-K(m)$$

**17.3.15** $$m=1-16\exp\left[-\pi(K(m)+L(m))/K'(m)\right]$$

**17.3.16** $$m=16\exp\left[-\pi(K'(m)+L(m_1))/K(m)\right]$$

The function $L(m)$ is tabulated in **Table 17.4.**

### $q$-Series

The Nome $q$ and the Complementary Nome $q_1$

**17.3.17** $$q=q(m)=\exp\left[-\pi K'/K\right]$$

**17.3.18** $$q_1=q(m_1)=\exp\left[-\pi K/K'\right]$$

**17.3.19** $$\ln\frac{1}{q}\ln\frac{1}{q_1}=\pi^2$$

**17.3.20**

$$\log_{10}\frac{1}{q}\log_{10}\frac{1}{q_1}=(\pi\log_{10}e)^2=1.86152\ 28349 \text{ to 10D}$$

**17.3.21**

$$q=\exp\left[-\pi K'/K\right]=\frac{m}{16}+8\left(\frac{m}{16}\right)^2+84\left(\frac{m}{16}\right)^3+992\left(\frac{m}{16}\right)^4+\ldots\qquad(|m|<1)$$

**17.3.22** $$K=\frac{1}{2}\pi+2\pi\sum_{s=1}^{\infty}\frac{q^s}{1+q^{2s}}$$

**17.3.23**

$$\frac{E}{K}=\frac{1}{3}(1+m_1)+(\pi/K)^2\left[1/12-2\sum_{s=1}^{\infty}q^{2s}(1-q^{2s})^{-2}\right]$$

**17.3.24** $$\text{am}\,u=v+\sum_{s=1}^{\infty}\frac{2q^s\sin 2sv}{s(1+q^{2s})}\text{ where } v=\pi u/(2K)$$

### Limiting Values

**17.3.25** $$\lim_{m\to 0}K'(E-K)=0$$

**17.3.26** $$\lim_{m\to 1}\left[K-\tfrac{1}{2}\ln(16/m_1)\right]=0$$

**17.3.27** $$\lim_{m\to 0}m^{-1}(K-E)=\lim_{m\to 0}m^{-1}(E-m_1K)=\pi/4$$

**17.3.28** $$\lim_{m\to 0}q/m=\lim_{m_1\to 1}q_1/m_1=1/16$$

### Alternative Evaluations of $K$ and $E$ (see also 17.5)

**17.3.29**

$$K(m)=2[1+m_1^{1/2}]^{-1}K([(1-m_1^{1/2})/(1+m_1^{1/2})]^2)^{*}$$

**17.3.30**

$$E(m)=(1+m_1^{1/2})E([(1-m_1^{1/2})/(1+m_1^{1/2})]^2)-2m_1^{1/2}(1+m_1^{1/2})^{-1}K([(1-m_1^{1/2})/(1+m_1^{1/2})]^2)$$

**17.3.31** $$K(\alpha)=2F(\arctan(\sec^{1/2}\alpha)\backslash\alpha)$$

**17.3.32** $$E(\alpha)=2E(\arctan(\sec^{1/2}\alpha)\backslash\alpha)-1+\cos\alpha$$

### Polynomial Approximations[3] $(0\leq m<1)$

**17.3.33**

$$K(m)=[a_0+a_1m_1+a_2m_1^2]+[b_0+b_1m_1+b_2m_1^2]\ln(1/m_1)+\epsilon(m)$$

$$|\epsilon(m)|\leq 3\times 10^{-5}$$

| | |
|---|---|
| $a_0=1.38629\ 44$ | $b_0=.5$ |
| $a_1=.11197\ 23$ | $b_1=.12134\ 78$ |
| $a_2=.07252\ 96$ | $b_2=.02887\ 29$ |

**17.3.34**

$$K(m)=[a_0+a_1m_1+\ldots+a_4m_1^4]+[b_0+b_1m_1+\ldots+b_4m_1^4]\ln(1/m_1)+\epsilon(m)$$

$$|\epsilon(m)|\leq 2\times 10^{-8}$$

| | |
|---|---|
| $a_0=1.38629\ 436112$ | $b_0=.5$ |
| $a_1=.09666\ 344259$ | $b_1=.12498\ 593597$ |
| $a_2=.03590\ 092383$ | $b_2=.06880\ 248576$ |
| $a_3=.03742\ 563713$ | $b_3=.03328\ 355346$ |
| $a_4=.01451\ 196212$ | $b_4=.00441\ 787012$ |

---

## 17.4. Incomplete Elliptic Integrals of the First and Second Kinds

### Extension of the Tables

**Negative Amplitude**

**17.4.1** $F(-\varphi|m)=-F(\varphi|m)$

**17.4.2** $E(-\varphi|m)=-E(\varphi|m)$

**Amplitude of Any Magnitude**

**17.4.3** $F(s\pi\pm\varphi|m)=2sK\pm F(\varphi|m)$

**17.4.4** $E(u+2K)=E(u)+2E$

**17.4.5** $E(u+2iK')=E(u)+2i(K'-E')$

**17.4.6**

$$E(u+2mK+2niK')=E(u)+2mE+2ni(K'-E')$$

**17.4.7** $E(K-u)=E-E(u)+m\,\mathrm{sn}\,u\,\mathrm{cd}\,u$

**Imaginary Amplitude**

If $\tan\theta=\sinh\varphi$

**17.4.8** $F(i\varphi\backslash\alpha)=iF(\theta\backslash\tfrac{1}{2}\pi-\alpha)$

**17.4.9**

$$E(i\varphi\backslash\alpha)=-iE(\theta\backslash\tfrac{1}{2}\pi-\alpha)+iF(\theta\backslash\tfrac{1}{2}\pi-\alpha)+i\tan\theta(1-\cos^2\alpha\sin^2\theta)^{\frac{1}{2}}$$

**Jacobi's Imaginary Transformation**

**17.4.10**

$$E(iu|m)=i[u+\mathrm{dn}(u|m_1)\mathrm{sc}(u|m_1)-E(u|m_1)]$$

**Complex Amplitude**

**17.4.11** $F(\varphi+i\psi|m)=F(\lambda|m)+iF(\mu|m_1)$

where $\cot^2\lambda$ is the positive root of the equation $x^2-[\cot^2\varphi+m\sinh^2\psi\csc^2\varphi-m_1]x-m_1\cot^2\varphi=0$ and $m\tan^2\mu=\tan^2\varphi\cot^2\lambda-1$.

**17.4.12**

$$E(\varphi+i\psi\backslash\alpha)=E(\lambda\backslash\alpha)-iE(\mu\backslash 90^\circ-\alpha)+iF(\mu\backslash 90^\circ-\alpha)+\frac{b_1+ib_2}{b_3}$$

where

$$b_1=\sin^2\alpha\sin\lambda\cos\lambda\sin^2\mu(1-\sin^2\alpha\sin^2\lambda)^{\frac{1}{2}}$$

$$b_2=(1-\sin^2\alpha\sin^2\lambda)(1-\cos^2\alpha\sin^2\mu)^{\frac{1}{2}}\sin\mu\cos\mu$$

$$b_3=\cos^2\mu+\sin^2\alpha\sin^2\lambda\sin^2\mu$$

### Amplitude Near to $\pi/2$ (see also 17.5)

If $\cos\alpha\tan\varphi\tan\psi=1$

**17.4.13** $F(\varphi\backslash\alpha)+F(\psi\backslash\alpha)=F(\pi/2\backslash\alpha)=K$

**17.4.14**

$$E(\varphi\backslash\alpha)+E(\psi\backslash\alpha)=E(\pi/2\backslash\alpha)+\sin^2\alpha\sin\varphi\sin\psi$$

Values when $\varphi$ is near to $\pi/2$ and $m$ is near to unity can be calculated by these formulae.

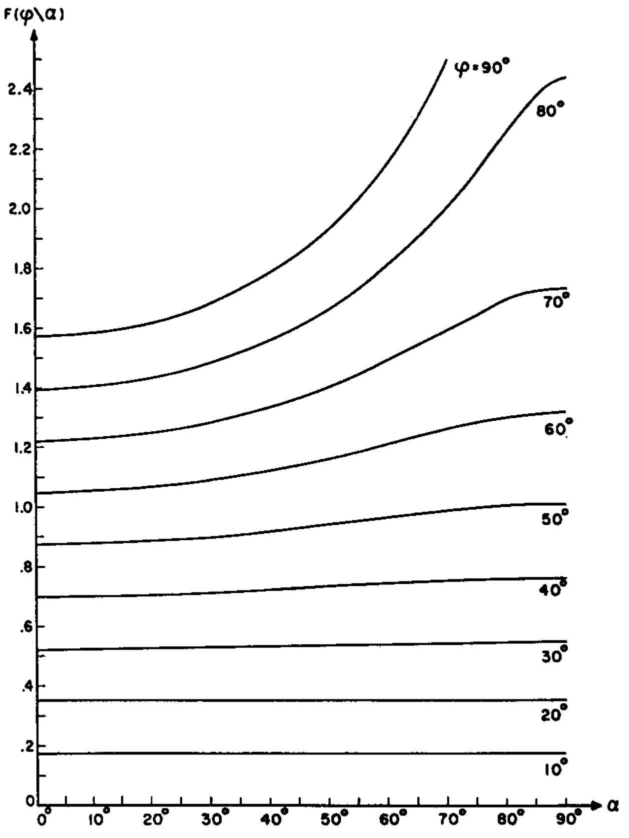

FIGURE 17.3. *Incomplete elliptic integral of the first kind.*

$F(\varphi\backslash\alpha)$, $\varphi$ constant

### Parameter Greater Than Unity

**17.4.15** $F(\varphi|m)=m^{-\frac{1}{2}}F(\theta|m^{-1})$, $\sin\theta=m^{\frac{1}{2}}\sin\varphi$

**17.4.16** $E(u|m)=m^{\frac{1}{2}}E(um^{\frac{1}{2}}|m^{-1})-(m-1)u$

by which a parameter greater than unity can be replaced by a parameter less than unity.

### Negative Parameter

**17.4.17**

$$F(\varphi|-m)=(1+m)^{-\frac{1}{2}}K(m(1+m)^{-1})-(1+m)^{-\frac{1}{2}}F\left(\frac{\pi}{2}-\varphi\,|\,m(1+m)^{-1}\right)$$

**17.4.18**

$$E(u|-m)=(1+m)^{\frac{1}{2}}\{E(u(1+m)^{\frac{1}{2}}|m(m+1)^{-1})-m(1+m)^{-\frac{1}{2}}\operatorname{sn}(u(1+m)^{\frac{1}{2}}|m(1+m)^{-1})\operatorname{cd}(u(1+m)^{\frac{1}{2}}|m(1+m)^{-1})\}$$

whereby computations can be made for negative parameters, and therefore for pure imaginary modulus.

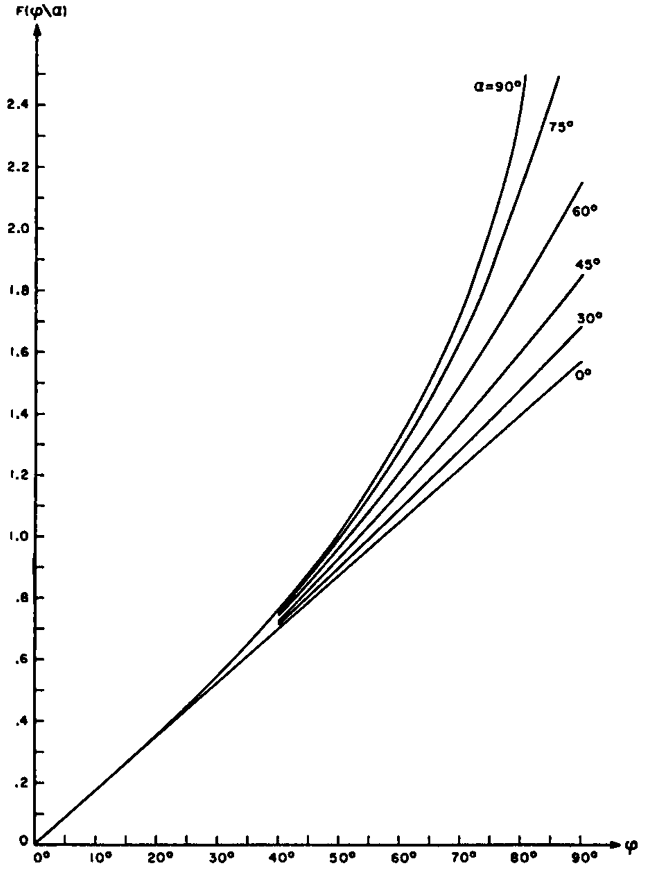

FIGURE 17.4. *Incomplete elliptic integral of the first kind.*

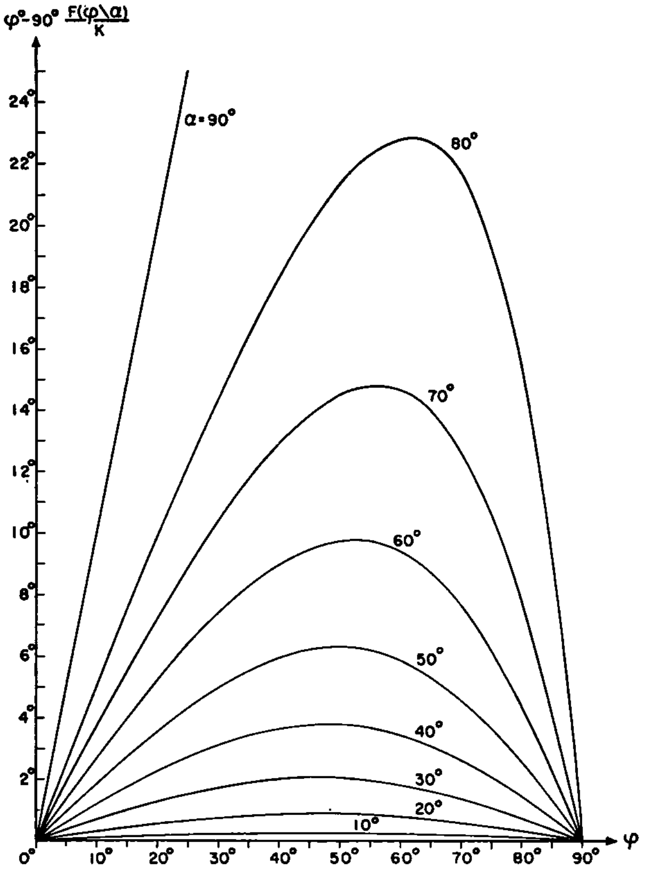

FIGURE 17.5. $\varphi - 90° \frac{F(\varphi\backslash\alpha)}{K}$, *α constant.*

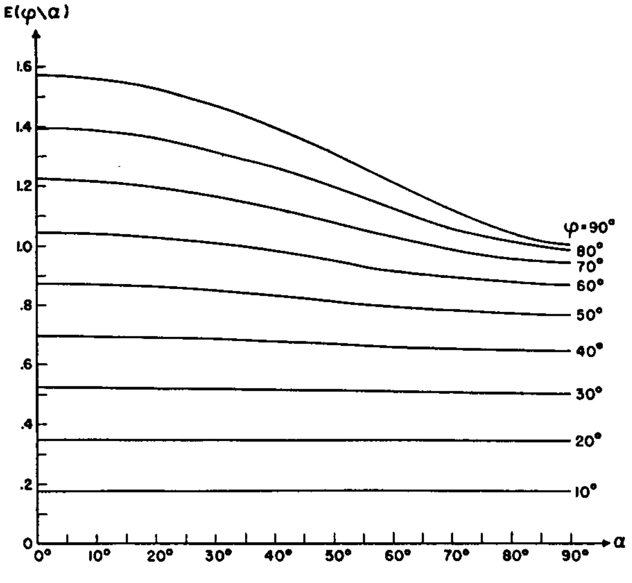

FIGURE 17.6. *Incomplete elliptic integral of the second kind.*

$E(\varphi\backslash\alpha)$, φ constant

**Special Cases**

**17.4.19** $$F(\varphi\backslash 0)=\varphi$$

**17.4.20** $$F(i\varphi\backslash 0)=i\varphi$$

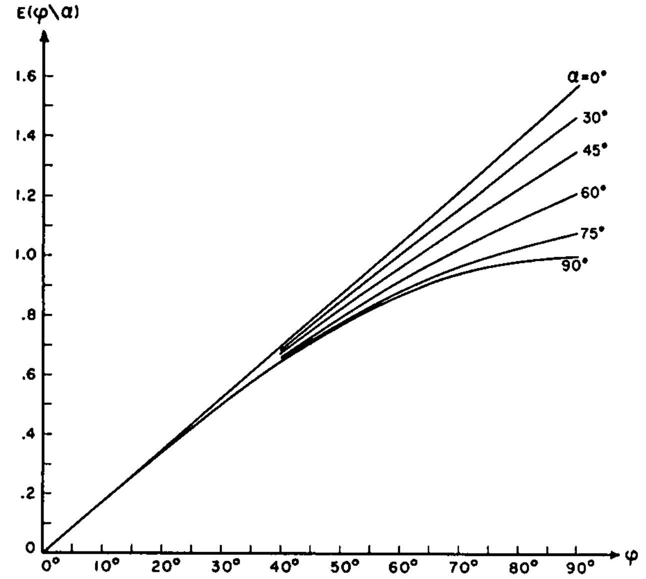

FIGURE 17.7. *Incomplete elliptic integral of the second kind.*

$E(\varphi\backslash\alpha)$, α constant

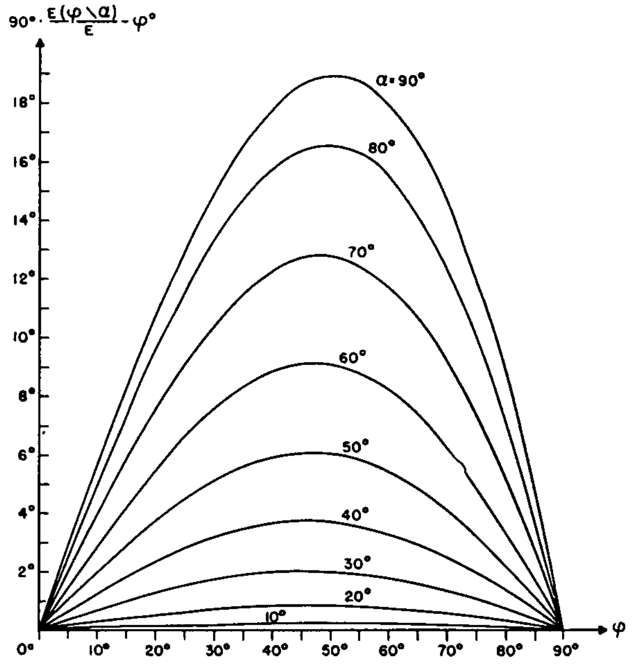

FIGURE 17.8. $90° \frac{E(\varphi\backslash\alpha)}{E}-\varphi$, *α constant.*

**17.4.21**

$$F(\varphi\backslash 90°)=\ln(\sec\varphi+\tan\varphi)=\ln\tan\left(\frac{\pi}{4}+\frac{\varphi}{2}\right)$$

**17.4.22** $$F(i\varphi\backslash 90°)=i\arctan(\sinh\varphi)$$

**17.4.23** $$E(\varphi\backslash 0)=\varphi$$

**17.4.24** $$E(i\varphi\backslash 0)=i\varphi$$

**17.4.25** $$E(\varphi\backslash 90°)=\sin\varphi$$

**17.4.26** $$E(i\varphi\backslash 90°)=i\sinh\varphi$$

### Jacobi's Zeta Function

**17.4.27** $Z(\varphi\backslash\alpha)=E(\varphi\backslash\alpha)-E(\alpha)F(\varphi\backslash\alpha)/K(\alpha)$

**17.4.28** $Z(u|m)=Z(u)=E(u)-uE(m)/K(m)$

**17.4.29** $Z(-u)=-Z(u)$

**17.4.30** $Z(u+2K)=Z(u)$

**17.4.31** $Z(K-u)=-Z(K+u)$

**17.4.32** $Z(u)=Z(u-K)-m\operatorname{sn}(u-K)\operatorname{cd}(u-K)$

### Special Values

**17.4.33** $Z(u|0)=0$

**17.4.34** $Z(u|1)=\tanh u$

### Addition Theorem

**17.4.35**

$$Z(u+v)=Z(u)+Z(v)-m\operatorname{sn} u \operatorname{sn} v \operatorname{sn}(u+v)$$

### Jacobi's Imaginary Transformation

**17.4.36**

$$iZ(iu|m)=Z(u|m_1)+\frac{\pi u}{2KK'}-\operatorname{dn}(u|m_1)\operatorname{sc}(u|m_1)$$

### Relation to Jacobi's Theta Function

**17.4.37** $Z(u)=\Theta'(u)/\Theta(u)=\frac{d}{du}\ln\Theta(u)$

### $q$-Series

**17.4.38** $Z(u)=\frac{2\pi}{K}\sum_{s=1}^{\infty} q^s(1-q^{2s})^{-1}\sin(\pi s u/K)$

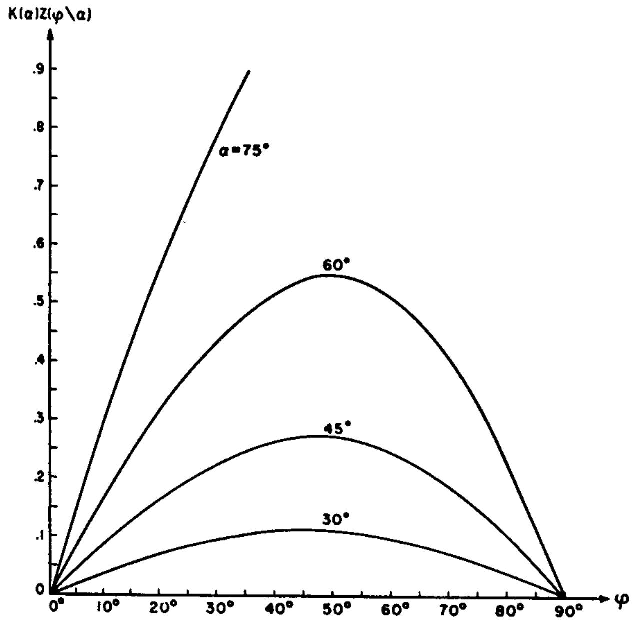

FIGURE 17.9. *Jacobian zeta function* $K(\alpha)Z(\varphi\backslash\alpha)$.

### Heuman's Lambda Function

**17.4.39**

$$\Lambda_0(\varphi\backslash\alpha)=\frac{F(\varphi\backslash 90^\circ-\alpha)}{K'(\alpha)}+\frac{2}{\pi}K(\alpha)Z(\varphi\backslash 90^\circ-\alpha)$$

**17.4.40**

$$=\frac{2}{\pi}\{K(\alpha)E(\varphi\backslash 90^\circ-\alpha)-[K(\alpha)-E(\alpha)]F(\varphi\backslash 90^\circ-\alpha)\}$$

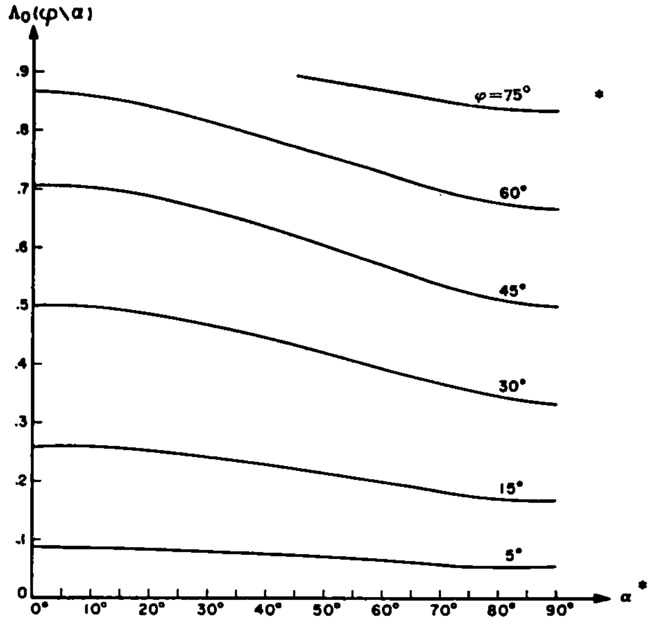

FIGURE 17.10. *Heuman's lambda function* $\Lambda_0(\varphi\backslash\alpha)$.

### Numerical Evaluation of Incomplete Integrals of the First and Second Kinds

For the numerical evaluation of an elliptic integral the quartic (or cubic [4]) under the radical should first be expressed in terms of $t^2$, see **Examples 1 and 2.** In the resulting quartic there are only six possible sign patterns or combinations of the factors namely

$$(t^2+a^2)(t^2+b^2),\quad (a^2-t^2)(t^2-b^2),$$
$$(a^2-t^2)(b^2-t^2),\quad (t^2-a^2)(t^2-b^2),\quad (t^2+a^2)(t^2-b^2),$$
$$(t^2+a^2)(b^2-t^2).$$

The list which follows is then exhaustive for integrals which reduce to $F(\varphi\backslash\alpha)$ or $E(\varphi\backslash\alpha)$.

The value of the elliptic integral of the first kind is also expressed as an *inverse* Jacobian elliptic function. Here, for example, the notation $u=\operatorname{sn}^{-1}x$ means that $x=\operatorname{sn} u$.

The column headed "$t$ substitution" gives the Jacobian elliptic function substitution which is appropriate to reduce every elliptic integral which contains the given quartic.

---

*See page II.

## 17.5. Landen's Transformation

### Descending Landen Transformation [5]

Let $\alpha_n$, $\alpha_{n+1}$ be two modular angles such that

**17.5.1** $$(1+\sin\alpha_{n+1})(1+\cos\alpha_n)=2\qquad(\alpha_{n+1}<\alpha_n)$$

and let $\varphi_n$, $\varphi_{n+1}$ be two corresponding amplitudes such that

**17.5.2** $$\tan(\varphi_{n+1}-\varphi_n)=\cos\alpha_n\tan\varphi_n\qquad(\varphi_{n+1}>\varphi_n)$$

---

[5] The emphasis here is on the modular angle since this is an argument of the Tables. All formulae concerning Landen's transformation may also be expressed in terms of the modulus $k=m^{\frac{1}{2}}=\sin\alpha$ and its complement $k'=m_1^{\frac{1}{2}}=\cos\alpha$.

*See page II.

Thus the step from $n$ to $n+1$ decreases the modular angle but increases the amplitude. By iterating the process we can descend from a given modular angle to one whose magnitude is negligible, when **17.4.19** becomes applicable.

With $\alpha_0=\alpha$ we have

**17.5.3**

$$F(\varphi\backslash\alpha)=(1+\cos\alpha)^{-1}F(\varphi_1\backslash\alpha_1)$$
$$=\tfrac{1}{2}(1+\sin\alpha_1)F(\varphi_1\backslash\alpha_1)$$

**17.5.4** $$F(\varphi\backslash\alpha)=2^{-n}\prod_{s=1}^{n}(1+\sin\alpha_s)F(\varphi_n\backslash\alpha_n)$$

**17.5.5** $$F(\varphi\backslash\alpha)=\Phi\prod_{s=1}^{\infty}(1+\sin\alpha_s)$$

**17.5.6** $$\Phi=\lim_{n\to\infty}\frac{1}{2^n}F(\varphi_n\backslash\alpha_n)=\lim_{n\to\infty}\frac{\varphi_n}{2^n}$$

**17.5.7** $$K=F(\tfrac{1}{2}\pi\backslash\alpha)=\tfrac{1}{2}\pi\prod_{s=1}^{\infty}(1+\sin\alpha_s)$$

**17.5.8** $$F(\varphi\backslash\alpha)=2\pi^{-1}K\Phi$$

**17.5.9**

$$E(\varphi\backslash\alpha)=F(\varphi\backslash\alpha)\left[1-\frac{1}{2}\sin^2\alpha\left(1+\frac{1}{2}\sin\alpha_1\right.\right.$$
$$\left.\left.+\frac{1}{2^2}\sin\alpha_1\sin\alpha_2+\ldots\right)\right]+\sin\alpha\left[\frac{1}{2}(\sin\alpha_1)^{1/2}\sin\varphi_1\right.$$
$$\left.+\frac{1}{2^2}(\sin\alpha_1\sin\alpha_2)^{1/2}\sin\varphi_2+\ldots\right]$$

**17.5.10**

$$E=K\left[1-\frac{1}{2}\sin^2\alpha\left(1+\frac{1}{2}\sin\alpha_1+\frac{1}{2^2}\sin\alpha_1\sin\alpha_2\right.\right.$$
$$\left.\left.+\frac{1}{2^3}\sin\alpha_1\sin\alpha_2\sin\alpha_3+\ldots\right)\right]$$

### Ascending Landen Transformation

Let $\alpha_n$, $\alpha_{n+1}$ be two modular angles such that

**17.5.11** $$(1+\sin\alpha_n)(1+\cos\alpha_{n+1})=2\qquad(\alpha_{n+1}>\alpha_n)$$

and let $\varphi_n$, $\varphi_{n+1}$ be two corresponding amplitudes such that

**17.5.12** $$\sin(2\varphi_{n+1}-\varphi_n)=\sin\alpha_n\sin\varphi_n\qquad(\varphi_{n+1}<\varphi_n)$$

Thus the step from $n$ to $n+1$ increases the modular angle but decreases the amplitude. By iterating the process we can ascend from a given modular angle to one whose difference from a right angle is so small that **17.4.21** becomes applicable.

With $\alpha_0=\alpha$ we have

**17.5.13** $$F(\varphi\backslash\alpha)=2(1+\sin\alpha)^{-1}F(\varphi_1\backslash\alpha_1)$$

**17.5.14** $$F(\varphi\backslash\alpha)=2^n\prod_{s=0}^{n-1}(1+\sin\alpha_s)^{-1}F(\varphi_n\backslash\alpha_n)$$

**17.5.15** $$F(\varphi\backslash\alpha)=\prod_{s=1}^{n}(1+\cos\alpha_s)F(\varphi_n\backslash\alpha_n)$$

**17.5.16** $$F(\varphi\backslash\alpha)=\left[\csc\alpha\prod_{s=1}^{\infty}\sin\alpha_s\right]^{\frac{1}{2}}\ln\tan\left(\tfrac{1}{4}\pi+\tfrac{1}{2}\Phi\right)$$

**17.5.17** $$\Phi=\lim_{n\to\infty}\varphi_n$$

### Neighborhood of a Right Angle (see also 17.4.13)

When both $\varphi$ and $\alpha$ are near to a right angle, interpolation in the table $F(\varphi\backslash\alpha)$ is difficult. Either Landen's transformation can then be used with advantage to increase the modular angle and decrease the amplitude or vice-versa.

## 17.6. The Process of the Arithmetic-Geometric Mean

Starting with a given number triple $(a_0, b_0, c_0)$ we proceed to determine number triples $(a_1, b_1, c_1)$, $(a_2, b_2, c_2)$, . . ., $(a_N, b_N, c_N)$ according to the following scheme of arithmetic and geometric means

**17.6.1**

$$\begin{array}{ll}
a_0 & b_0 \\
a_1=\tfrac{1}{2}(a_0+b_0) & b_1=(a_0b_0)^{\frac{1}{2}} \\
a_2=\tfrac{1}{2}(a_1+b_1) & b_2=(a_1b_1)^{\frac{1}{2}} \\
\vdots & \vdots \\
a_N=\tfrac{1}{2}(a_{N-1}+b_{N-1}) & b_N=(a_{N-1}b_{N-1})^{\frac{1}{2}}
\end{array}$$

$$\begin{array}{l}
c_0 \\
c_1=\tfrac{1}{2}(a_0-b_0) \\
c_2=\tfrac{1}{2}(a_1-b_1) \\
\vdots \\
c_N=\tfrac{1}{2}(a_{N-1}-b_{N-1}).
\end{array}$$

We stop at the $N$th step when $a_N=b_N$, i.e., when $c_N=0$ to the degree of accuracy to which the numbers are required.

To determine the complete elliptic integrals $K(\alpha)$, $E(\alpha)$ we start with

**17.6.2** $$a_0=1,\ b_0=\cos\alpha,\ c_0=\sin\alpha$$

whence

**17.6.3** $$K(\alpha)=\frac{\pi}{2a_N}$$

**17.6.4** $$\frac{K(\alpha)-E(\alpha)}{K(\alpha)}=\frac{1}{2}\,[c_0^2+2c_1^2+2^2c_2^2+\ .\ .\ .\ +2^Nc_N^2]$$

To determine $K'(\alpha)$, $E'(\alpha)$ we start with

**17.6.5** $$a_0'=1,\ b_0'=\sin\alpha,\ c_0'=\cos\alpha$$

whence

**17.6.6** $$K'(\alpha)=\frac{\pi}{2a_N'}$$

**17.6.7**

$$\frac{K'(\alpha)-E'(\alpha)}{K'(\alpha)}=\frac{1}{2}\,[c_0'^2+2c_1'^2+2^2c_2'^2+\ .\ .\ .\ +2^Nc_N'^2]$$

To calculate $F(\varphi\backslash\alpha)$, $E(\varphi\backslash\alpha)$ start from **17.5.2** which corresponds to the descending Landen transformation and determine $\varphi_1,\ \varphi_2,\ .\ .\ .,\ \varphi_N$ successively from the relation

**17.6.8** $$\tan\,(\varphi_{n+1}-\varphi_n)=(b_n/a_n)\tan\varphi_n,\ \varphi_0=\varphi$$

Then to the prescribed accuracy

**17.6.9** $$F(\varphi\backslash\alpha)=\varphi_N/(2^Na_N)\quad *$$

**17.6.10**

$$Z(\varphi\backslash\alpha)=E(\varphi\backslash\alpha)-(E/K)F(\varphi\backslash\alpha)$$

$$*\qquad =c_1\sin\varphi_1+c_2\sin\varphi_2+\ .\ .\ .\ +c_N\sin\varphi_N$$

## 17.7. Elliptic Integrals of the Third Kind

**17.7.1**

$$\Pi(n;\,\varphi\backslash\alpha)=\int_0^{\varphi}(1-n\sin^2\theta)^{-1}(1-\sin^2\alpha\sin^2\theta)^{-\frac{1}{2}}d\theta$$

**17.7.2** $$\Pi\,(n;\tfrac{1}{2}\pi\backslash\alpha)=\Pi\,(n\backslash\alpha)$$

**Case (i) Hyperbolic Case $0<n<\sin^2\alpha$**

$$\epsilon=\arcsin\,(n/\sin^2\alpha)^{\frac{1}{2}},\qquad 0\leq\epsilon\leq\tfrac{1}{2}\pi$$

$$\beta=\tfrac{1}{2}\pi F(\epsilon\backslash\alpha)/K(\alpha)$$

$$q=q(\alpha)$$

$$v=\tfrac{1}{2}\pi F(\varphi\backslash\alpha)/K(\alpha),$$

$$\delta_1=[n(1-n)^{-1}(\sin^2\alpha-n)^{-1}]^{\frac{1}{2}}$$

**17.7.3**

$$\Pi(n;\varphi\backslash\alpha)=\delta_1\,[-\tfrac{1}{2}\ln\,[\vartheta_4(v+\beta)/\vartheta_4(v-\beta)]$$

$$+v\vartheta_1'(\beta)/\vartheta_1(\beta)]$$

**17.7.4**

$$\tfrac{1}{2}\ln\frac{\vartheta_4(v+\beta)}{\vartheta_4(v-\beta)}=2\sum_{s=1}^{\infty}s^{-1}q^s(1-q^{2s})^{-1}\sin 2sv\sin 2s\beta$$

**17.7.5**

$$\frac{\vartheta_1'(\beta)}{\vartheta_1(\beta)}=\cot\beta+4\sum_{s=1}^{\infty}q^{2s}(1-2q^{2s}\cos 2\beta+q^{4s})^{-1}\sin 2\beta$$

In the above we can also use Neville's theta functions **16.36.**

**17.7.6** $$\Pi(n\backslash\alpha)=K(\alpha)+\delta_1K(\alpha)Z(\epsilon\backslash\alpha)$$

**Case (ii) Hyperbolic Case $n>1$**

The case $n>1$ can be reduced to the case $0<N<\sin^2\alpha$ by writing

**17.7.7** $$N=n^{-1}\sin^2\alpha,\ p_1=[(n-1)(1-n^{-1}\sin^2\alpha)]^{\frac{1}{2}}$$

**17.7.8**

$$\Pi(n;\,\varphi\backslash\alpha)=-\Pi(N;\,\varphi\backslash\alpha)+F(\varphi\backslash\alpha)$$

$$+\frac{1}{2p_1}\ln\,[(\Delta(\varphi)+p_1\tan\varphi)(\Delta(\varphi)-p_1\tan\varphi)^{-1}]$$

where $\Delta(\varphi)$ is the delta amplitude, **17.2.4.**

**17.7.9** $$\Pi(n\backslash\alpha)=K(\alpha)-\Pi(N\backslash\alpha)$$

**Case (iii) Circular Case $\sin^2\alpha<n<1$**

$$\epsilon=\arcsin\,[(1-n)/\cos^2\alpha]^{\frac{1}{2}}\qquad 0\leq\epsilon\leq\tfrac{1}{2}\pi$$

$$\beta=\tfrac{1}{2}\pi F(\epsilon\backslash 90^\circ-\alpha)/K(\alpha)$$

$$q=q(\alpha)$$

**17.7.10**

$$v=\tfrac{1}{2}\pi F(\varphi\backslash\alpha)/K(\alpha),\ \delta_2=[n(1-n)^{-1}(n-\sin^2\alpha)^{-1}]^{\frac{1}{2}}$$

**17.7.11** $$\Pi(n;\,\varphi\backslash\alpha)=\delta_2(\lambda-4\mu v)$$

**17.7.12**

$$\lambda=\arctan\,(\tanh\beta\tan v)$$

$$+2\sum_{s=1}^{\infty}(-1)^{s-1}s^{-1}q^{2s}(1-q^{2s})^{-1}\sin 2sv\sinh 2s\beta$$

**17.7.13**

$$\mu=\left[\sum_{s=1}^{\infty}sq^{s^2}\sinh 2s\beta\right]\left[1+2\sum_{s=1}^{\infty}q^{s^2}\cosh 2s\beta\right]^{-1}$$

**17.7.14** $$\Pi(n\backslash\alpha)=K(\alpha)+\tfrac{1}{2}\pi\delta_2[1-\Lambda_0(\epsilon\backslash\alpha)]$$

where $\Lambda_0$ is Heuman's Lambda function, **17.4.39.**

---

*See page II.

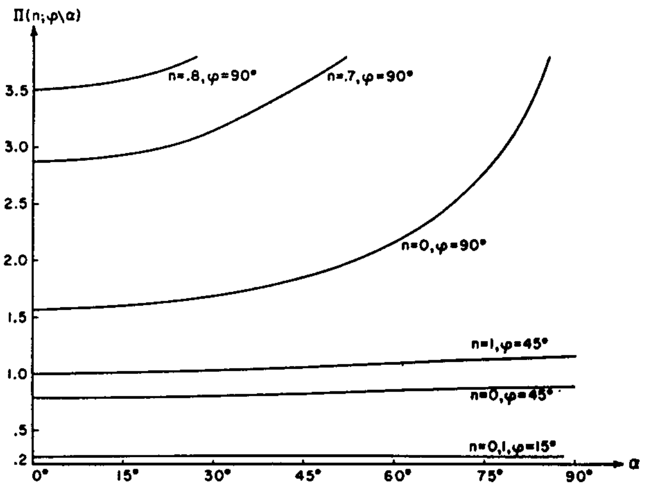

FIGURE 17.11. *Elliptic integral of the third kind* $\Pi(n;\,\varphi\backslash\alpha)$.

### Case (iv) Circular Case $n<0$

The case $n<0$ can be reduced to the case $\sin^2\alpha<N<1$ by writing

**17.7.15**

$$N=(\sin^2\alpha-n)(1-n)^{-1}$$

$$p_2=[-n(1-n)^{-1}(\sin^2\alpha-n)]^{\frac{1}{2}}$$

**17.7.16**

$$[(1-n)(1-n^{-1}\sin^2\alpha)]^{\frac{1}{2}}\Pi(n;\,\varphi\backslash\alpha)$$
$$=[(1-N)(1-N^{-1}\sin^2\alpha)]^{\frac{1}{2}}\Pi(N;\,\varphi\backslash\alpha)$$
$$+p_2^{-1}\sin^2\alpha F(\varphi\backslash\alpha)+\arctan\,[\tfrac{1}{2}p_2\sin 2\varphi/\Delta(\varphi)]$$

**17.7.17**

$$\Pi(n\backslash\alpha)=(-n\cos^2\alpha)(1-n)^{-1}(\sin^2\alpha-n)^{-1}\Pi(N\backslash\alpha)$$
$$+\sin^2\alpha(\sin^2\alpha-n)^{-1}K(\alpha)$$

### Special Cases

**17.7.18** $n=0$

$$\Pi(0;\,\varphi\backslash\alpha)=F(\varphi\backslash\alpha)$$

**17.7.19** $n=0,\ \alpha=0$

$$\Pi(0;\,\varphi\backslash 0)=\varphi$$

**17.7.20** $\alpha=0$

$$\Pi(n;\,\varphi\backslash 0)=(1-n)^{-\frac{1}{2}}\arctan\,[(1-n)^{\frac{1}{2}}\tan\varphi],\quad * \qquad n<1$$
$$=(n-1)^{-\frac{1}{2}}\operatorname{arctanh}\,[(n-1)^{\frac{1}{2}}\tan\varphi],\qquad n>1$$
$$=\tan\varphi\qquad n=1$$

**17.7.21** $\alpha=\pi/2$

$$\Pi(n;\,\varphi\backslash\pi/2)=(1-n)^{-1}[\ln\,(\tan\varphi+\sec\varphi)$$
$$-\tfrac{1}{2}n^{\frac{1}{2}}\ln\,(1+n^{\frac{1}{2}}\sin\varphi)(1-n^{\frac{1}{2}}\sin\varphi)^{-1}]\qquad n\neq 1$$

**17.7.22** $n=\pm\sin\alpha$

$$(1\mp\sin\alpha)\{2\Pi(\pm\sin\alpha;\,\varphi\backslash\alpha)-F(\varphi\backslash\alpha)\}$$
$$=\arctan\,[(1\mp\sin\alpha)\tan\varphi/\Delta(\varphi)]$$

**17.7.23** $n=1\pm\cos\alpha$

$$2\cos\alpha\Pi(1\pm\cos\alpha;\,\varphi\backslash\alpha)=\pm\tfrac{1}{2}\ln\,[(1+\tan\varphi$$
$$\cdot\Delta(\varphi))(1-\tan\varphi\cdot\Delta(\varphi))^{-1}]+\tfrac{1}{2}\ln\,[(\Delta(\varphi)$$
$$+\cos\alpha\cdot\tan\varphi)(\Delta(\varphi)-\cos\alpha\tan\varphi)^{-1}]$$
$$\mp(1\mp\cos\alpha)F(\varphi\backslash\alpha)$$

**17.7.24** $n=\sin^2\alpha$

$$\Pi(\sin^2\alpha;\,\varphi\backslash\alpha)=\sec^2\alpha E(\varphi\backslash\alpha)-(\tan^2\alpha\sin 2\varphi)/(2\Delta(\varphi))$$

**17.7.25** $n=1$

$$\Pi(1;\,\varphi\backslash\alpha)=F(\varphi\backslash\alpha)-\sec^2\alpha E(\varphi\backslash\alpha)+\sec^2\alpha\tan\varphi\Delta(\varphi)$$

## Numerical Methods

### 17.8. Use and Extension of the Tables

**Example 1.** Reduce to canonical form $\int y^{-1}dx$, where

$$y^2=-3x^4+34x^3-119x^2+172x-90$$

By inspection or by solving an equation of the fourth degree we find that

$$y^2=Q_1Q_2 \text{ where } Q_1=3x^2-10x+9,\ Q_2=-x^2+8x-10$$

**First Method**

$Q_1-\lambda Q_2=(3+\lambda)x^2-(10+8\lambda)x+9+10\lambda$ is a perfect square if the discriminant $(10+8\lambda)^2-4(3+\lambda)(9+10\lambda)=0$; i.e., if $\lambda=-\frac{2}{3}$ or $\frac{1}{2}$ and then

$$Q_1+\frac{2}{3}Q_2=\frac{7}{3}(x-1)^2,\ Q_1-\frac{1}{2}Q_2=\frac{7}{2}(x-2)^2$$

Solving for $Q_1$ and $Q_2$ we get

$$Q_1=(x-1)^2+2(x-2)^2,\ Q_2=2(x-1)^2-3(x-2)^2$$

The substitution $t=(x-1)/(x-2)$ then gives

$$\int y^{-1}dx=\pm\int[(t^2+2)(2t^2-3)]^{-\frac{1}{2}}dt$$

---

*See page II.

If the quartic $y^2=0$ has four real roots in $x$ (or in the case of a cubic all three roots are real), we must so combine the factors that no root of $Q_1=0$ lies between the roots of $Q_2=0$ and no root of $Q_2=0$ lies between the roots of $Q_1=0$. Provided this condition is observed the method just described will always lead to real values of $\lambda$. These values may, however, be irrational.

### Second Method

Write

$$t^2=\frac{Q_1}{Q_2}=\frac{3x^2-10x+9}{-x^2+8x-10}$$

and let the discriminant of $Q_2t^2-Q_1$ be

$$\begin{aligned}4T^2&=(8t^2+10)^2-4(t^2+3)(10t^2+9)\\&=4(3t^2+2)(2t^2-1)\end{aligned}$$

Then

$$\int y^{-1}dx=\pm\int T^{-1}dt=\pm\int[(3t^2+2)(2t^2-1)]^{-\frac{1}{2}}dt$$

This method will succeed if, as here, $T^2$ as a function of $t^2$ has real factors. If the coefficients of the given quartic are rational numbers, the factors of $T^2$ will likewise be rational.

### Third Method

Write

$$w=\frac{Q_1}{Q_2}=\frac{3x^2-10x+9}{-x^2+8x-10}$$

and let the discriminant of $Q_2w-Q_1$ be

$$4W=4(3w+2)(2w-1)=4(Aw^2+Bw+C)$$

Then if

$$z^2=W/w \text{ and } Z^2=(B-z^2)^2-4AC=(z^2-1)^2+48$$

$$\int y^{-1}dx=\pm\int Z^{-1}dz$$

However, in this case the factors of $Z$ are complex and the method fails.

Of the second and third methods one will always succeed where the other fails, and if the coefficients of the given quartic are rational numbers, the factors of $T^2$ or $Z^2$, as the case may be, will be rational.

**Example 2.** Reduce to canonical form $\int y^{-1}dx$ where $y^2=x(x-1)(x-2)$.

We use the third method of **Example 1** taking $Q_1=(x-1)$, $Q_2=x(x-2)$ and writing

$$w=\frac{Q_1}{Q_2}=\frac{x-1}{x^2-2x}$$

The discriminant of $Q_2w-Q_1=x^2w-(2w+1)x+1$ is

$$4W=(2w+1)^2-4w=4w^2+1$$

so that

$$W=Aw^2+Bw+C \text{ where } A=1,\ B=0,\ C=\frac{1}{4}$$

and if we write $z^2=W/w$ and

$$Z^2=(B-z^2)^2-4AC=(z^2)^2-1=(z^2-1)(z^2+1),$$

$$\int y^{-1}dx=\pm\int[(z^2-1)(z^2+1)]^{-1/2}dz$$

The first method of **Example 1** fails with the above values of $Q_1$ and $Q_2$ since the root of $Q_1=0$ lies between the roots of $Q_2=0$, and we get imaginary values of $\lambda$. The method succeeds, however, if we take $Q_1=x$, $Q_2=(x-1)(x-2)$, for then the roots of $Q_1=0$ do not lie between those of $Q_2=0$.

**Example 3.** Find $K(80/81)$.

### First Method

Use **17.3.29** with $m=80/81$, $m_1=1/81$, $m_1^{1/2}=1/9$. Since $[(1-m_1^{1/2})(1+m_1^{1/2})^{-1}]^2=.64$, $K(80/81)=1.8\,K(.64)=3.59154\ 500$ to 8D, taking $K(.64)$ from **Table 17.1.**

### Second Method

**Table 17.4** giving $L(m)$ is useful for computing $K(m)$ when $m$ is near unity or $K'(m)$ when $m$ is near zero.

$$K(80/81)=\frac{1}{\pi}K'(80/81)\ln(16\times 81)-L(80/81).$$

By interpolation in **Tables 17.1** and **17.4,** since $80/81=.98765\ 43210$,

$$\begin{aligned}K'(80/81)&=1.57567\ 8423\\L(80/81)&=.00311\ 16543\\K(80/81)&=\pi^{-1}(1.57567\ 8423)(7.16703\ 7877)\\&\qquad-.00311\ 16543\\&=3.59154\ 5000 \text{ to 9D.}\end{aligned}$$

### Third Method

The polynomial approximation **17.3.34** gives to 8D

$$K(80/81)=3.59154\ 501$$

### Fourth Method, Arithmetic-Geometric Mean

Here $\sin^2\alpha=80/81$ and we start with

$$a_0=1,\ b_0=\frac{1}{9},\ c_0=\sqrt{80/81}=.99380\ 79900$$

giving

| $n$ | $a_n$ | $b_n$ | $c_n$ |
|---|---|---|---|
| 0 | 1.00000 00000 | .11111 11111 | .99380 79900 |
| 1 | .55555 55555 | .33333 33333 | .44444 44444 |
| 2 | .44444 44444 | .43033 14829 | .11111 11111 |
| 3 | .43738 79636 | .43733 10380 | .00705 64808 |
| 4 | .43735 95008 | .43735 94999 | .00002 84628 |
| 5 | .43735 95003 | .43735 95003 | 0 |

Thus $K(80/81)=\frac{1}{2}\pi a_5^{-1}=3.59154\ 5001$.

**Example 4.** Find $E(80/81)$.

### First Method

Use **17.3.30** which gives, with $m=80/81$

$$E(80/81)=\frac{10}{9}E(.64)-\frac{1}{5}K(.64)$$
$$=1.01910\ 6047$$

taking $E(.64)$ and $K(.64)$ from **Table 17.1.**

### Second Method

Polynomial approximation, **17.3.36** gives $E(80/81)=1.01910\ 60\underline{60}$. The last two figures must be dropped to keep within the limit of accuracy of the method.

### Third Method

Arithmetic-geometric mean, **17.6.** The numbers were calculated in **Example 3,** fourth method, and we have

$$\frac{K(80/81)-E(80/81)}{K(80/81)}=\frac{1}{2}[c_0^2+2c_1^2+2^2c_2^2+\ .\ .\ .\ +2^5c_5^2]$$
$$=\frac{1}{2}[1.43249\ 71298]$$
$$=.71624\ 85649.$$

Using the value of $K(80/81)$ found in **Example 3,** fourth method, we have

$$E(80/81)=1.01910\ 6048\text{ to 9D}.$$

**Example 5.** Find $q$ when $m=.9995$.
Here $m_1=.0005$ and so from **Table 17.4**

$$Q(m)=.06251\ 563013$$
$$q_1=m_1Q(m)=.00003\ 12578\ 15.$$

From **17.3.19**

$$\ln\left(\frac{1}{q}\right)=\pi^2/\ln\left(\frac{1}{q_1}\right)=\pi^2/10.37324\ 1132$$
$$=.95144\ 84701$$
$$q=.38618\ 125.$$

The computation could also be made using common logarithms with the aid of **17.3.20.** The point of this procedure is that it enables us to calculate $q_1$ without the loss of significant figures which would result from direct interpolation in **Table 17.1.** By this means $\ln(1/q_1)$ can be found without loss of accuracy.

**Example 6.** Find $m$ to 10D when $K'/K=.25$ and when $K'/K=3.5$.

From **17.3.15** with $K'/K=.25$ we can write the iteration formula

$$m^{(n+1)}=1-16e^{-4\pi}\exp\left[-\pi L(m^{(n)})/K'(m^{(n)})\right].$$

Then by iteration using **Tables 17.1** and **17.4**

| $n$ | $m^{(n)}$ |
|---|---|
| 0 | 1. |
| 1 | .99994 42025 |
| 2 | .99994 42041 |
| 3 | .99994 42041 |

Thus $m=.99994\ 42041$.

From **17.3.16** with $K'/K=3.5$ we can write the iteration formula,

$$m^{(n+1)}=16e^{-3.5\pi}\exp\left[-\pi L(m_1^{(n)})/K(m^{(n)})\right]$$

| $n$ | $m^{(n)}$ |
|---|---|
| 0 | 0 |
| 1 | .(3)26841 25043 |
| 2 | .(3)26837 65 |
| 3 | .(3)26837 65 |

Thus $m=.00026\ 83765$.

The above methods in conjunction with the auxiliary **Table 17.4** of $L(m)$ enable us to extend **Table 17.3** for $K'/K>3$, and for $K'/K<.3$.

**Example 7.** Calculate to 5D the Jacobian elliptic function sn $(.75342|.7)$ using **Table 17.5.**

Here

$$m=\sin^2\alpha=.7,\ \alpha=56.789089°.$$

Thus, sn $(.75342|.7)=\sin\varphi$ where $\varphi$ is determined from

$$F(\varphi\backslash 56.789089°)=.75342.$$

Inspection of **Table 17.5** shows that $\varphi$ lies between 40° and 45°. We have from the table of $F(\varphi\backslash\alpha)$

| $\varphi$ \ $\alpha$ | 56° | 58° | 60° |
|---|---|---|---|
| 35° | .63803 | .63945 | .64085 |
| 40° | .73914 | .74138 | .74358 |
| 45° | .84450 | .84788 | .85122 |
| 50° | .95479 | .95974 | .96465 |

From this we form the table of $F(\varphi\backslash 56.789089°)$

| $\varphi$ | $F$ | $\Delta$ | $\Delta_2$ | $\Delta_3$ |
|---|---|---|---|---|
| 35° | .63859 | | | |
| | | 10144 | | |
| 40° | .74003 | | 437 | |
| | | 10581 | | 72 |
| 45° | .84584 | | 509 | |
| | | 11090 | | |
| 50° | .95674 | | | |

A rough estimate now shows that $\varphi$ lies between 40° and 41°. We therefore form the following table of $F(\varphi\backslash 56.789089°)$ by direct interpolation in the foregoing table

| $\varphi$ | $F$ |
|---|---|
| 40.0° | .74003 |
| 40.5° | .75040 |
| 41.0° | .76082 |

whence by linear inverse interpolation

$$\varphi=40.5°+.5°\left[\frac{.75342-.75040}{.76082-.75040}\right]=40.6449°$$

and so $\sin\varphi=.65137=\mathrm{sn}\,(.75342|.7)$.

This method of bivariate interpolation is given merely as an illustration. Other more direct methods such as that of the arithmetic-geometric mean described in **17.6** and illustrated for the Jacobian functions in chapter **16** are less laborious.

**Example 8.** Evaluate

$$\int_2^3 [(2t^2+1)(t^2-2)]^{-1/2}dt.$$

### First Method, Bivariate Interpolation

From **17.4.50** we have

$$\sqrt{5}\int_2^3 [(2t^2+1)(t^2-2)]^{-1/2}dt=F(\varphi_1\backslash\alpha)-F(\varphi_2\backslash\alpha,$$

where

$$\sin^2\alpha=\frac{1}{5},\ \cos\varphi_1=\frac{\sqrt{2}}{3},\ \cos\varphi_2=\frac{\sqrt{2}}{2}$$

Thus $\alpha=26.56505\ 12°$, $\varphi_1=61.87449\ 43°$, $\varphi_2=45°$, $F(\varphi_1\backslash\alpha)=1.115921$ and $F(\varphi_2\backslash\alpha)=.800380$ and therefore the integral is equal to .141114.

### Second Method, Numerical Quadrature

Simpson's formula with 11 ordinates and interval .1 gives .141117.

**Example 9.** Evaluate

$$\int_2^4 [(t^2-2)(t^2-4)]^{-\frac{1}{2}}dt.$$

### First Method, Reduction to Standard Form and Bivariate Interpolation

Here we can use **17.4.48** noting that $a^2=4$, $b^2=2$, and that

$$\int_2^4 [(t^2-2)(t^2-4)]^{-\frac{1}{2}}dt=\int_2^\infty-\int_4^\infty$$
$$=\frac{1}{2}[F(\varphi_1\backslash 45°)-F(\varphi_2\backslash 45°)]$$
$$=\frac{1}{2}[1.854075-.535623]=.659226$$

where

$$\sin\varphi_1=\frac{2}{2},\ \sin\varphi_2=\frac{2}{4},\ \sin^2\alpha=\frac{2}{4}.$$

Thus

$$\alpha=45°,\varphi_1=90°,\varphi_2=30°.$$

### Second Method, Numerical Integration

If we wish to use numerical integration we must observe that the integrand has a singularity at $t=2$ where it behaves like $[8(t-2)]^{-\frac{1}{2}}$.

We remove the singularity at $t=2$, by writing

$$\int_2^4[(t^2-2)(t^2-4)]^{-\frac{1}{2}}dt=\int_2^4 f(t)dt+\int_2^4[8(t-2)]^{-\frac{1}{2}}dt$$

where

$$f(t)=[(t^2-2)(t^2-4)]^{-\frac{1}{2}}-[8(t-2)]^{-\frac{1}{2}}.$$

If we define $f(2)=0$,

$$\int_2^4 f(t)dt$$

can be calculated by numerical quadrature. Also

$$\int_2^4 [8(t-2)]^{-\frac{1}{2}}dt=\left[\frac{1}{\sqrt{2}}(t-2)^{\frac{1}{2}}\right]_2^4=1$$

and thus we calculate the integral as

$$1+\int_2^4 f(t)dt=1-.340773=.659227.$$

**Example 10.** Evaluate

$$u=\int_{17}^\infty (x^3-7x+6)^{-\frac{1}{2}}dx.$$

$x^3-7x+6=(x-1)(x-2)(x+3)$ and we use **17.4.65** with $\beta_1=2$, $\beta_2=1$, $\beta_3=-3$,

$$m=\sin^2\alpha=4/5,\ \lambda=\sqrt{5}/2,\ \cos^2\varphi=3/4.$$

Thus $\alpha=63.434949°$, $\varphi=30°$ and

$$\begin{aligned}u&=2(5)^{-\frac{1}{2}}F(30°\backslash 63.434949°)\\&=2(5)^{-\frac{1}{2}}(.543604)=.486214 \text{ from **Table 17.5.**}\end{aligned}$$

The above integral is of the Weierstrass type and in fact $17=\wp(\frac{1}{2}u;\ 28,\ -24)$ (see chapter **18**).

**Example 11.** Evaluate

$$\int_0^{2/3}(24-12t+2t^2-t^3)^{-1/2}\,dt.$$

We have

$$24-12t+2t^2-t^3=-(t-2)(t^2+12)=-P(t).$$

There is only one real zero and we therefore use **17.4.74** with $P(t)=t^3-2t^2+12t-24$, $\beta=2$ so that $P'(2)=16$, $P''(2)=8$, $\lambda=2$ and therefore

$$m=\sin^2\alpha=\frac{1}{4},\quad \alpha=30°.$$

Therefore the given integral is

$$\int_0^2-\int_{2/3}^2=\frac{1}{2}\left[F(\varphi_1\backslash 60°)-F(\varphi_2\backslash 60°)\right]$$

where

$$\cos\varphi_1=\frac{1}{3},\qquad \varphi_1=70.52877\ 93°$$

$$\cos\varphi_2=\frac{1}{2},\qquad \varphi_2=60°$$

and the integral $=\frac{1}{2}[1.510344-1.212597]=.148874.$

**Example 12.** Use Landen's transformation to evaluate

$$\int_0^{\pi/2}\left(1-\frac{1}{4}\sin^2\theta\right)^{-1/2}d\theta \text{ to 5D.}$$

**First Method, Descending Transformation**

We use **17.5.1** to give

$$1+\sin\alpha_1=\frac{2}{1+\cos 30°}=1.071797$$

$$\cos\alpha_1=[(1-\sin\alpha_1)(1+\sin\alpha_1)]^{1/2}=.997419$$

$$1+\sin\alpha_2=\frac{2}{1+\cos\alpha_1}=1.001292;\ \cos\alpha_2=.999999$$

$$1+\sin\alpha_3=\frac{2}{1+\cos\alpha_2}=1.000000$$

Thus from **17.5.7,**

$$\begin{aligned}\text{the integral}=F(90°\backslash 30°)&=\frac{\pi}{2}(1.071797)(1.001292)\\&=1.68575 \text{ to 5D.}\end{aligned}$$

**Second Method, Ascending Transformation**

We use **17.5.11** to give

$$1+\cos\alpha_{n+1}=2/(1+\sin\alpha_n)$$

| $n$ | $\cos\alpha_n$ | $\sin\alpha_n$ |
|---|---|---|
| 1 | .33333 333 | .94280 904 |
| 2 | .02943 725 | .99956 663 |
| 3 | .00021 673 | .99999 998 |

$$\begin{aligned}&\sin(2\varphi_1-90°)=\sin 30°, && \varphi_1=60°\\&\sin(2\varphi_2-\varphi_1)=\sin\alpha_1\sin\varphi_1, && \varphi_2=57.367805°\\&\sin(2\varphi_3-\varphi_2)=\sin\alpha_2\sin\varphi_2, && \varphi_3=57.348426°\\&\sin(2\varphi_4-\varphi_3)=\sin\alpha_3\sin\varphi_3, && \varphi_4=57.348425°=\Phi.\end{aligned}$$

From **17.5.16**

$$\begin{aligned}F(90°\backslash 30°)&=\frac{2}{1.5}\,\frac{2}{1.94280\ 904}\,\frac{2}{1.99956\ 663}\\&\qquad\frac{2}{1.99999\ 998}\ln\tan\left(45°+\frac{1}{2}\Phi\right)\\&=1.37288\ 050\ln\tan 73.674213°\\&=1.37288\ 050(1.22789\ 30)\end{aligned}$$

$F(90°\backslash 30°)=1.68575$ to 5D.

**Example 13.** Find the value of $F(89.5°\backslash 89.5°)$.

**First Method**

This is a case where interpolation in **Table 17.5** is not possible. We use **17.4.13** which gives

$$F(89.5°\backslash 89.5°)=F(90°\backslash 89.5°)-F(\psi\backslash 89.5°)$$

where

$$\cot\psi=\sin(.5°)\cot(.5°)=\cos(.5°)$$

$$\psi=45.00109\ 084°$$

and $F(\psi\backslash 89.5°)=.881390$ from **Table 17.5.**

$$\begin{aligned}F(90°\backslash 89.5°)&=K(\sin^2 89.5°)=K(.99992\ 38476)\\&=6.12777\ 88\end{aligned}$$

Thus $F(89.5°\backslash 89.5°)=5.246389.$

**Second Method**

Landen's ascending transformation, **17.5.11,** gives

$\cos \alpha_1 = (1-\sin 89.5°)/(1+\sin 89.5°)$

$\sin \alpha_1 = [(1-\cos \alpha_1)(1+\cos \alpha_1)]^{\frac{1}{2}} = .99999\ 99997$

$\cos \alpha_2 = 0$

$\sin \alpha_2 = 1.$

**17.5.12** then gives

$$\sin (2\varphi_1 - 89.5°) = \sin 89.5° \sin 89.5°$$
$$= .99992\ 38476$$

$$2\varphi_1 - 89.5° = 89.2929049°,\ \varphi_1 = 89.39645\ 245°$$

$\sin (2\varphi_2 - \varphi_1) = \sin \alpha_1 \sin \varphi_1, \qquad \varphi_2 = 89.39645\ 602°$
$\sin (2\varphi_3 - \varphi_2) = \sin \varphi_2, \qquad \varphi_3 = \varphi_2 = \Phi.$

Thus **17.5.16** gives

$F(89.5° \backslash 89.5°) =$

$$\left(\frac{1}{.99996\ 19231}\right)^{\frac{1}{2}} \ln (\tan 89.69822\ 801°) = 5.24640.$$

**Example 14.** Evaluate

$$\int_1^2 [(9-t^2)(16+t^2)^3]^{-\frac{1}{2}} dt \text{ to 5D.}$$

From **17.4.51** the given integral

$$= \int_0^2 - \int_0^1 = \frac{1}{80} [E(\varphi_1 \backslash \alpha) - E(\varphi_2 \backslash \alpha)]$$

where

$$\sin \alpha = \tfrac{3}{5}, \qquad \alpha = 36.86990°$$

$$\sin \varphi_1 = \tfrac{1}{3}\sqrt{5}, \qquad \varphi_1 = 48.18968°$$

$$\sin \varphi_2 = \frac{5}{3\sqrt{17}}, \qquad \varphi_2 = 23.84264°.$$

By bivariate interpolation in **Table 17.6** we find that the given integral

$$= \tfrac{1}{80}[.80904 - .41192] = .00496.$$

Simpson's rule with 3 ordinates gives

$$\tfrac{1}{6}[.00504 + .01975 + .005] = .00496.$$

**Example 15.** Evaluate

$\Pi(\tfrac{1}{16}; 45° \backslash 30°) =$

$$\int_0^{\pi/4} (1-\tfrac{1}{16}\sin^2\theta)^{-1}(1-\tfrac{1}{4}\sin^2\theta)^{-\frac{1}{2}} d\theta \text{ to 6D.}$$

This is case (i) of integrals of the third kind, $0 < n < \sin^2 \alpha$, **17.7.3**

$$n = \tfrac{1}{16},\ \varphi = 45°,\ \alpha = 30°,$$

$$\epsilon = \arcsin\, (n/\sin^2 \alpha)^{\frac{1}{2}} = 30°,$$
$$\beta = \tfrac{1}{2}\pi F(30° \backslash 30°)/K(30°) = .49332\ 60$$
$$v = \tfrac{1}{2}\pi F(45° \backslash 30°)/K(30°) = .74951\ 51,$$
$$\delta_1 = (16/45)^{\frac{1}{2}}$$

and so from **17.7.3**

$\Pi (\tfrac{1}{16}; 45° \backslash 30°) =$

$$(16/45)^{\frac{1}{2}} \left\{ -\tfrac{1}{2} \ln \frac{\vartheta_4(v+\beta)}{\vartheta_4(v-\beta)} + \frac{\vartheta_1'(\beta)}{\vartheta_1(\beta)}\, v \right\}$$

$$q = .01797\ 24.$$

Using the $q$-series, **16.27**, for the $\vartheta$ functions we get

$$\Pi (\tfrac{1}{16}; 45° \backslash 30°) = (16/45)^{\frac{1}{2}} \{-.02995\ 89$$
$$+ (1.86096\ 21)(.74951\ 51)\} = .813845.$$

**Table 17.9** gives .81385 with 4 point Lagrangian interpolation.

**Example 16.** Evaluate the complete elliptic integral

$$\Pi\ (\tfrac{1}{16} \backslash 30°) \text{ to 6D.}$$

From **17.7.6** we have

$$\Pi\ (\tfrac{1}{16} \backslash 30°) = K(30°) + (16/45)^{1/2} K(\alpha) Z(\epsilon \backslash 30°)$$

where $\epsilon = \arcsin (n/\sin^2\alpha)^{\frac{1}{2}} = 30°$. Thus using **Table 17.7**

$$\Pi\ (\tfrac{1}{16} \backslash 30°) = 1.743055.$$

**Table 17.9** gives 1.74302 with 5 point Lagrangian interpolation.

**Example 17.** Evaluate

$\Pi\ (\tfrac{5}{8}; 45° \backslash 30°)$

$$= \int_0^{\pi/4} (1-\tfrac{5}{8}\sin^2\theta)^{-1}\, (1-\tfrac{1}{4}\sin^2\theta)^{-1/2}\, d\theta$$

to 6D.

This is case (iii) of integrals of the third kind, $\sin^2 \alpha < n < 1$,

$$n = \tfrac{5}{8},\ \varphi = 45°,\ \alpha = 30°$$

$$\epsilon=\arcsin\,[(1-n)/\cos^2\alpha]^{\frac{1}{2}}=45^\circ$$

$$\beta=\tfrac{1}{2}\pi F(45^\circ\backslash 60^\circ)/K(30^\circ)=.79317\ 74$$

$$v=\tfrac{1}{2}\pi F(45^\circ\backslash 30^\circ)/K(30^\circ)=.74951\ 51$$

$$\delta_2=(40/9)^{\frac{1}{2}}$$

$$q=.01797\ 24$$

and so from **17.7.11**

$$\Pi\ (\tfrac{5}{8};\,45^\circ\backslash 30^\circ)=(40/9)^{1/2}(\lambda-4\mu v)$$

$$=2.10818\ 51\{.55248\ 32-4(.03854\ 26)(.74951\ 51)\}=.921129.$$

**Table 17.9** gives .92113 with 4 point Lagrangian interpolation.

**Example 18.** Evaluate the complete elliptic integral

$$\Pi\ (\tfrac{5}{8}\backslash 30^\circ)\text{ to 5D.}$$

From **17.7.14** we have

$$\Pi\ (\tfrac{5}{8}\backslash 30^\circ)=K(30^\circ)+\frac{\pi}{2}\sqrt{\frac{40}{9}}\,[1-\Lambda_0(\epsilon\backslash 30^\circ)]$$

where $\epsilon=\arcsin\,[(1-n)/\cos^2\alpha]^{1/2}=45^\circ$. Thus using **Table 17.8**

$$\Pi\ (\tfrac{5}{8}\backslash 30^\circ)=2.80099.$$

**Table 17.9** gives 2.80126 by 6 point Lagrangian interpolation. The discrepancy results from interpolation with respect to $n$ for $\varphi=90^\circ$ in **Table 17.9.**

**Example 19.** Evaluate

$$\Pi\ (\tfrac{5}{4};\,45^\circ\backslash 30^\circ)=\int_0^{\pi/4}(1-\tfrac{5}{4}\sin^2\theta)^{-1}(1-\tfrac{1}{4}\sin^2\theta)^{-1/2}\,d\theta$$

to 5D.

Here $n=\frac{5}{4}$, $\varphi=45^\circ$, $\alpha=30^\circ$ and since the characteristic is greater than unity we use **17.7.7**

$$N=n^{-1}\sin^2\alpha=.2,\ p_1=(1/5)^{\frac{1}{2}}$$

$$\Pi\ (\tfrac{5}{4};45^\circ\backslash 30^\circ)=-\Pi(\,2;45^\circ\backslash 30^\circ)+F(45^\circ\backslash 30^\circ)+(\tfrac{1}{2}\sqrt{5})\ \ln\frac{(7/8)^{\frac{1}{2}}+(1/5)^{\frac{1}{2}}}{(7/8)^{\frac{1}{2}}-(1/5)^{\frac{1}{2}}}$$

$$=-.83612+.80437$$

$$+\tfrac{1}{2}\sqrt{5}\ \ln\frac{\sqrt{35}+\sqrt{8}}{\sqrt{35}-\sqrt{8}}$$

$$=1.13214.$$

Numerical quadrature gives the same result.

**Example 20.** Evaluate

$$\Pi\ (-\tfrac{1}{4};\,45^\circ\backslash 30^\circ)=\int_0^{\pi/4}(1+\tfrac{1}{4}\sin^2\theta)^{-1}(1-\tfrac{1}{4}\sin^2\theta)^{-\frac{1}{2}}d\theta$$

to 5D.

Here the characteristic is negative and we therefore use **17.7.15** with $n=-\frac{1}{4}$, $\sin^2\alpha=\frac{1}{4}$

$$N=(1-n)^{-1}(\sin^2\alpha-n)=.4,\quad p_2=\sqrt{.1}$$

and therefore

$$(5/2)^{\frac{1}{2}}\ \Pi\ (-\tfrac{1}{4};\,45^\circ\backslash 30^\circ)=(9/40)^{\frac{1}{2}}\Pi\ (\tfrac{5}{8};\,45^\circ\backslash 30^\circ)+\frac{1}{2}(5/2)^{\frac{1}{2}}F(45^\circ\backslash 30^\circ)+\arctan\,(35)^{-\frac{1}{2}}$$

Using **Tables 4.14, 17.5,** and **17.9** we get

$$\Pi\ (-\tfrac{1}{4};\,45^\circ\backslash 30^\circ)=.76987$$

The table can also be used inversely to find $\varphi=\mathrm{am}\,u$ where $u=F(\varphi\backslash\alpha)$ and so the Jacobian elliptic functions, for example $\mathrm{sn}\,u=\sin\varphi$, $\mathrm{cn}\,u=\cos\varphi$, $\mathrm{dn}\,u=(1-\sin^2\alpha\sin^2\varphi)^{1/2}$. See **Examples 7–11.** Compiled from K. Pearson, Tables of the complete and incomplete elliptic integrals, Cambridge Univ. Press, Cambridge, England, 1934 (with permission). Known errors have been corrected.

## Table 17.5 ELLIPTIC INTEGRAL OF THE FIRST KIND $F(\varphi\backslash\alpha)$

$$F(\varphi\backslash\alpha)=\int_0^{\varphi}(1-\sin^2\alpha\sin^2\theta)^{-\frac{1}{2}}d\theta$$

| $\alpha\backslash\varphi$ | 35° | 40° | 45° | 50° | 55° | 60° |

The author gratefully acknowledges the assistance and encouragement of the personnel of Numerical Analysis Research, UCLA (especially Dr. C. B. Tompkins for generating the author's interest in the project, and Mrs. H. O. Rosay for programming and computing, hand calculation and formula checking) and the personnel of the Computation Laboratory (especially R. Capuano, E. Godefroy, D. Liepman, B. Walter and R. Zucker for the preparation and checking of the tables and maps).

# 18. Weierstrass Elliptic and Related Functions

## Mathematical Properties

### 18.1. Definitions, Symbolism, Restrictions and Conventions

An elliptic function is a single-valued doubly periodic function of a single complex variable which is analytic except at poles and whose only singularities in the finite plane are poles. If $\omega$ and $\omega'$ are a pair of (primitive) half-periods of such a function $f(z)$, then $f(z+2M\omega+2N\omega')=f(z)$, $M$ and $N$ being integers. Thus the study of any such function can be reduced to consideration of its behavior in a *fundamental period parallelogram* (FPP). An elliptic function has a finite number of poles (and the same number of zeros) in a FPP; the number of such poles (zeros) (an irreducible set) is the *order* of the function (poles and zeros are counted according to their multiplicity). All other poles (zeros) are called *congruent* to the irreducible set. The simplest (nontrivial) elliptic functions are of order two. One may choose as the standard function of order two either a function with two simple poles (Jacobi's choice) or one double pole (Weierstrass' choice) in a FPP.

*Weierstrass' $\wp$-Function.* Let $\omega$, $\omega'$ denote a pair of complex numbers with $\mathscr{I}(\omega'/\omega)>0$. Then $\wp(z)=\wp(z|\omega, \omega')$ is an elliptic function of order two with periods $2\omega$, $2\omega'$ and having a double pole at $z=0$, whose principal part is $z^{-2}$; $\wp(z)-z^{-2}$ is analytic in a neighborhood of the origin and vanishes at $z=0$.

*Weierstrass' $\zeta$-Function* $\zeta(z)=\zeta(z|\omega, \omega')$ satisfies the condition $\zeta'(z)=-\wp(z)$; further, $\zeta(z)$ has a simple pole at $z=0$ whose principal part is $z^{-1}$; $\zeta(z)-z^{-1}$ vanishes at $z=0$ and is analytic in a neighborhood of the origin. $\zeta(z)$ is *NOT* an elliptic function, since it is not periodic. However, it is quasi-periodic (see "period" relations), so reduction to FPP is possible.

*Weierstrass' $\sigma$-Function* $\sigma(z)=\sigma(z|\omega, \omega')$ satisfies the condition $\sigma'(z)/\sigma(z)=\zeta(z)$; further, $\sigma(z)$ is an entire function which vanishes at the origin. Like $\zeta$, it is *NOT* an elliptic function, since it is not periodic. However, it is quasi-periodic (see "period" relations), so reduction to FPP is possible.

#### Invariants $g_2$ and $g_3$

Let $W=2M\omega+2N\omega'$, $M$ and $N$ being integers. Then

**18.1.1** $$g_2=60\Sigma' W^{-4} \text{ and } g_3=140\Sigma' W^{-6}$$

are the INVARIANTS, summation being over all pairs $M$, $N$ except $M=N=0$.

#### Alternate Symbolism Emphasizing Invariants

**18.1.2** $$\wp(z)=\wp(z; g_2, g_3)$$

**18.1.3** $$\wp'(z)=\wp'(z; g_2, g_3)$$

**18.1.4** $$\zeta(z)=\zeta(z; g_2, g_3)$$

**18.1.5** $$\sigma(z)=\sigma(z; g_2, g_3)$$

#### Fundamental Differential Equation, Discriminant and Related Quantities

**18.1.6** $$\wp'^2(z)=4\wp^3(z)-g_2\wp(z)-g_3$$

**18.1.7** $$=4(\wp(z)-e_1)(\wp(z)-e_2)(\wp(z)-e_3)$$

**18.1.8** $$\Delta=g_2^3-27g_3^2=16(e_2-e_3)^2(e_3-e_1)^2(e_1-e_2)^2$$

**18.1.9** $$g_2=-4(e_1e_2+e_1e_3+e_2e_3)=2(e_1^2+e_2^2+e_3^2)$$

**18.1.10** $$g_3=4e_1e_2e_3=\tfrac{4}{3}(e_1^3+e_2^3+e_3^3)$$

**18.1.11** $$e_1+e_2+e_3=0$$

**18.1.12** $$e_1^4+e_2^4+e_3^4=g_2^2/8$$

**18.1.13** $$4e_i^3-g_2e_i-g_3=0 \quad (i=1, 2, 3)$$

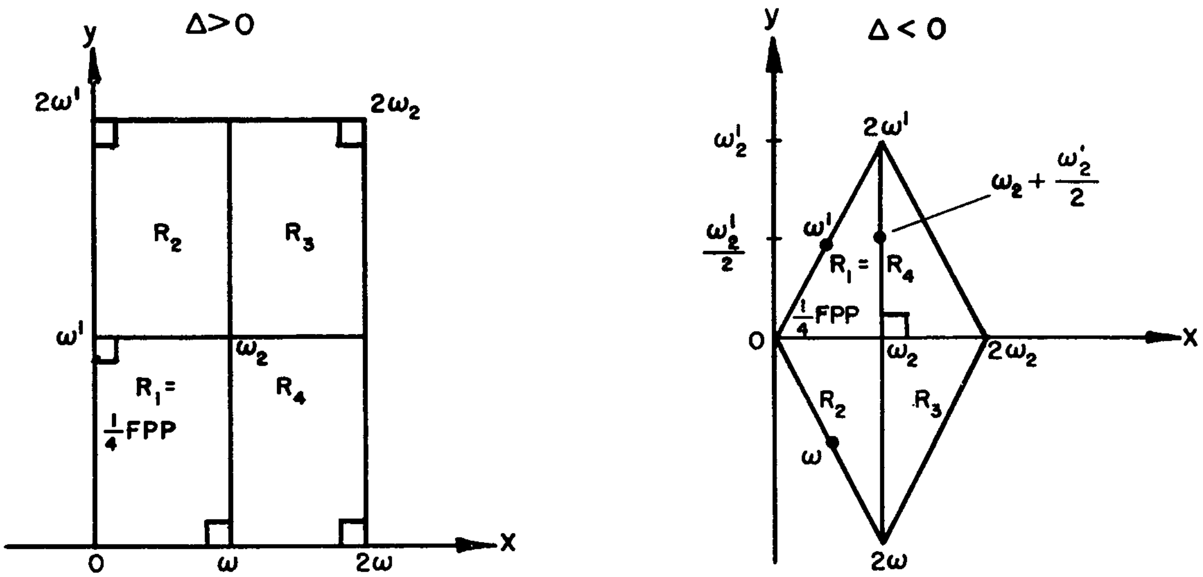
#### Agreement about Values of Invariants (and Discriminant)

We shall consider, in this chapter, only *real* $g_2$ and $g_3$ (this seems to cover most applications)—hence $\Delta$ is real. We shall dichotomize most of what follows (either $\Delta>0$ or $\Delta<0$). Homogeneity relations **18.2.1–18.2.15** enable a further restriction to non-negative $g_3$ (except for one case when $\Delta=0$).

#### Note on Symbolism for Roots of Complex Numbers and for Conjugate Complex Numbers

In this chapter, $z^{1/n}$ ($n$ a positive integer) is used to denote the principal $n$th root of $z$, as in chapter 3; $\bar{z}$ is used to denote the complex conjugate of $z$.

### FPP's, Symbols for Periods, etc.



RECTANGLE — FIGURE 18.1 — RHOMBUS

$\omega_1=\omega$

$\omega_2=\omega+\omega'$ $\qquad$ $\omega_2'=\omega'-\omega$

$\omega_3=\omega'$

| | |
|---|---|
| $\omega$ REAL | $\omega_2$ REAL |
| $\omega'$ PURE IMAG. | $\omega_2'$ PURE IMAG. |
| $\lvert\omega'\rvert\geq\omega$, since $g_3\geq0$ | $\lvert\omega_2'\rvert\geq\omega_2$, since $g_3\geq0$ |

### Fundamental Rectangles

Study of all four functions ($\wp$, $\wp'$, $\zeta$, $\sigma$) can be reduced to consideration of their values in a Fundamental Rectangle including the origin (see **18.2** on homogeneity relations, reduction formulas and processes).

$\Delta>0$

Fundamental Rectangle is $\frac{1}{4}$ FPP, which has vertices 0, $\omega$, $\omega_2$ and $\omega'$

$\Delta<0$

Fundamental Rectangle has vertices 0, $\omega_2$, $\omega_2+\frac{\omega_2'}{2}$, $\frac{\omega_2'}{2}$.

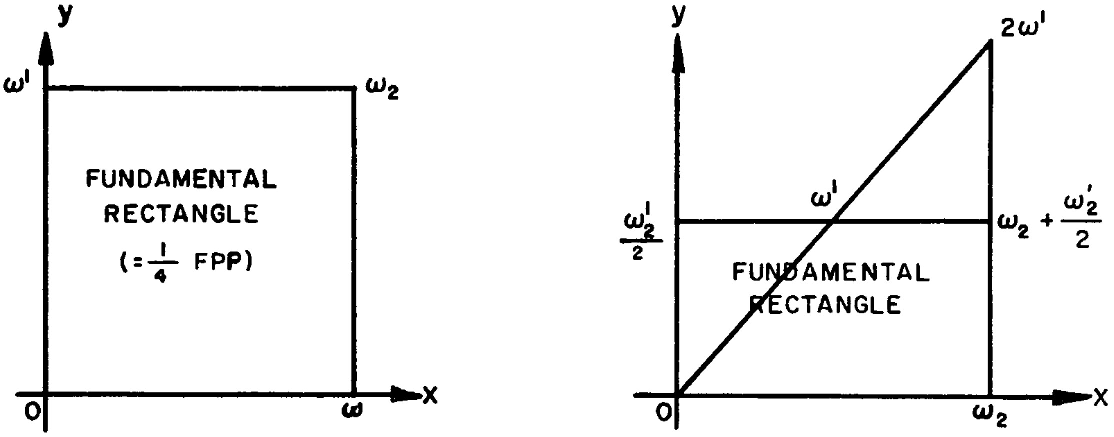


FIGURE 18.2

There is a point on the right boundary of Fundamental Rectangle where $\wp=0$. Denote it by $z_0$.

## 18.2. Homogeneity Relations, Reduction Formulas and Processes

### Homogeneity Relations (Suppose $t \neq 0$)

**Note that Period Ratio is preserved.**

18.2.1 $\wp'(tz|t\omega, t\omega') = t^{-3}\wp'(z|\omega, \omega')$

18.2.2 $\wp(tz|t\omega, t\omega') = t^{-2}\wp(z|\omega, \omega')$

18.2.3 $\zeta(tz|t\omega, t\omega') = t^{-1}\zeta(z|\omega, \omega')$

18.2.4 $\sigma(tz|t\omega, t\omega') = t\sigma(z|\omega, \omega')$

18.2.5 $g_2(t\omega, t\omega') = t^{-4}g_2(\omega, \omega')$

18.2.6 $g_3(t\omega, t\omega') = t^{-6}g_3(\omega, \omega')$

18.2.7 $e_i(t\omega, t\omega') = t^{-2}e_i(\omega, \omega'),\ i = 1, 2, 3$

18.2.8 $\Delta(t\omega, t\omega') = t^{-12}\Delta(\omega, \omega')$

18.2.9 $H_i(t\omega, t\omega') = t^{-2}H_i(\omega, \omega'),\ i = 1, 2, 3$ (See **18.3**)

18.2.10 $q(t\omega, t\omega') = q(\omega, \omega')$ (See **18.10**)

18.2.11 $m(t\omega, t\omega') = m(\omega, \omega')$ (See **18.9**)

18.2.12 $\wp'(tz; t^{-4}g_2, t^{-6}g_3) = t^{-3}\wp'(z; g_2, g_3)$

18.2.13 $\wp(tz; t^{-4}g_2, t^{-6}g_3) = t^{-2}\wp(z; g_2, g_3)$

18.2.14 $\zeta(tz; t^{-4}g_2, t^{-6}g_3) = t^{-1}\zeta(z; g_2, g_3)$

18.2.15 $\sigma(tz; t^{-4}g_2, t^{-6}g_3) = t\sigma(z; g_2, g_3)$

### The Case $g_3 < 0$

Put $t = i$ and obtain, e.g.,

18.2.16 $\wp(z; g_2, g_3) = -\wp(iz; g_2, -g_3)$

Thus the case $g_3 < 0$ can be reduced to one where $g_3 > 0$.

### "Period" Relations and Reduction to the FPP ($M, N$ integers)

18.2.17 $\wp'(z + 2M\omega + 2N\omega') = \wp'(z)$

18.2.18 $\wp(z + 2M\omega + 2N\omega') = \wp(z)$

18.2.19
$$\zeta(z + 2M\omega + 2N\omega') = \zeta(z) + 2M\eta + 2N\eta'$$

18.2.20
$$\sigma(z + 2M\omega + 2N\omega') = (-1)^{M+N+MN}\sigma(z)\exp\,[(z + M\omega + N\omega')(2M\eta + 2N\eta')]$$

18.2.21 where $\eta = \zeta(\omega),\ \eta' = \zeta(\omega')$

### "Conjugate" Values

$f(\bar{z}) = \bar{f}(z)$, where $f$ is any one of the functions $\wp$, $\wp'$, $\zeta$, $\sigma$.

### Reduction to ¼ FPP (See Figure 18.1)

($\bar{s}$ denotes conjugate of $s$)

| | $\Delta > 0$ | $\Delta < 0$ |

| 18.2.33 | $\sigma(z_2) = -\bar{\sigma}(\overline{z_2 - 2\omega'})\exp\,[2\eta'(z_2 - \omega')]$ | $\sigma(z_2) = \bar{\sigma}(\bar{z}_2)$ |

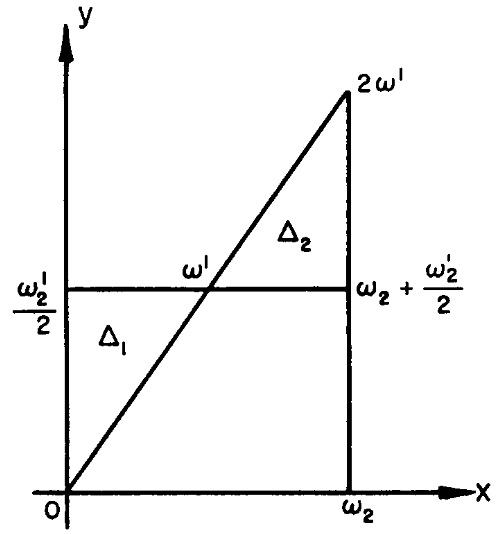

FIGURE 18.3

### Reduction from ¼ FPP to Fundamental Rectangle in Case $\Delta<0$

We need only be concerned with the case when $z$ is in triangle $\Delta_2$ (therefore $2\omega'-z$ is in triangle $\Delta_1$).

**18.2.34** $\wp(z)=\wp(2\omega'-z)$

**18.2.35** $\wp'(z)=-\wp'(2\omega'-z)$

**18.2.36** $\zeta(z)=2\eta'-\zeta(2\omega'-z)$

**18.2.37** $\sigma(z)=\sigma(2\omega'-z)\exp[2\eta'(z-\omega')]$

### Reduction to Case where Real Half-Period is Unity

(preserving period ratio)

| | $\Delta>0$ | $\Delta<0$ |
|---|---|---|
| | | $(\omega_2=\omega+\omega')$ |
| **18.2.38** | $\wp'(z\vert\omega,\omega')=\omega^{-3}\wp'\left(z\omega^{-1}\vert 1,\frac{\omega'}{\omega}\right)$ | $\wp'(z\vert\omega,\omega')=\omega_2^{-3}\wp'\left(z\omega_2^{-1}\middle\vert\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| **18.2.39** | $\wp(z\vert\omega,\omega')=\omega^{-2}\wp\left(z\omega^{-1}\vert 1,\frac{\omega'}{\omega}\right)$ | $\wp(z\vert\omega,\omega')=\omega_2^{-2}\wp\left(z\omega_2^{-1}\middle\vert\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| **18.2.40** | $\zeta(z\vert\omega,\omega')=\omega^{-1}\zeta\left(z\omega^{-1}\vert 1,\frac{\omega'}{\omega}\right)$ | $\zeta(z\vert\omega,\omega')=\omega_2^{-1}\zeta\left(z\omega_2^{-1}\middle\vert\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| **18.2.41** | $\sigma(z\vert\omega,\omega')=\omega\sigma\left(z\omega^{-1}\vert 1,\frac{\omega'}{\omega}\right)$ | $\sigma(z\vert\omega,\omega')=\omega_2\sigma\left(z\omega_2^{-1}\middle\vert\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| **18.2.42** | $g_2(\omega,\omega')=\omega^{-4}g_2\left(1,\frac{\omega'}{\omega}\right)$ | $g_2(\omega,\omega')=\omega_2^{-4}g_2\left(\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| **18.2.43** | $g_3(\omega,\omega')=\omega^{-6}g_3\left(1,\frac{\omega'}{\omega}\right)$ | $g_3(\omega,\omega')=\omega_2^{-6}g_3\left(\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| **18.2.44** | $e_i(\omega,\omega')=\omega^{-2}e_i\left(1,\frac{\omega'}{\omega}\right)$ | $e_i(\omega,\omega')=\omega_2^{-2}e_i\left(\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |
| | $(i=1,2,3)$ | $(i=1,2,3)$ |
| **18.2.45** | $\Delta(\omega,\omega')=\omega^{-12}\Delta\left(1,\frac{\omega'}{\omega}\right)$ | $\Delta(\omega,\omega')=\omega_2^{-12}\Delta\left(\frac{\omega}{\omega_2},\frac{\omega'}{\omega_2}\right)$ |

NOTE: New real half-period is

$$\frac{\omega}{\omega_2}+\frac{\omega'}{\omega_2}=\frac{\omega+\omega'}{\omega_2}=1$$

## 18.3. Special Values and Relations

### Values at Periods

$\wp$, $\wp'$, and $\zeta$ are infinite, $\sigma$ is zero at $z=2\omega_i$, $i=1,2,3$ and at $2\omega_2'(\Delta<0)$.

$\Delta>0$ $\Delta<0$

### Half-Periods

**18.3.1** $$\wp(\omega_i)=e_i(i=1,2,3)$$

**18.3.2** $$\wp'(\omega_i)=0(i=1,2,3)$$

**18.3.3** $$\eta_i=\zeta(\omega_i)(i=1,2,3)$$

**18.3.4** $$\eta_1=\eta,\ \eta_2=\eta+\eta',\ \eta_3=\eta'$$

**18.3.5** $$H_i^2=2e_i^2+e_je_k\ (i,j,k=1,2,3;\ i\neq j,\ i\neq k,\ j\neq k)$$

**18.3.6** $$=(e_i-e_j)(e_i-e_k)=2e_i^2+\frac{g_3}{4e_i}=3e_i^2-\frac{g_2}{4}$$

| | $\Delta>0$ | $\Delta<0$ |
|---|---|---|
| **18.3.7** | $e_i$ real | $e_2$ real and non-negative |
| **18.3.8** | $e_1>0\geq e_2>e_3$<br>(equality when $g_3=0$) | ($e_2=0$ when $g_3=0$)<br>$e_1=-\alpha+i\beta$, $e_3=\bar{e}_1$<br>where $\alpha\geq 0, \beta>0$<br>(equality when $g_3=0$) |

### One-Third Period Relations

At $z=2\omega_i/3(i=1, 2, 3)$ or $2\omega_2'/3, \wp''^2=12\wp\wp'^2$;

equivalently:

**18.3.30**

$$48\wp^4-24g_2\wp^2-48g_3\wp-g_2^2=0$$

| | $\Delta>0$ | $\Delta<0$ |
|---|---|---|
| **18.3.31** | $\zeta(2\omega/3)=\frac{2\eta}{3}+\left[\frac{\wp(2\omega/3)}{3}\right]^{\frac{1}{2}}$ | $\zeta(2\omega_2/3)=\frac{2\eta_2}{3}+\left[\frac{\wp(2\omega_2/3)}{3}\right]^{\frac{1}{2}}$ |
| **18.3.32** | $\zeta(2\omega'/3)=\frac{2\eta'}{3}-\left[\frac{\wp(2\omega'/3)}{3}\right]^{\frac{1}{2}}$ | $\zeta(2\omega_2'/3)=\frac{2\eta_2'}{3}-\left[\frac{\wp(2\omega_2'/3)}{3}\right]^{\frac{1}{2}}$ |
| **18.3.33** | $\zeta(2\omega_2/3)=\frac{2\eta_2}{3}+\left[\frac{\wp(2\omega_2/3)}{3}\right]^{\frac{1}{2}}$ | $\zeta(2\omega'/3)=\frac{2\eta'}{3}+\left[\frac{\wp(2\omega'/3)}{3}\right]^{\frac{1}{2}}$ |
| **18.3.34** | $\sigma(2\omega/3)=\frac{-\exp[2\eta\omega/9]}{\sqrt[3]{\wp'(2\omega/3)}}$ | $\sigma(2\omega_2/3)=\frac{-\exp[2\eta_2\omega_2/9]}{\sqrt[3]{\wp'(2\omega_2/3)}}$ |
| **18.3.35** | $\sigma(2\omega'/3)=\frac{-\exp[2\eta'\omega'/9]}{[\wp'(2\omega'/3)]^{1/3}e^{2\pi i/3}}$ | $\sigma(2\omega_2'/3)=\frac{-\exp[2\eta_2'\omega_2'/9]}{[\wp'(2\omega_2'/3)]^{1/3}e^{2\pi i/3}}$ |
| **18.3.36** | $\sigma(2\omega_2/3)=\frac{-\exp[2\eta_2\omega_2/9]}{[\wp'(2\omega_2/3)]^{1/3}e^{2\pi i/3}}$ | $\sigma(2\omega'/3)=\frac{-\exp[2\eta'\omega'/9]}{[\wp'(2\omega'/3)]^{1/3}e^{2\pi i/3}}$ |

### Legendre's Relation

| | | |
|---|---|---|
| **18.3.37** | $\eta\omega'-\eta'\omega=\pi i/2$<br>(also valid for $\Delta<0$) | $\eta_2\omega_2'-\eta_2'\omega_2=\pi i$ |

### Relations Among the $H_i$

**18.3.38**

$$H_1^2+H_2^2+H_3^2=3g_2/4$$

**18.3.39**

$$H_1^2H_2^2+H_2^2H_3^2+H_3^2H_1^2=0$$

**18.3.40**
$$H_1^2H_2^2H_3^2=-\Delta/16$$

**18.3.41**
$$16H_i^6-12g_2H_i^4+\Delta=0 (i=1, 2, 3)$$

## 18.4. Addition and Multiplication Formulas

### Addition Formulas[2] ($z_1\neq z_2$)

**18.4.1**
$$\wp(z_1+z_2)=\frac{1}{4}\left[\frac{\wp'(z_1)-\wp'(z_2)}{\wp(z_1)-\wp(z_2)}\right]^2-\wp(z_1)-\wp(z_2)$$

**18.4.2**
$$\wp'(z_1+z_2)=\frac{\wp(z_1+z_2)[\wp'(z_1)-\wp'(z_2)]+\wp(z_1)\wp'(z_2)-\wp'(z_1)\wp(z_2)}{\wp(z_2)-\wp(z_1)}$$

**18.4.3**
$$\zeta(z_1+z_2)=\zeta(z_1)+\zeta(z_2)+\frac{1}{2}\frac{\wp'(z_1)-\wp'(z_2)}{\wp(z_1)-\wp(z_2)}$$

**18.4.4**
$$\sigma(z_1+z_2)\sigma(z_1-z_2)=-\sigma^2(z_1)\sigma^2(z_2)[\wp(z_1)-\wp(z_2)]$$

### Duplication and Triplication Formulas

$$\left[\text{Note that } \wp''=6\wp^2(z)-\frac{g_2}{2}, \wp'^2(z)=4\wp^3(z)-g_2\wp(z)-g_3 \text{ and } \wp'''(z)=12\wp(z)\wp'(z)\right]$$

**18.4.5**
$$\wp(2z)=-2\wp(z)+\left[\frac{\wp''(z)}{2\wp'(z)}\right]^2$$

**18.4.6**
$$\wp'(2z)=\frac{-4\wp'^4(z)+12\wp(z)\wp'^2(z)\wp''(z)-\wp''^3(z)}{4\wp'^3(z)}$$

**18.4.7**
$$\zeta(2z)=2\zeta(z)+\wp''(z)/2\wp'(z)$$

**18.4.8**
$$\sigma(2z)=-\wp'(z)\sigma^4(z)$$

**18.4.9**
$$\zeta(3z)=3\zeta(z)+\frac{4\wp'^3(z)}{\wp'(z)\wp'''(z)-\wp''^2(z)}$$

**18.4.10**
$$\sigma(3z)=-\wp'^2(z)\sigma^9(z)[\wp(2z)-\wp(z)]$$

## 18.5. Series Expansions

### Laurent Series

**18.5.1**
$$\wp(z)=z^{-2}+\sum_{k=2}^{\infty}c_kz^{2k-2}$$

**18.5.2** where
$$c_2=g_2/20,\ c_3=g_3/28$$

and

**18.5.3**
$$c_k=\frac{3}{(2k+1)(k-3)}\sum_{m=2}^{k-2}c_mc_{k-m},\ k\geqq 4$$

**18.5.4**
$$\wp'(z)=-2z^{-3}+\sum_{k=2}^{\infty}(2k-2)c_kz^{2k-3}$$

**18.5.5**
$$\zeta(z)=z^{-1}-\sum_{k=2}^{\infty}c_kz^{2k-1}/(2k-1)$$

**18.5.6**
$$\sigma(z)=\sum_{m,n=0}^{\infty}a_{m,n}(\tfrac{1}{2}g_2)^m(2g_3)^n\cdot\frac{z^{4m+6n+1}}{(4m+6n+1)!}$$

---

[2] Formulas for $\zeta$ and $\sigma$ are *not* true algebraic addition formulas.

$$\text{where } a_{0,0}=1 \text{ and} \tag{18.5.7}$$

$$a_{m,n}=3(m+1)a_{m+1,n-1}+\frac{16}{3}(n+1)a_{m-2,n+1}-\frac{1}{3}(2m+3n-1)(4m+6n-1)a_{m-1,n}, \tag{18.5.8}$$

it being understood that $a_{m,n}=0$ if either subscript is negative.

(The radius of convergence of the above series for $\wp-z^{-2}$, $\wp'+2z^{-3}$ and $\zeta-z^{-1}$ is equal to the smallest of $|2\omega|$, $|2\omega'|$ and $|2\omega\pm2\omega'|$; series for $\sigma$ converges for all $z$.)

**Values of Coefficients[3] $c_k$ in Terms of $c_2$ and $c_3$**

$$c_4=c_2^2/3 \tag{18.5.9}$$

$$c_5=3c_2c_3/11 \tag{18.5.10}$$

$$c_6=[2c_2^3+3c_3^2]/39 \tag{18.5.11}$$

$$c_7=2c_2^2c_3/33 \tag{18.5.12}$$

$$c_8=5c_2(11c_2^3+36c_3^2)/7293 \tag{18.5.13}$$

$$c_9=c_3(29c_2^3+11c_3^2)/2717 \tag{18.5.14}$$

$$c_{10}=(242c_2^5+1455c_2^2c_3^2)/240669 \tag{18.5.15}$$

$$c_{11}=14c_2c_3(389c_2^3+369c_3^2)/3187041 \tag{18.5.16}$$

$$c_{12}=(114950c_2^6+1080000c_2^3c_3^2+166617c_3^4)/891678645 \tag{18.5.17}$$

$$c_{13}=10c_2^2c_3(297c_2^3+530c_3^2)/11685817 \tag{18.5.18}$$

$$c_{14}=\frac{2c_2(528770c_2^6+7164675c_2^3c_3^2+2989602c_3^4)}{(306735)(215441)} \tag{18.5.19}$$

$$c_{15}=\frac{4c_3(62921815c_2^6+179865450c_2^3c_3^2+14051367c_3^4)}{(179685)(38920531)} \tag{18.5.20}$$

$$c_{16}=\frac{c_2^2(589578550c_2^6+1086511320c_2^3c_3^2+875341836c_3^4)}{(5909761)(5132565)} \tag{18.5.21}$$

$$c_{17}=\frac{c_2c_3(30171955c_2^6+126138075c_2^3c_3^2+28151739c_3^4)}{(920205)(6678671)} \tag{18.5.22}$$

$$c_{18}=\frac{1541470\cdot949003c_2^9+30458088737\cdot1155c_2^6c_3^2+122378650673\cdot378c_2^3c_3^4+2348703\cdot887777c_3^6}{(1342211013)(4695105713)} \tag{18.5.23}$$

$$c_{19}=\frac{2c_2^2c_3(3365544215c_2^6+429852433\cdot45c_2^3c_3^2+8527743477c_3^4)}{(91100295)(113537407)} \tag{18.5.24}$$

---

[3] *NOTES:*

1. $c_4$–$c_{16}$ were computed and checked independently by D. H. Lehmer; these were double-checked by substituting $g_2=20\ c_2$, $g_3=28\ c_3$ in values given in [18.10].

2. $c_{17}$–$c_{18}$ were derived from values in [18.10] by the same substitution. These were checked (numerically) for particular values of $g_2$, $g_3$.

3. $c_{19}$ is given incorrectly in [18.12] (factor 13 is missing in denominator of third term of bracket); this value was computed independently.

4. No factors of any of the above integers with more than ten digits are known to the author. This is not necessarily true of smaller integers, which have, in many instances, been arranged for convenient use with a desk calculator.

## Value[4] of Coefficients $a_{m,n}$

| $n$ ↑ → $m$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |

---

[4] Values of $a_{m,n}$ in unfactored form for $4m+6n+1\leq 35$ are given in [18.25], p. 7; of $(a_{m,n})3^{-n}$ in factored form in [18.15], Vol. 4, p. 89 for $4m+6n+1\leq 25$. Additional values were computed and checked on desk calculators; primality of large factors was established with the aid of SWAC (National Bureau of Standards Western Automatic Computer).

### Reversed Series[5] for Large $|\wp|$

**18.5.25**

$$z=\frac{1}{2}\Bigg[2u+c_2u^5+c_3u^7+\frac{\alpha_2^2}{3}u^9+\frac{6\alpha_2\alpha_3}{11}u^{11}$$

$$+\frac{1}{13}(3\alpha_3^2+5\alpha_2^3)u^{13}+\alpha_2^2\alpha_3u^{15}+\frac{5\alpha_2}{68}(12\alpha_3^2+7\alpha_2^3)u^{17}$$

&+\dots,
\end{aligned}
$$

**18.5.64** where $\alpha=(z-\omega_i)$.

### Other Series Involving $\zeta$

*Series near* $z_0$ $[\wp(z_0)=0]$

**18.5.65**

$$\zeta-\zeta_0=\wp_0'\left[-\frac{u^2}{2}+\frac{c_2u^6}{2}+\frac{c_3u^8}{2}-\frac{c_2^2u^{10}}{3}-\frac{19c_2c_3u^{12}}{22}+\frac{(5c_2^3-12c_3^2)}{26}u^{14}+\frac{61c_2^2c_3u^{16}}{66}\right]+\left[\frac{5c_2u^3}{3}+\frac{7c_3u^5}{2}-\frac{5c_2^2u^7}{7}-\frac{11c_2c_3u^9}{3}+\frac{(10c_2^3-84c_3^2)}{33}u^{11}+\frac{1363c_2^2c_3}{429}u^{13}+\frac{c_2(2316c_3^2-55c_2^3)}{429}u^{15}\right]+\ldots,$$

**18.5.66** where $u=(z-z_0)$,

**18.5.67** $\zeta_0\equiv\zeta(z_0)$

*Series near* $\omega_i$

**18.5.68**

$$(\zeta-\eta_i)=-e_i\alpha-\frac{(3e_i^2-5c_2)}{3}\alpha^3-\frac{(10c_2e_i+21c_3)\alpha^5}{5}-\frac{(7c_2e_i^2+21c_3e_i+5c_2^2)\alpha^7}{7}-\frac{(6c_3e_i^2+10c_2^2e_i+11c_2c_3)\alpha^9}{3}-\frac{\left(22c_2^2e_i^2+92c_2c_3e_i+105c_3^2-\frac{10}{3}c_2^3\right)\alpha^{11}}{11}-\frac{2}{13}\left(\frac{364}{11}c_2c_3e_i^2+\frac{110}{3}c_2^3e_i+42c_3^2e_i+\frac{607}{11}c_2^2c_3\right)\alpha^{13}-\frac{1}{3}\left(\frac{127}{13}c_2^3e_i^2+\frac{171}{13}c_3^2e_i^2+\frac{681}{11}c_2^2c_3e_i+\frac{9150}{143}c_2c_3^2+\frac{5}{13}c_2^4\right)\alpha^{15}-\ldots,$$

**18.5.69** where $\alpha=(z-\omega_i)$

### Reversed Series for Small $|\sigma|$

**18.5.70**

$$z=\sigma+\frac{\gamma_2}{5}\sigma^5+\frac{\gamma_3}{7}\sigma^7+\frac{3\gamma_2^2}{14}\sigma^9+\frac{19\gamma_2\gamma_3}{55}\sigma^{11}+\frac{3842\gamma_2^3+861\gamma_3^2}{6006}\sigma^{13}+\ldots,$$

**18.5.71** where $\gamma_2=g_2/48$

**18.5.72** $\gamma_3=g_3/120$

For reversion of Maclaurin series, see **3.6.25** and [18.18].

## 18.6. Derivatives and Differential Equations

*Ordinary* $(c_2=g_2/20,\ c_3=g_3/28)$

**18.6.1** $\zeta'(z)=-\wp(z)$

**18.6.2** $\sigma'(z)/\sigma(z)=\zeta(z)$

**18.6.3**

$$\wp'^2(z)=4\wp^3(z)-g_2\wp(z)-g_3=4(\wp^3-5c_2\wp-7c_3)$$

**18.6.4** $\wp''(z)=6\wp^2(z)-\tfrac{1}{2}g_2=6\wp^2-10c_2$

**18.6.5** $\wp'''(z)=12\wp\wp'$

**18.6.6**

$$\wp^{(4)}(z)=12(\wp\wp''+\wp'\wp')=5!\left[\wp^3-3c_2\wp-\frac{14c_3}{5}\right]$$

**18.6.7**

$$\wp^{(5)}(z)=12(\wp\wp'''+2\wp'\wp''+\wp''\wp')=3\cdot5!\,\wp'[\wp^2-c_2]$$

**18.6.8**

$$\wp^{(6)}(z)=12(\wp\wp^{(4)}+3\wp'\wp'''+3\wp''\wp''+\wp'''\wp')$$

**18.6.9** $=7![\wp^4-4c_2\wp^2-4c_3\wp+5c_2^2/7]$

**18.6.10** $\wp^{(7)}(z)=4\cdot7!\,\wp'[\wp^3-2c_2\wp-c_3]$

**18.6.11**

$$\wp^{(8)}(z)=9![\wp^5-5c_2\wp^3-5c_3\wp^2+(10c_2^2\wp+11c_2c_3)/3]$$

**18.6.12**

$$\wp^{(9)}(z)=5\cdot9!\,\wp'[\wp^4-3c_2\wp^2-2c_3\wp+2c_2^2/3]$$

**18.6.13**

$$\wp^{(10)}(z)=11![\wp^6-6c_2\wp^4-6c_3\wp^3+7c_2^2\wp^2+(342c_2c_3\wp+84c_3^2-10c_2^3)/33]$$

**18.6.14**

$$\wp^{(11)}(z)=6\cdot11!\,\wp'[\wp^5-4c_2\wp^3-3c_3\wp^2+(77c_2^2\wp+57c_2c_3)/33]$$

**18.6.15**

$$\wp^{(12)}(z)=13![\wp^7-7c_2\wp^5-7c_3\wp^4+35c_2^2\wp^3/3+210c_2c_3\wp^2/11+(84c_3^2-35c_2^3)\wp/13-1363c_2^2c_3/429]$$

**18.6.16**

$$\wp^{(13)}(z)=7\cdot13!\,\wp'[\wp^6-5c_2\wp^4-4c_3\wp^3+5c_2^2\wp^2+60c_2c_3\wp/11+(12c_3^2-5c_2^3)/13]$$

**18.6.17**

$$\wp^{(14)}(z)=15![\wp^8-8c_2\wp^6-8c_3\wp^5+52c_2^2\wp^4/3+328c_2c_3\wp^3/11+(444c_3^2-328c_2^3)\wp^2/39-488c_2^2c_3\wp/33+c_2(55c_2^3-2316c_3^2)/429]$$

**18.6.18**

$$\wp^{(15)}(z)=8\cdot15!\,\wp'[\wp^7-6c_2\wp^5-5c_3\wp^4+26c_2^2\wp^3/3+123c_2c_3\wp^2/11+(111c_3^2-82c_2^3)\wp/39-61c_2^2c_3/33]$$

### Partial Derivatives with Respect to Invariants

**18.6.19**

$$\Delta\frac{\partial\wp}{\partial g_3}=\wp'\left(3g_2\zeta-\frac{9}{2}g_3z\right)+6g_2\wp^2-9g_3\wp-g_2^2$$

**18.6.20**

$$\Delta\frac{\partial\wp}{\partial g_2}=\wp'\left(-\frac{9}{2}g_3\zeta+\frac{g_2^2z}{4}\right)-9g_3\wp^2+\frac{g_2^2}{2}\wp+\frac{3}{2}g_2g_3$$

**18.6.21**

$$\Delta\frac{\partial\zeta}{\partial g_3}=-3\zeta\left(g_2\wp+\frac{3}{2}g_3\right)+\frac{1}{2}z\left(9g_3\wp+\frac{1}{2}g_2^2\right)-\frac{3}{2}g_2\wp'$$

**18.6.22**

$$\Delta\frac{\partial\zeta}{\partial g_2}=\frac{1}{2}\zeta\left(9g_3\wp+\frac{1}{2}g_2^2\right)-\frac{1}{2}g_2z\left(\frac{1}{2}g_2\wp+\frac{3}{4}g_3\right)+\frac{9}{4}g_3\wp'$$

**18.6.23** $$\Delta\frac{\partial\sigma}{\partial g_3}=\frac{3}{2}g_2\sigma''+\frac{9}{2}g_3\sigma+\frac{1}{8}g_2^2z^2\sigma-\frac{9}{2}g_2z\sigma'$$

**18.6.24**

$$\Delta\frac{\partial\sigma}{\partial g_2}=-\frac{9}{4}g_3\sigma''-\frac{1}{4}g_2^2\sigma-\frac{3}{16}g_2g_3z^2\sigma+\frac{1}{4}g_2^2z\sigma'$$

$$\left(\text{here }'\text{ denotes }\frac{\partial}{\partial z}\right)$$

### Differential Equations

| | *Equation* | *Solution* |
|---|---|---|
| **18.6.25** | $y'^3=y^2(y-a)^2$ | $y=\frac{a}{2}+\frac{27}{16}\wp'\left(\frac{z}{2}; 0, -\frac{64a^2}{729}\right)$ |
| **18.6.26** | $y'^3=(y^3-3ay^2+3y)^2$ | $y=\frac{2}{a-3\wp'(z; 0, g_3)}$, <br> $g_3=\frac{4-3a^2}{27}$ |
| **18.6.27** | $y'^4=\frac{128}{3}(y+a)^2(y+b)^3$ | $y=6\wp^2(z; g_2, 0)-b$, <br> $g_2=-\frac{2}{3}(a-b)$ |

$y''=[a\wp(z)+b]y$ (Lamé's equation)—see [18.8], 2.26

For other (more specialized) equations (of orders 1–3) involving $\wp(z)$, see [18.8], nos. 1.49, 2.28, 2.72–3, 2.439–440, 3.9–12.

For the use of $\wp(z)$ in solving differential equations of the form $y'^m+A(z,y)=0$, where $A(z,y)$ is a polynomial in $y$ of degree $2m$, with coefficients which are analytic functions of $z$, see [18.7], p. 312ff.

## 18.7. Integrals

*Indefinite*

**18.7.1** $$\int\wp^2(z)dz=\frac{1}{6}\wp'(z)+\frac{1}{12}g_2z$$

**18.7.2** $$\int\wp^3(z)dz=\frac{1}{120}\wp'''(z)-\frac{3}{20}g_2\zeta(z)+\frac{1}{10}g_3z$$

(formulas for higher powers may be derived by integration of formulas for $\wp^{(2k)}(z)$)

For $\int\wp^n(z)dz$, $n$ any positive integer, see [18.15] vol. 4, pp. 108–9.

If $\wp'(a)\neq 0$

**18.7.3**

$$\wp'(a)\int\frac{dz}{\wp(z)-\wp(a)}=2z\zeta(a)+\ln\sigma(z-a)-\ln\sigma(z+a)$$

For $\int dz/[\wp(z)-\wp(a)]^n$, $(\wp'(a)\neq 0)$ $n$ any positive integer, see [18.15], vol. 4, pp. 109–110.

*Definite*

| | $\Delta>0$ | $\Delta<0$ |
|---|---|---|
| **18.7.4** | $\omega=\int_{e_1}^{\infty}\frac{dt}{\sqrt{s(t)}}$ | $\omega_2=\int_{e_2}^{\infty}\frac{dt}{\sqrt{s(t)}}$ |
| **18.7.5** | $\omega'=i\int_{-\infty}^{e_3}\frac{dt}{\sqrt{\lvert s(t)\rvert}}$ | $\omega_2'=i\int_{-\infty}^{e_2}\frac{dt}{\sqrt{\lvert s(t)\rvert}}$ |

**18.7.6** where $t$ is real and

**18.7.7** $$s(t)=4t^3-g_2t-g_3$$

## 18.8 Conformal Mapping

$w=u+iv$

$\Delta>0$

$w=\wp(z)$ maps the Fundamental Rectangle onto the half-plane $v\leq 0$; if $|\omega'|=\omega(g_3=0)$, the isosceles triangle $0\omega\omega_2$ is mapped onto $u\geq 0$, $v\leq 0$.

$w=\wp'(z)$ maps the Fundamental Rectangle onto the $w$-plane less quadrant III; if $|\omega'|=\omega$, the triangle $0\omega\omega_2$ is mapped onto $v\geq 0$, $v\geq u$.

$\Delta<0$

$w=\wp(z)$ maps the Fundamental Rectangle onto the half-plane $v\leq 0$; if $|\omega_2'|=\omega_2(g_3=0)$, the isosceles triangle $0\omega_2\omega'$ is mapped onto $u\geq 0$, $v\leq 0$.

$w=\wp'(z)$ maps the Fundamental Rectangle onto most of the $w$-plane less quadrant III; if $|\omega_2'|=\omega_2$, the triangle $0\omega_2\omega'$ is mapped onto $v\geq 0$, $v\geq u$.

($a$=period ratio)

$w=\zeta(z)$ maps the Fundamental Rectangle onto the half-plane $u\geq 0$. If $a\leq 1.9$ (approx.), $v\leq 0$; otherwise the image extends into quadrant I. For very large $a$, the image has a large area in quadrant I.

$w=\sigma(z)$ maps the Fundamental Rectangle onto quadrant I if a $<1.9$ (approx.), onto quadrants I and II if $1.9\leq a<3.8$ (approx.). For large $a$, $\arg[\sigma(\omega_2)]\approx\frac{\pi^2 a}{12}$; consequently the image winds around the origin for large $a$.

Other maps are described in [18.23] arts. 13.7 (square on circle), 13.11 (ring on plane with 2 slits in line) and in [18.24], p. 35 (double half equilateral triangle on half-plane).

$w=\zeta(z)$ maps the Fundamental Rectangle onto the half-plane $u\geq 0$. The image is mostly in quadrant IV for small $a$, entirely so for (approx.) $1.3\leq a\leq 3.8$. For very large $a$, the image has a large area in quadrant I.

$w=\sigma(z)$ maps the Fundamental Rectangle onto quadrant I if $a<3.8$ (approx.), onto quadrants I and II if $3.8\leq a<7.6$ (approx.). For large $a$, $\arg\left[\sigma\left(\omega_2+\frac{\omega_2'}{2}\right)\right]\approx\frac{\pi^2 a}{24}$; consequently the image winds around the origin for large $a$.

Other maps are described in [18.23] arts. 13.8 (equilateral triangle on half-plane) and 13.9 (isosceles triangle on half-plane).

### Obtaining $\wp'$ from $\wp'^2$

**Fundamental Rectangle** $\Delta>0$

**Fundamental Rectangle** $\Delta<0$

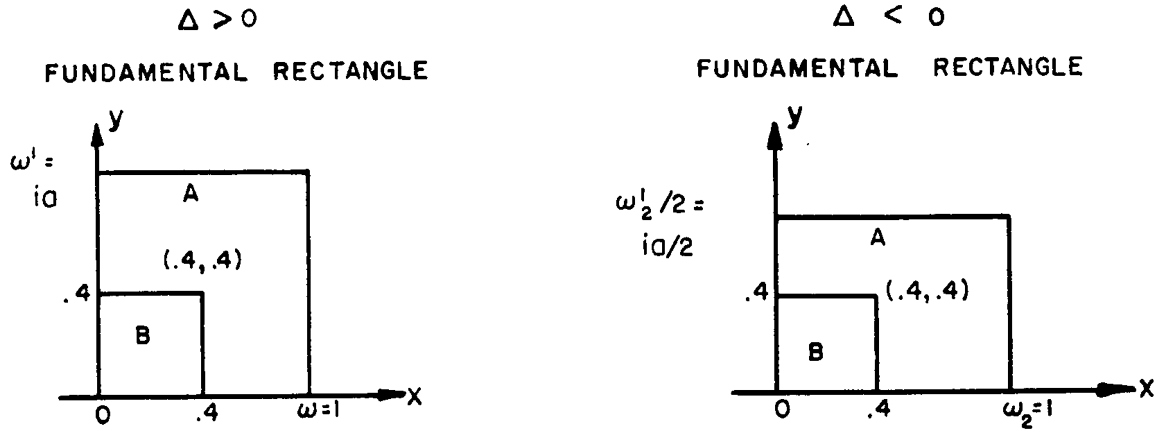

FIGURE 18.4

In region A

$\mathscr{R}(\wp')\geq 0$ if $y\geq .4$ and $x\leq .5$; $\mathscr{I}(\wp')\geq 0$ elsewhere

In region A

(1) If $a\geq 1.05$, use criterion for region A for $\Delta>0$.

(2) If $1\leq a<1.05$: $\mathscr{R}(\wp')\geq 0$ if $y\geq .4$ and $x\leq .4$, $-\pi/4<\arg(\wp')<3\pi/4$ if $.4<y\leq .5$ and $.4<x\leq .5$. $\mathscr{I}(\wp')\geq 0$ elsewhere

In region B

The sign (indeed, perhaps one or more significant digits) of $\wp'$ is obtainable from the first term, $-2/z^3$, of the Laurent series for $\wp'$.

In region B

Use the criterion for region B for $\Delta>0$.

(Precisely similar criteria apply when the real half-period $\neq 1$)

[$E(m)$ is a complete elliptic integral of the 2d kind (see chapter 17).]

### 18.10. Relations with Theta Functions (chapter 16)

The formal definitions of the four $\vartheta$ functions are given by the series **16.27.1–16.27.4** which converge for all complex $z$ and all $q$ defined below. (Some authors use $\pi z$, instead of $z$, as the independent variable.)

These functions depend on $z$ and on a parameter $q$, which is usually suppressed. Note that

$$\vartheta_1'(0)=\vartheta_2(0)\vartheta_3(0)\vartheta_4(0), \text{ where } \vartheta_i(0)=\vartheta_i(0, q).$$

| | $\Delta>0$ | $\Delta<0$ |
|---|---|---|
| **18.10.1** | $\tau=\omega'/\omega$ | $\tau_2=\omega_2'/2\omega_2$ |
| **18.10.2** | $q=e^{i\pi\tau}=e^{-\pi K'/K}$ | $q=iq_2=ie^{i\pi\tau_2}=ie^{-\pi\lvert\omega_2'\rvert/2\omega_2}$ |
| **18.10.3** | | |
| | $q$ is real and since $g_3\geq 0(\lvert\omega'\rvert\geq\omega)$, $0<q\leq e^{-\pi}$ | $q$ is pure imaginary and since $g_3\geq 0(\lvert\omega_2'\rvert\geq\omega_2)$, $0<\lvert q\rvert\leq e^{-\pi/2}$ |

## 18.11 Expressing any Elliptic Function in Terms of $\wp$ and $\wp'$

If $f(z)$ is any elliptic function and $\wp(z)$ has same periods, write

**18.11.1** $$f(z)=\tfrac{1}{2}[f(z)+f(-z)]+\tfrac{1}{2}[\{f(z)-f(-z)\}\{\wp'(z)\}^{-1}]\wp'(z).$$

Since both brackets represent even elliptic functions, we ask how to express an even elliptic function $g(z)$ (of order $2k$) in terms of $\wp(z)$. Because of the evenness, an irreducible set of zeros can be denoted by $a_i$ $(i=1, 2, \ldots, k)$ and the set of points congruent to $-a_i$ $(i=1, 2, \ldots, k)$; correspondingly in connection with the poles we consider the points $\pm b_i$, $i=1, 2, \ldots, k$. Then

**18.11.2** $$g(z)=A\prod_{i=1}^{k}\left\{\frac{\wp(z)-\wp(a_i)}{\wp(z)-\wp(b_i)}\right\},$$ where $A$ is

a constant. If any $a_i$ or $b_i$ is congruent to the origin, the corresponding factor is omitted from the product. Factors corresponding to multiple poles (zeros) are repeated according to the multiplicity.

## 18.12. Case $\Delta=0 (c>0)$

Subcase I

**18.12.1** $g_2>0$, $g_3<0$: $(e_1=e_2=c,\ e_3=-2c)$

**18.12.2** $$H_1=H_2=0,\ H_3=3c$$

**18.12.3**
$$\wp(z;12c^2,-8c^3)=c+3c\{\sinh[(3c)^{\frac{1}{2}}z]\}^{-2}$$

**18.12.4**
$$\zeta(z;12c^2,-8c^3)=-cz+(3c)^{\frac{1}{2}}\coth[(3c)^{\frac{1}{2}}z]$$

**18.12.5**
$$\sigma(z;12c^2,-8c^3)=(3c)^{-\frac{1}{2}}\sinh[(3c)^{\frac{1}{2}}z]e^{-cz^2/2}$$

**18.12.6** $$\omega=\infty,\ \omega'=(12c)^{-\frac{1}{2}}\pi i$$

**18.12.7** $$\eta=\zeta(\omega)=-\infty$$

**18.12.8** $$\eta'=\zeta(\omega')=-c\omega'$$

**18.12.9** $$q=1,\qquad m=1$$

**18.12.10** $$\sigma(\omega)=0$$

**18.12.11** $$\sigma(\omega')=\frac{2\omega' e^{\pi^2/24}}{\pi}$$

**18.12.12** $$\sigma(\omega_2)=0$$

**18.12.13** $$\wp(\omega/2)=c$$

**18.12.14** $$\wp'(\omega/2)=0$$

**18.12.15** $$\zeta(\omega/2)=-\infty$$

**18.12.16** $$\sigma(\omega/2)=0$$

**18.12.17** $$\wp(\omega'/2)=-5c$$

**18.12.18** $$\wp'(\omega'/2)=\frac{-\pi^3}{2\omega'^3}$$

**18.12.19** $$\zeta(\omega'/2)=\tfrac{1}{2}(-c\omega'+\pi/\omega')$$

**18.12.20** $\sigma(\omega'/2)=\frac{\omega' e^{\pi^2/96}\sqrt{2}}{\pi}$

**18.12.21** $\wp(\omega_2/2)=c$

**18.12.22** $\wp'(\omega_2/2)=0$

**18.12.23** $\zeta(\omega_2/2)=-\infty-\frac{c\omega'}{2}$

**18.12.24** $\sigma(\omega_2/2)=0$

Subcase II

**18.12.25**

$$g_2>0,\ g_3>0:\ (e_1=2c,\ e_2=e_3=-c)$$

**18.12.26** $H_1=3c,\ H_2=H_3=0$

**18.12.27** $\wp(z;\,12c^2,\,8c^3)=-c+3c\{\sin[(3c)^{\frac{1}{2}}z]\}^{-2}$

**18.12.28**

$$\zeta(z;\,12c^2,\,8c^3)=cz+(3c)^{\frac{1}{2}}\cot[(3c)^{\frac{1}{2}}z]$$

**18.12.29**

$$\sigma(z;\,12c^2,\,8c^3)=(3c)^{-\frac{1}{2}}\sin[(3c)^{\frac{1}{2}}z]e^{cz^2/2}$$

**18.12.30** $\omega=(12c)^{-\frac{1}{2}}\pi,\ \omega'=i\infty$

**18.12.31** $\eta=\zeta(\omega)=c\omega$

**18.12.32** $\eta'=\zeta(\omega')=i\infty$

**18.12.33** $q=0,\qquad m=0$

**18.12.34** $\sigma(\omega)=\frac{2\omega e^{\pi^2/24}}{\pi}$

**18.12.35** $\sigma(\omega')=0$

**18.12.36** $\sigma(\omega_2)=0$

**18.12.37** $\wp(\omega/2)=5c$

**18.12.38** $\wp'(\omega/2)=\frac{-\pi^3}{2\omega^3}$

**18.12.39** $\zeta(\omega/2)=\frac{1}{2}(c\omega+\pi/\omega)$

**18.12.40** $\sigma(\omega/2)=\frac{e^{\pi^2/96}\omega\sqrt{2}}{\pi}$

**18.12.41** $\wp(\omega'/2)=-c$

**18.12.42** $\wp'(\omega'/2)=0$

**18.12.43** $\zeta(\omega'/2)=+i\infty$

**18.12.44** $\sigma(\omega'/2)=0$

**18.12.45** $\wp(\omega_2/2)=-c$

**18.12.46** $\wp'(\omega_2/2)=0$

**18.12.47** $\zeta(\omega_2/2)=\frac{c\omega}{2}+i\infty$

**18.12.48** $\sigma(\omega_2/2)=0$

Subcase III

**18.12.49** $g_2=0,\ g_3=0\,(e_1=e_2=e_3=0)$

**18.12.50** $\wp(z;\,0,\,0)=z^{-2}$

**18.12.51** $\zeta(z;\,0,\,0)=z^{-1}$

**18.12.52** $\sigma(z;\,0,\,0)=z$

**18.12.53** $\omega=-i\omega'=\infty$

## 18.13. Equianharmonic Case ($g_2=0$, $g_3=1$)

If $g_2=0$ and $g_3>0$, homogeneity relations allow us to reduce our considerations of $\wp$ to $\wp(z;\,0,\,1)$ ($\wp'$, $\zeta$ and $\sigma$ are handled similarly). Thus $\wp(z;0,g_3)=g_3^{1/3}\wp(zg_3^{1/6};0,1)$. The case $g_2=0$, $g_3=1$ is called the EQUIANHARMONIC case.

$\frac{1}{4}$ FPP; *Reduction to Fundamental Triangle*

$\Delta_1\equiv\Delta 0\omega_2 z_0$ is the Fundamental Triangle

Let $\epsilon$ denote $e^{i\pi/3}$ throughout **18.13.**

$\omega_2\approx 1.5299\ 54037\ 05719\ 28749\ 13194\ 17231$[6]

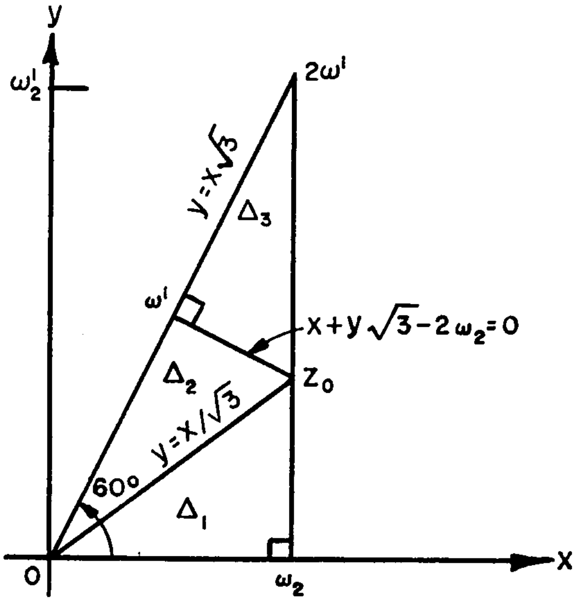

FIGURE 18.11

---

[6] This value was computed and checked by multiple precision on a desk calculator and is believed correct to 30S.

*Reduction for* $z_2$ *in* $\Delta_2$*:* $z_1=\epsilon\bar{z}_2$ is in $\Delta_1$.

**18.13.1** $$\wp(z_2)=\epsilon^{-2}\overline{\wp}(z_1)$$

**18.13.2** $$\wp'(z_2)=-\overline{\wp}'(z_1)$$

**18.13.3** $$\zeta(z_2)=\epsilon^{-1}\bar{\zeta}(z_1)$$

### Duplication Formulas

**18.13.29** $$\wp(2z)=\frac{\wp(z)[\wp^3(z)+2]}{4\wp^3(z)-1}$$

**18.13.30** $$\wp'(2z)=\frac{2\wp^6(z)-10\wp^3(z)-1}{[\wp'(z)]^3}$$

**18.13.31** $$\zeta(2z)=2\zeta(z)+\frac{3\wp^2(z)}{\wp'(z)}$$

**18.13.32** $$\sigma(2z)=-\wp'(z)\sigma^4(z)$$

### Trisection Formulas ($x$ real)

**18.13.33** $$\wp\left(\frac{x}{3}\right)=\frac{\sqrt[3]{\cos\frac{\phi-\pi}{3}}}{\sqrt[3]{\cos\frac{\phi}{3}}-\sqrt[3]{\cos\frac{\phi+\pi}{3}}}$$

**18.13.34** $$\wp'\left(\frac{x}{3}\right)=-\sqrt{3}\,\frac{\sqrt[3]{\cos\frac{\phi}{3}}+\sqrt[3]{\cos\frac{\phi+\pi}{3}}}{\sqrt[3]{\cos\frac{\phi}{3}}-\sqrt[3]{\cos\frac{\phi+\pi}{3}}}$$

where $\tan\phi=\wp'(x)$, $0<x<2\omega_2$ and we must choose $\phi$ in intervals

$$\left(-\frac{\pi}{2},\frac{\pi}{2}\right),\left(\frac{\pi}{2},\frac{3\pi}{2}\right),\left(\frac{3\pi}{2},\frac{5\pi}{2}\right)\text{ to get}$$

$$\wp\left(\frac{x}{3}\right),\wp\left(\frac{x}{3}+\frac{2\omega_2}{3}\right),\wp\left(\frac{x}{3}+\frac{4\omega_2}{3}\right),\text{ respectively.}$$

### Complex Multiplication

**18.13.35** $$\wp(\epsilon z)=\epsilon^{-2}\wp(z)$$

**18.13.36** $$\wp'(\epsilon z)=-\wp'(z)$$

**18.13.37** $$\zeta(\epsilon z)=\epsilon^{-1}\zeta(z)$$

**18.13.38** $$\sigma(\epsilon z)=\epsilon\sigma(z)$$

In the above, $\epsilon$ denotes (as it does throughout section **18.13**), $e^{i\pi/3}$. The above equations are useful as follows, e.g.:

If $z$ is real, $\epsilon z$ is on $0\omega'$ **(Figure 18.11)**; if $\epsilon z$ were purely imaginary, $z$ would be on $0z_0$ **(Figure 18.11).**

## Conformal Maps

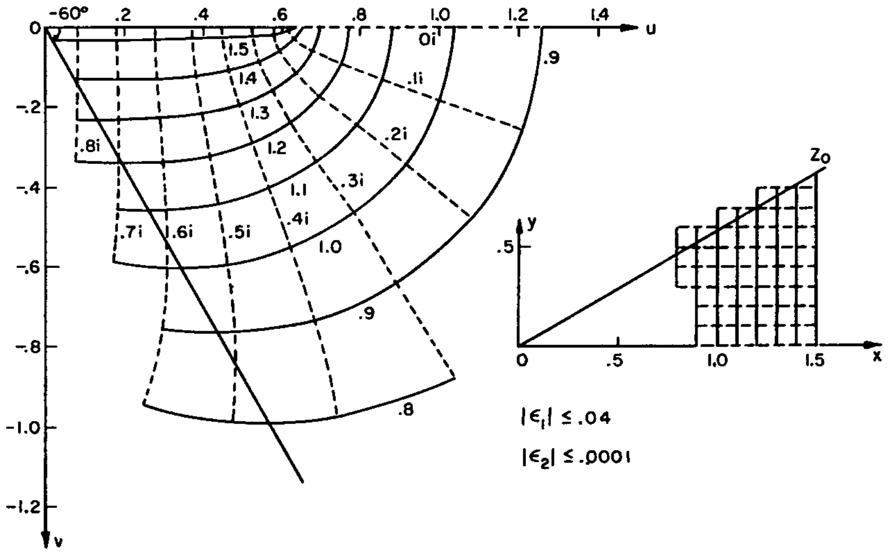
**Equianharmonic Case**

Map: $f(z)=u+iv$

$\wp(z)$

Near zero: $\wp(z)=\frac{1}{z^2}+\epsilon_1$

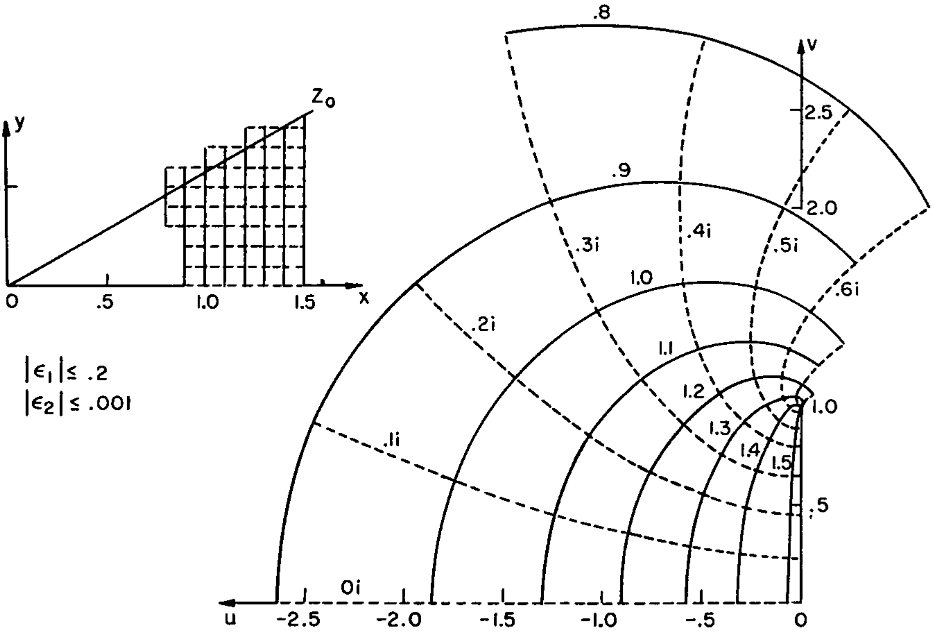
$\wp(z)=\frac{1}{z^2}+\frac{z^4}{28}+\epsilon_2$



$\wp'(z)$

Near zero: $\wp'(z)=\frac{-2}{z^3}+\epsilon_1$

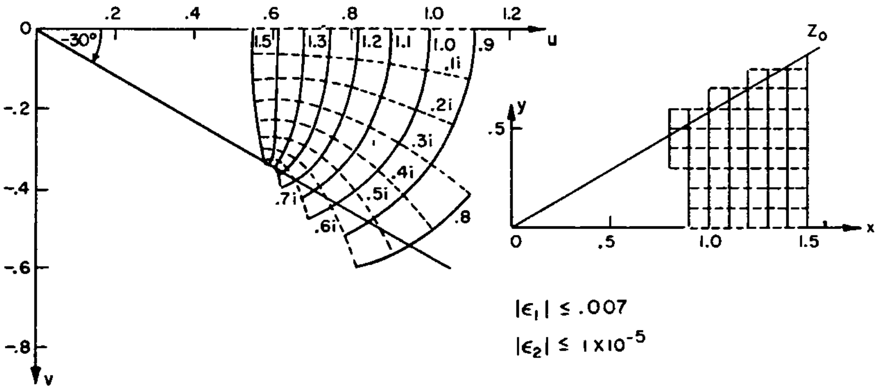
$$\wp'(z)=\frac{-2}{z^3}+\frac{z^3}{7}+\epsilon_2$$



$\zeta(z)$

Near zero: $\zeta(z)=\frac{1}{z}+\epsilon_1$

$$\zeta(z)=\frac{1}{z}-\frac{z^5}{140}+\epsilon_2$$



$\sigma(z)$

First 5 approximate values determined from exact values of $c_{3k}$; subsequent values determined by using exact ratios $c_{3k}/c_{3k-3}$, using at least double precision arithmetic with a desk calculator. All approximate $c$'s were checked with the use of the recursion relation; $c_3-c_{27}$ are believed correct to at least 21S; $c_{30}-c_{39}$ are believed correct to 20S.

$$c_{3k}\leq\frac{c_3}{13^{k-1}\cdot 28^{k-1}},\quad k=2,3,4,\ldots$$

### Other Series Involving $\wp$

#### Reversed Series for Large $|\wp|$

**18.13.39**

$$z=(\wp^{-1})^{1/2}\left[1+\frac{u}{7}+\frac{3u^2}{26}+\frac{5u^3}{38}+\frac{7u^4}{40}+\frac{63u^5}{248}+\frac{231u^6}{592}+\frac{429u^7}{688}+O(u^8)\right],$$

**18.13.40** where $u=\wp^{-3}/8$ and $z$ is in the Fundamental Triangle **(Figure 18.11)** if $\wp$ has an appropriate value.

#### Series near $z_0$

**18.13.41**

$$\wp=iu\left[1-\frac{u^6}{7}+\frac{3u^{12}}{364}\right]+u^4\left[-\tfrac{1}{2}+\frac{u^6}{28}\right]+O(u^{16})$$

**18.13.42**

$$u=-i\wp\left[1+\frac{\wp^3}{2}+\frac{6\wp^6}{7}+2\wp^9+\frac{70\wp^{12}}{13}+O(\wp^{15})\right],$$

**18.13.43** where $u=(z-z_0)$

#### Series near $\omega_2$

**18.13.44**

$$(\wp-e_2)=3e_2^2u\left[1+x+x^2+\frac{6}{7}x^3+\frac{5}{7}x^4+\frac{4}{7}x^5+\frac{285}{637}x^6+O(x^7)\right],$$

**18.13.45** where $u=(z-\omega_2)^2$, $x=e_2u$

**18.13.46**

$$u=e_2^{-1}\left[w-w^2+w^3-\frac{6}{7}w^4+\frac{3}{7}w^5+\frac{3}{7}w^6-\frac{1143}{637}w^7+O(w^8)\right],$$

**18.13.47** where $w=(\wp-e_2)/3e_2$

### Other Series Involving $\wp'$

#### Reversed Series for Large $|\wp'|$

**18.13.48**

$$z=2^{1/3}(\wp'^{1/3})^{-1}e^{i\pi/3}\left[1-\frac{2}{21}(\wp')^{-2}+\frac{5}{117}(\wp')^{-4}+O(\wp'^{-6})\right],$$

$z$ being in the Fundamental Triangle **(Figure 18.11)** if $\wp'$ has an appropriate value.

#### Series near $z_0$

**18.13.49**

$$(\wp'-i)=x\left[-2-ix+\frac{5}{14}x^2+\frac{3i}{28}x^3+O(x^4)\right]$$

**18.13.50** where $x=(z-z_0)^3$

**18.13.51** $$x=2\alpha\left[1-i\alpha-\frac{9}{7}\alpha^2+\frac{13i\alpha^3}{7}+O(\alpha^4)\right],$$

**18.13.52** where $\alpha=(\wp'-i)/(-4)$

**Series near $\omega_2$**

**18.13.53**

$$\wp'=6e_2^2(z-\omega_2)\left[1+2v+3v^2+\frac{24}{7}v^3+\frac{25}{7}v^4+\frac{24}{7}v^5+\frac{285}{91}v^6+O(v^7)\right],$$

**18.13.54** where $v=e_2(z-\omega_2)^2$

**18.13.55**

$$(z-\omega_2)=(\wp'/6e_2^2)\left[1-2w+9w^2-\frac{360}{7}w^3+330w^4-2268w^5+\frac{212058}{13}w^6+O(w^7)\right],$$

**18.13.56** where $w=\wp'^2/9$

## Other Series Involving $\zeta$

**Reversed Series for Large $|\zeta|$**

**18.13.57**

$$z=\zeta^{-1}\left[1-\frac{\gamma}{7}+\frac{17\gamma^2}{143}-\frac{496\gamma^3}{3553}+O(\gamma^4)\right],$$

**18.13.58** $\gamma=\zeta^{-6}/20$

**Series near $z_0$**

**18.13.59**

$$(\zeta-\zeta_0)=i\left[-\frac{u^2}{2}+\frac{u^8}{56}-\frac{3u^{14}}{5096}\right]+\left[\frac{u^5}{8}-\frac{u^{11}}{308}\right]+O(u^{17}),$$

**18.13.60** where $u=(z-z_0)$

**Series near $\omega_2$**

**18.13.61**

$$(\zeta-\eta_2)=-e_2(z-\omega_2)\left[1+v+\frac{3}{5}v^2+\frac{3}{7}v^3+\frac{2}{7}v^4+\frac{15}{77}v^5+\frac{12}{91}v^6+\frac{57}{637}v^7+O(v^8)\right],$$

**18.13.62** $v=e_2(z-\omega_2)^2$

**18.13.63**

$$(z-\omega_2)=\frac{(\zeta-\eta_2)}{-e_2}\left[1-w+\frac{12w^2}{5}-\frac{267w^3}{35}+\frac{139w^4}{5}-\frac{30192w^5}{275}+\frac{1634208}{3575}w^6+O(w^7)\right],$$

**18.13.64** $w=(\zeta-\eta_2)^2/e_2$

**Series Involving $\sigma$**

**18.13.65**

$$\sigma=z-\frac{2\cdot3}{7!}z^7-\frac{2^3\cdot3^3}{13!}z^{13}+\frac{2^6\cdot3^4\cdot23}{19!}z^{19}+\frac{2^7\cdot3^5\cdot5^2\cdot31}{25!}z^{25}+\frac{2^8\cdot3^8\cdot5\cdot9103}{31!}z^{31}-\frac{2^{12}\cdot3^9\cdot5\cdot229\cdot2683}{37!}z^{37}-\frac{2^{14}\cdot3^{10}\cdot5\cdot23\cdot257\cdot18049}{43!}z^{43}-\frac{2^{15}\cdot3^{12}\cdot5\cdot59\cdot107895773}{49!}z^{49}+O(z^{55})$$

**18.13.66**

$$z=\sigma+\frac{\sigma^7}{2^3\cdot3\cdot5\cdot7}+\frac{41\sigma^{13}}{2^7\cdot3^2\cdot5^2\cdot11\cdot13}+\frac{13\cdot337\sigma^{19}}{2^{10}\cdot3^4\cdot5^3\cdot11\cdot17\cdot19}+\frac{31\cdot101\sigma^{25}}{2^{15}\cdot3^5\cdot5\cdot11^2\cdot17\cdot23}+O(\sigma^{31})$$

**Economized Polynomials ($0\leq x\leq1.53$)**

**18.13.67** $x^2\wp(x)=\sum_0^6 a_nx^{6n}+\epsilon(x)$

$|\epsilon(x)|<2\times10^{-7}$

$a_0=(-1)9.99999\ 96$ $a_4=-(-9)2.20892\ 47$

$a_1=(-2)3.57143\ 20$ $a_5=(-10)1.74915\ 35$

$a_2=(-5)9.80689\ 93$ $a_6=-(-12)4.46863\ 93$

$a_3=(-7)2.00835\ 02$

**18.13.68** $x^3\wp'(x)=\sum_0^6 a_nx^{6n}+\epsilon(x)$

$|\epsilon(x)|<4\times10^{-7}$

$a_0=-2.00000\ 00$ $a_4=-(-9)2.12719\ 66$

$a_1=(-1)1.42857\ 22$ $a_5=(-10)6.53654\ 67$

$a_2=(-4)9.81018\ 03$ $a_6=-(-11)1.70510\ 78$

$a_3=(-6)3.00511\ 93$

**18.13.69** $x\zeta(x)=\sum_0^6 a_nx^{6n}+\epsilon(x)$

$|\epsilon(x)|<3\times10^{-8}$

$a_0=(-1)9.99999\ 98$ $a_4=(-10)6.12486\ 14$

$a_1=-(-3)7.14285\ 86$ $a_5=(-11)4.66919\ 85$

$a_2=-(-6)8.91165\ 65$ $a_6=(-12)1.25014\ 65$

$a_3=-(-8)1.44381\ 84$

## 18.14. Lemniscatic Case

$(g_2=1, g_3=0)$

If $g_2>0$ and $g_3=0$, homogeneity relations allow us to reduce our consideration of $\wp$ to $\wp(z; 1, 0)$ ($\wp'$, $\zeta$ and $\sigma$ are handled similarly). Thus $\wp(z; g_2, 0)=g_2^{\frac{1}{2}}\wp(zg_2^{\frac{1}{4}}; 1, 0)$. The case $g_2=1$, $g_3=0$ is called the LEMNISCATIC case.

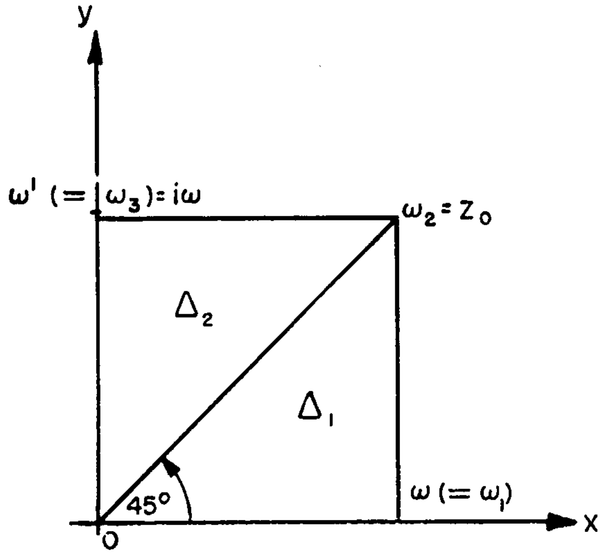

Figure 18.13

$\frac{1}{4}$FPP; *Reduction to Fundamental Triangle*

$\Delta_1\equiv\Delta 0\omega\omega_2$ is the Fundamental Triangle

$\omega\approx1.8540\ 74677\ 30137\ 192$[8]

*Reduction for* $z_2$ in $\Delta_2$: $z_1=i\bar{z}_2$ is in $\Delta_1$

**18.14.1** $$\wp(z_2)=-\overline{\wp}(z_1)$$

**18.14.2** $$\wp'(z_2)=i\overline{\wp'}(z_1)$$

**18.14.3** $$\zeta(z_2)=-i\bar{\zeta}(z_1)$$

**18.14.4** $$\sigma(z_2)=i\bar{\sigma}(z_1)$$

### Special Values and Formulas

**18.14.5**

$$\Delta=1,\ H_1=H_3=2^{-\frac{1}{4}},\ H_2=i/2,$$
$$m=\sin^2 45°=\tfrac{1}{2},\ q=e^{-\pi}$$

**18.14.6** $$\vartheta_2(0)=\vartheta_4(0)=(\omega\sqrt{2}/\pi)^{\frac{1}{2}};\ \vartheta_3(0)=(2\omega/\pi)^{\frac{1}{2}}$$

**18.14.7** $$\omega=K(\sin^2 45°)=\frac{\Gamma^2(\frac{1}{4})}{4\sqrt{\pi}}=\frac{\tilde{\omega}}{\sqrt{2}}\text{ where}$$

$\tilde{\omega}\approx2.62205\ 75542\ 92119\ 81046\ 48395\ 89891\ 11941\ 36827\ 54951\ 43162$ is the Lemniscate constant [18.9]

---

[8] This value was computed and checked by double precision methods on a desk calculator and is believed correct to 18S.

### Values at Half-periods

| | $\wp$ | $\wp'$ | $\zeta$ | $\sigma$ |
|---|---|---|---|---|
| **18.14.8** $\omega=\omega_1$ | $e_1=\frac{1}{2}$ | 0 | $\eta=\pi/4\omega$ | $e^{\pi/8}(2^{1/4})$ |
| **18.14.9** $\omega_2=z_0$ | $e_2=0$ | 0 | $\eta+\eta'$ | $e^{\pi/4}(\sqrt{2})e^{i\pi/4}$ |
| **18.14.10** $\omega'=\omega_3$ | $e_3=-\frac{1}{2}$ | 0 | $\eta'=-\pi i/4\omega$ | $ie^{\pi/8}(2^{1/4})$ |

### Values along (0, ω)

| | $\wp$ | $\wp'$ | $\zeta$ | $\sigma$ |
|---|---|---|---|---|
| **18.14.11** $\omega/4$ | $\frac{\sqrt{\alpha}}{2}(\sqrt{\alpha}+2^{1/4})(1+2^{1/4})$ | | | |
| **18.14.12** $\omega/2$ | $\alpha/2$ | $-\alpha$ | $\frac{\pi}{8\omega}+\frac{\alpha}{2\sqrt{2}}$ | $\frac{e^{\pi/32}(2^{1/16})}{\alpha^{\frac{1}{4}}}$ |
| **18.14.13** $2\omega/3$ | $\frac{1}{2}\sqrt{1+\sec 30°}$ | $-\frac{\sqrt[4]{2\sqrt{3}+3}}{\sqrt{3}}$ | $\frac{2\eta}{3}+\sqrt{\frac{\wp(2\omega/3)}{3}}$ | $\frac{e^{\pi/18}(3^{1/8})}{(2+\sqrt{3})^{1/12}}$ |
| **18.14.14** $3\omega/4$ | $\frac{\sqrt{\alpha}}{2}(\sqrt{\alpha}-2^{\frac{1}{4}})(1+2^{\frac{1}{4}})$ | | | |

$\alpha=1+\sqrt{2}$

**Values along** $(0, z_0)$

| | $\wp$ | $\wp'$ | $\zeta$ | $\sigma$ |
|---|---|---|---|---|
| **18.14.15**<br>$z_0/4$ | $-\frac{i}{2}(\alpha+\sqrt{2\alpha})$ | $\alpha(\sqrt{\alpha}+\sqrt{2})e^{i\pi/4}$ | | $\frac{e^{\pi/64}(2^{1/32})}{\alpha^{1/4}(\sqrt{\alpha}+\sqrt{2})^{1/4}}\,e^{i\pi/4}$ |
| **18.14.16**<br>$z_0/2$ | $-i/2$ | $e^{i\pi/4}$ | $\left[\frac{\pi}{4\omega\sqrt{2}}+\frac{1}{2}\right]e^{-i\pi/4}$ | $e^{\pi/16}(2^{1/8})e^{i\pi/4}$ |
| **18.14.17**<br>$2z_0/3$ | $\frac{-i}{2}\sqrt{\sec 30^\circ-1}$ | $\frac{e^{i\pi/4}\sqrt[4]{2\sqrt{3}-3}}{\sqrt{3}}$ | $\frac{2\eta_2}{3}+\left[\frac{\wp\,(2z_0/3)}{3}\right]^{1/2}$ | $\frac{e^{\pi/9}e^{i\pi/4}(3^{1/6})}{\sqrt[12]{2\sqrt{3}-3}}$ |
| **18.14.18**<br>$3z_0/4$ | $-\frac{i}{2}\,(\alpha-\sqrt{2\alpha})$ | $\alpha(\sqrt{\alpha}-\sqrt{2})e^{i\pi/4}$ | | $\frac{e^{9\pi/64}(2^{1/32})}{\alpha^{1/4}(\sqrt{\alpha}-\sqrt{2})^{1/4}}\,e^{i\pi/4}$ |

$\alpha=1+\sqrt{2}$

### Duplication Formulas

**18.14.19** $\wp(2z)$

$$=[\wp^2(z)+\tfrac{1}{4}]^2/\{\wp(z)[4\wp^2(z)-1]\}$$

**18.14.20**

$$\wp'(2z)=(\beta+1)(\beta^2-6\beta+1)/[32\wp'^3(z)],\quad \beta=4\wp^2(z)$$

**18.14.21** $$\zeta(2z)=2\zeta(z)+\frac{6\wp^2(z)-\frac{1}{2}}{2\wp'(z)}$$

**18.14.22** $$\sigma(2z)=-\wp'(z)\sigma^4(z)$$

### Bisection Formulas $(0<x<2\omega)$

**18.14.23**

$$\wp\left(\frac{x}{2}\right)$$
$$=[\wp^{\frac{1}{2}}(x)+\{\wp(x)+\tfrac{1}{2}\}^{\frac{1}{2}}]\,[\wp^{\frac{1}{2}}(x)\pm\{\wp(x)-\tfrac{1}{2}\}^{\frac{1}{2}}]$$

[Use + on $0<x\leq\omega$, − on $\omega\leq x<2\omega$]

**18.14.24**

$$\tfrac{1}{2}\wp'\left(\frac{x}{2}\right)=\wp'(x)\mp[2\wp(x)+\tfrac{1}{2}]\sqrt{\wp(x)-\tfrac{1}{2}}$$
$$-[2\wp(x)-\tfrac{1}{2}]\sqrt{\wp(x)+\tfrac{1}{2}}$$
$$-2\wp^{3/2}(x)\ \text{(See [18.13].)}$$

[Use − on $0<x\leq\omega$, + on $\omega\leq x<2\omega$]

### Complex Multiplication

**18.14.25** $$\wp(iz)=-\wp(z)$$

**18.14.26** $$\wp'(iz)=i\wp'(z)$$

**18.14.27** $$\zeta(iz)=-i\zeta(z)$$

**18.14.28** $$\sigma(iz)=i\sigma(z)$$

The above equations could be used as follows, e.g.: If $z$ were real, $iz$ would be purely imaginary.

## Conformal Maps

### Lemniscatic Case

Map: $f(z)=u+iv$

$\wp(z)$

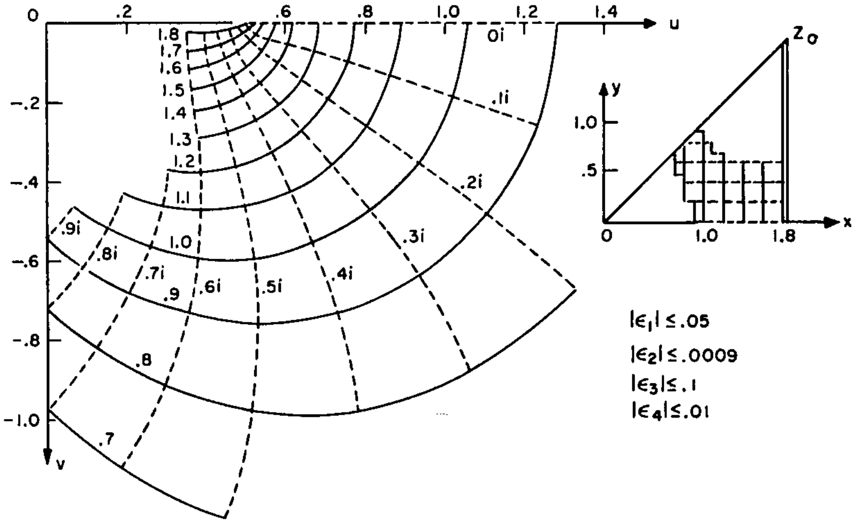
Near zero: $\wp(z)=\dfrac{1}{z^2}+\epsilon_1$

$$\wp(z)=\frac{1}{z^2}+\frac{z^2}{20}+\epsilon_2,\quad |z|<1$$

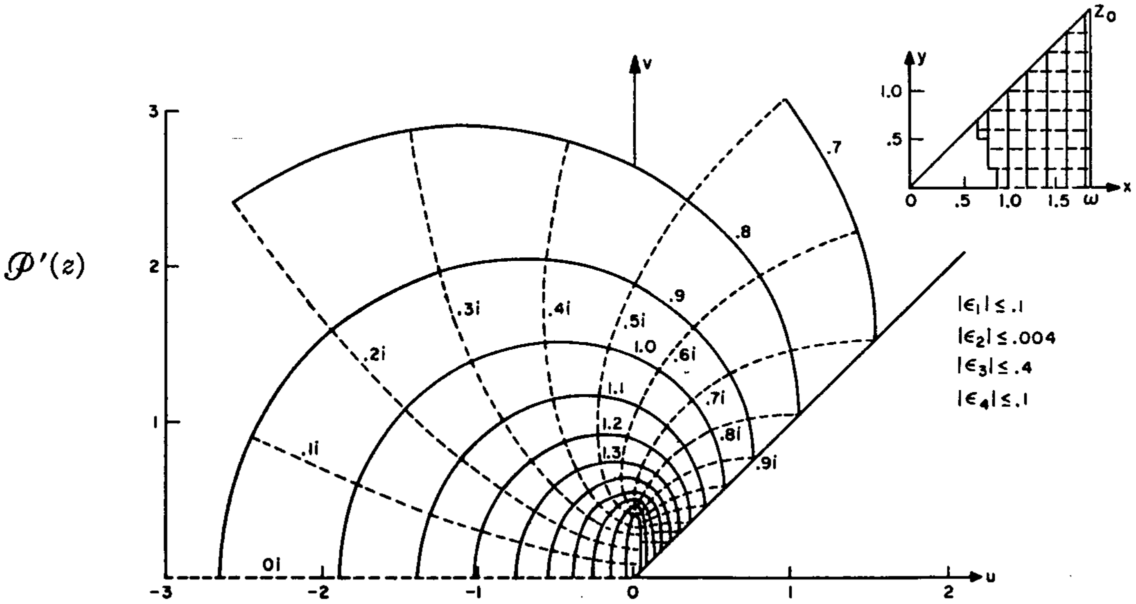
Near $z_0$: $\wp(z)=\dfrac{-(z-z_0)^2}{4}+\epsilon_3,$

$$|z-z_0|<\sqrt{2}$$

$$\wp(z)=\frac{-(z-z_0)^2}{4}+\frac{(z-z_0)^6}{80}+\epsilon_4$$



$|\epsilon_1|\leq .05$
$|\epsilon_2|\leq .0009$
$|\epsilon_3|\leq .1$
$|\epsilon_4|\leq .01$

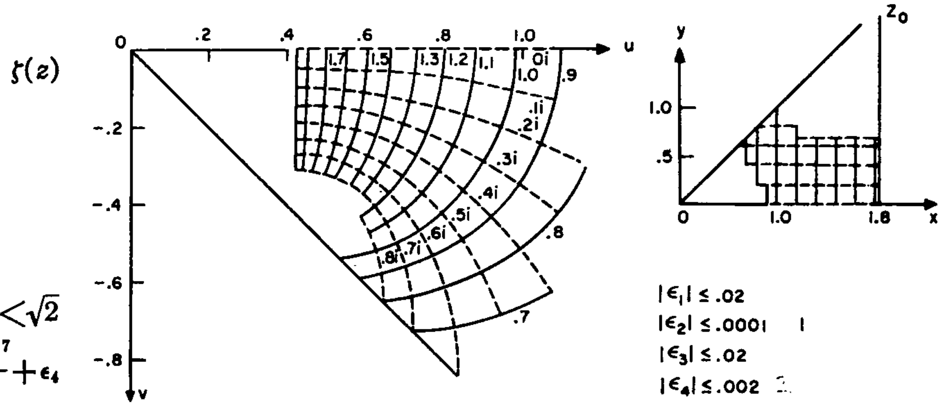


Near zero: $\wp'(z)=\frac{-2}{z^3}+\epsilon_1$

$$\wp'(z)=\frac{-2}{z^3}+\frac{z}{10}+\epsilon_2$$

Near $z_0$: $\wp'(z)=\frac{-(z-z_0)}{2}+\epsilon_3$

$$\wp'(z)=\frac{-(z-z_0)}{2}+\frac{3(z-z_0)^5}{40}+\epsilon_4$$



Near zero: $\zeta(z)=\frac{1}{z}+\epsilon_1$

$$\zeta(z)=\frac{1}{z}-\frac{z^3}{60}+\epsilon_2,\quad |z|<1$$

Near $z_0$: $\zeta(z)=\zeta_0+\frac{(z-z_0)^3}{12}+\epsilon_3,$

$$|z-z_0|<\sqrt{2}$$

$$\zeta(z)=\zeta_0+\frac{(z-z_0)^3}{12}-\frac{(z-z_0)^7}{560}+\epsilon_4$$

## Other Series Involving $\wp$

### Reversed Series for Large $|\wp|$

**18.14.29**

$$z=(\wp^{-1})^{1/2}\left[1+\frac{w}{5}+\frac{w^2}{6}+\frac{5w^3}{26}+\frac{35w^4}{136}+\frac{3w^5}{8}+\frac{231w^6}{400}+\frac{429w^7}{464}+\frac{195w^8}{128}+\frac{12155w^9}{4736}+\frac{46189w^{10}}{10496}+O(w^{11})\right],$$

**18.14.30** $w=\wp^{-2}/8$, and $z$ is in the Fundamental Triangle **(Figure 18.13)** if $\wp$ has an appropriate value.

### Series near $z_0$

**18.14.31** $$2\wp=-x+\frac{x^3}{5}-\frac{2x^5}{75}+\frac{x^7}{325}+O(x^9),$$

**18.14.32** $$x=(z-z_0)^2/2$$

**18.14.33** $$x=-\left[w+\frac{w^3}{5}+\frac{7w^5}{75}+\frac{11w^7}{195}+O(w^9)\right]$$

$$w=2\wp$$

### Series near $\omega$

**18.14.34**

$$(\wp-e_1)=v+v^2+\frac{4v^3}{5}+\frac{3v^4}{5}+\frac{32v^5}{75}+\frac{22v^6}{75}+\frac{64v^7}{325}+O(v^8),$$

**18.14.35** $$v=(z-\omega)^2/2$$

**18.14.36**

$$v=y\left[1-y+\frac{6y^2}{5}-\frac{8y^3}{5}+\frac{172y^4}{75}-\frac{52y^5}{15}+\frac{1064y^6}{195}+O(y^7)\right],$$

**18.14.37** $$y=(\wp-e_1)$$

## Other Series Involving $\wp'$

### Reversed Series for Large $|\wp'|$

**18.14.38**

$$z=Au\left[1-\frac{v}{5}+\frac{5v^3}{39}-\frac{7v^4}{51}+O(v^6)\right],\quad u=(\wp'^{1/3})^{-1}e^{i\pi/3},$$

**18.14.39** $A=2^{1/3}$, $v=Au^4/6$, and $z$ is in the Fundamental Triangle **(Figure 18.13)** if $\wp'$ has an appropriate value.

### Series near $z_0$

**18.14.40**

$$\wp'=\frac{1}{2}(z-z_0)\left[-1+3w-\frac{10w^2}{3}+\frac{35w^3}{13}+O(w^4)\right],$$

**18.14.41** $$w=(z-z_0)^4/20$$

**18.14.42**

$$(z-z_0)=2\wp'\left[1+\frac{3u}{5}+\frac{5u^2}{3}+\frac{84u^3}{13}+O(u^4)\right],$$

**18.14.43** $$u=4\wp'^4$$

### Series near $\omega$

**18.14.44**

$$\wp'=x\left[1+x^2+\frac{3}{5}x^4+\frac{3}{10}x^6+\frac{2}{15}x^8+\frac{11}{200}x^{10}+O(x^{12})\right],$$

**18.14.45** $$x=(z-\omega)$$

**18.14.46**

$$x=\wp'-\wp'^3+\frac{12\wp'^5}{5}-\frac{15\wp'^7}{2}+\frac{80\wp'^9}{3}-\frac{819\wp'^{11}}{8}+O(\wp'^{13})$$

## Other Series Involving $\zeta$

### Reversed Series for Large $|\zeta|$

**18.14.47** $$z=\zeta^{-1}\left[1-\frac{v}{5}+\frac{v^2}{7}-\frac{136v^3}{1001}+\frac{1349v^4}{9163}+O(v^5)\right],$$

**18.14.48** $$v=\zeta^{-4}/12$$

**Series near $z_0$**

**18.14.49**

$$(\zeta-\zeta_0)=\frac{1}{4}(z-z_0)^3\left[\frac{1}{3}-\frac{v}{7}+\frac{2v^2}{33}-\frac{v^3}{39}+O(v^4)\right],$$

**18.14.50** $$v=(z-z_0)^4/20$$

**Series near $\omega$**

**18.14.51**

$$(\zeta-\eta)=-\frac{x}{2}-\frac{x^3}{6}-\frac{x^5}{20}-\frac{x^7}{70}-\frac{x^9}{240}-\frac{x^{11}}{825}-\frac{11x^{13}}{31200}-\frac{x^{15}}{9750}+O(x^{17}),$$

**18.14.52** $$x=(z-\omega)$$

**18.14.53**

$$x=w-\frac{w^3}{3}+\frac{7w^5}{30}-\frac{13w^7}{63}+\frac{929w^9}{4536}-\frac{194w^{11}}{891}+\frac{942883w^{13}}{3891888}+O(w^{15})$$

**18.14.54** $w=-2(\zeta-\eta)$

**Series Involving $\sigma$**

**18.14.55**

$$\sigma=z-\frac{z^5}{2\cdot 5!}-\frac{3^2z^9}{2^2\cdot 9!}+\frac{3\cdot 23z^{13}}{2^3\cdot 13!}+\frac{3\cdot 107z^{17}}{2^4\cdot 17!}+\frac{3^3\cdot 7\cdot 23\cdot 37z^{21}}{2^5\cdot 21!}+\frac{3^2\cdot 313\cdot 503z^{25}}{2^6\cdot 25!}-\frac{3^4\cdot 7\cdot 685973z^{29}}{2^7\cdot 29!}+O(z^{33})$$

**18.14.56**

$$z=\sigma+\frac{\sigma^5}{2^4\cdot 3\cdot 5}+\frac{\sigma^9}{2^9\cdot 3\cdot 7}+\frac{17\cdot 113\sigma^{13}}{2^{13}\cdot 3^4\cdot 7\cdot 11\cdot 13}+\frac{122051\sigma^{17}}{2^{19}\cdot 3^5\cdot 7^2\cdot 11\cdot 17}+\frac{5\cdot 13\sigma^{21}}{2^{23}\cdot 3^2\cdot 11\cdot 19}+O(\sigma^{25})$$

**Economized Polynomials ($0\leq x\leq 1.86$)**

**18.14.57** $$x^2\wp(x)=\sum_0^6 a_nx^{4n}+\epsilon(x)$$

$$|\epsilon(x)|<2\times 10^{-7}$$

$a_0=(-1)9.99999\ 98$

$a_1=(-2)4.99999\ 62$

$a_2=(-4)8.33352\ 77$

$a_3=(-6)6.40412\ 86$

$a_4=(-8)4.81438\ 20$

$a_5=(-10)2.29729\ 21$

$a_6=(-12)4.94511\ 45$

**18.14.58** $$x^3\wp'(x)=\sum_0^6 a_nx^{4n}+\epsilon(x)$$

$$|\epsilon(x)|<4\times 10^{-7}$$

$a_0=-2.00000\ 00$

$a_1=(-1)1.00000\ 02$

$a_2=(-3)4.99995\ 38$

$a_3=(-5)6.41145\ 59$

$a_4=(-7)6.58947\ 52$

$a_5=(-9)5.59262\ 49$

$a_6=(-11)5.54177\ 69$

**18.14.59** $$x\zeta(x)=\sum_0^6 a_nx^{4n}+\epsilon(x)$$

$$|\epsilon(x)|<3\times 10^{-8}$$

$a_0=(-1)9.99999\ 99$

$a_1=-(-2)1.66666\ 74$

$a_2=-(-4)1.19036\ 70$

$a_3=-(-7)5.86451\ 63$

$a_4=-(-9)2.57492\ 62$

$a_5=-(-11)5.67008\ 00$

$a_6=(-13)9.70015\ 80$

---

## 18.15. Pseudo-Lemniscatic Case

### ($g_2=-1$, $g_3=0$)

If $g_2<0$ and $g_3=0$, homogeneity relations allow us to reduce our consideration of $\wp$ to $\wp(z; -1, 0)$. Thus

**18.15.1** $$\wp(z; g_2, 0)=|g_2|^{1/2}\wp(z|g_2|^{1/4}; -1, 0)$$

[$\wp'$, $\zeta$ and $\sigma$ are handled similarly]. Because of its similarity to the lemniscatic case, we refer to the case $g_2=-1$, $g_3=0$ as the pseudo-lemniscatic case. It plays the same role (period ratio unity) for $\Delta<0$ as does the lemniscatic case for $\Delta>0$.

$\omega_2=\sqrt{2}\times$ (real half-period for lemniscatic case)
$=\tilde{\omega}$ (the Lemniscate Constant—see **18.14.7**)

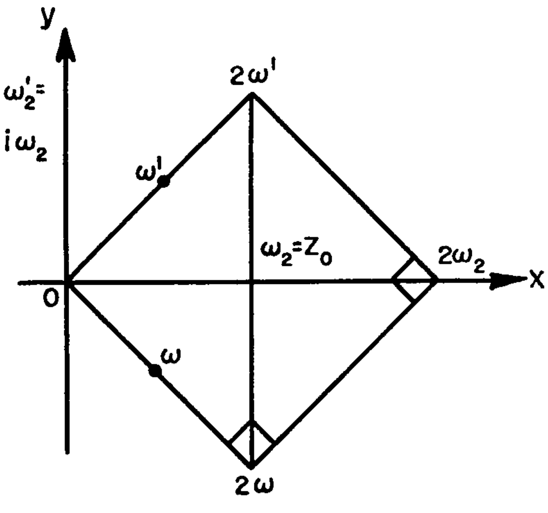

Figure 18.15

### Special Values and Relations

**18.15.2** $\Delta=-1,\ g_2=-1,\ g_3=0$

**18.15.3**

$H_1=-i/\sqrt{2},\ H_2=\tfrac{1}{2},\ H_3=i/\sqrt{2},\qquad m=\tfrac{1}{2},\ q=ie^{-\pi/2}$

**18.15.4**

$\vartheta_2(0)=R2^{1/4}e^{i\pi/8},\ \vartheta_3(0)=Re^{i\pi/8},\ \vartheta_4(0)=Re^{-i\pi/8},$

**18.15.5** where $R=\sqrt{\omega_2\sqrt{2}/\pi}$

### Values at Half-Periods

| | $\wp$ | $\wp'$ | $\zeta$ | $\sigma$ |
|---|---|---|---|---|
| **18.15.6** $\omega\equiv\omega_1$ | $i/2$ | 0 | $\tfrac{1}{2}(\eta_2-\eta_2')$ | $e^{-i\pi/4}e^{\pi/8}(2^{1/4})$ |
| **18.15.7** $\omega_2$ | 0 | 0 | $\eta_2=\pi/2\omega_2$ | $e^{\pi/4}\sqrt{2}$ |
| **18.15.8** $\omega'=\omega_3$ | $-i/2$ | 0 | $\tfrac{1}{2}(\eta_2+\eta_2')$ | $e^{i\pi/4}e^{\pi/8}(2^{1/4})$ |
| **18.15.9** $\omega_2'$ | 0 | 0 | $\eta_2'=-i\eta_2$ | $i\sigma(\omega_2)$ |

### Relations with Lemniscatic Values

**18.15.10** $\wp(z;\,-1,0)=i\wp(ze^{i\pi/4};\,1,0)$

**18.15.11** $\wp'(z;\,-1,0)=e^{3\pi i/4}\wp'(ze^{i\pi/4};\,1,0)$

**18.15.12** $\zeta(z;\,-1,0)=e^{i\pi/4}\zeta(ze^{i\pi/4};\,1,0)$

**18.15.13** $\sigma(z;\,-1,0)=e^{-i\pi/4}\sigma(ze^{i\pi/4};\,1,0)$

## Numerical Methods

### 18.16. Use and Extension of the Tables

**Example 1.** Lemniscatic Case

(a) Given $z=x+iy$ in the Fundamental Triangle, find $\wp\ (\wp',\zeta,\sigma)$ more accurately than can be done with the maps.

$\sigma$—Use Maclaurin series throughout the Fundamental Triangle. Five terms give at least six significant figures, six terms at least ten. $\wp$, $\zeta$—Use Laurent's series directly "near" 0, (if $|z|<1$, four terms give at least eight significant figures for $\wp$, nine for $\zeta$; five terms at least ten significant figures for $\wp$, eleven for $\zeta$). Use Taylor's series directly "near" $z_0$. Elsewhere (unless approximately seven or eight significant figures are insufficient) use economized polynomials to obtain $\wp(x)$, $\wp'(x)$ and/or $\zeta(x)$ as appropriate. To get $\wp(iy)$, $\wp'(iy)$ and/or $\zeta(iy)$, use Laurent's series for "small" $y$, otherwise use economized polynomials to compute $\wp(y)$, $\wp'(y)$ and/or $\zeta(y)$, then use complex multiplication to obtain $\wp(iy)$, $\wp'(iy)$ and/or $\zeta(iy)$. Finally, use appropriate addition formula to get $\wp(z)$ and/or $\zeta(z)$.

$\wp'$—Use Laurent's series directly "near" 0 (if $|z|<1$, four terms give at least six significant figures, five terms at least eight significant figures). Elsewhere, either use economized polynomials and addition formula as for $\wp$ and $\zeta$, or get $\wp'^2=4\wp^3-\wp$ and extract appropriate square root $(\mathscr{I}\wp'\geq 0)$.

(b) Given $\wp\ (\wp',\ \zeta,\ \sigma)$ corresponding to a point in the Fundamental Triangle, compute $z$ more accurately than can be done with the maps. Only a few significant figures are obtainable from the use of any of the given (truncated) reversed series, except in a small neighborhood of the center of the series. For greater accuracy, use inverse interpolation procedures.

**Example 2.** Equianharmonic Case

(a) Given $z=x+iy$ in the Fundamental Triangle, find $\wp\ (\wp',\ \zeta,\ \sigma)$ more accurately than can be done with the maps.

$\sigma$—Use Maclaurin series throughout the Fundamental Triangle. Four terms give at least eleven significant figures, five terms at least twenty one.

$\wp$,$\zeta$—Use Laurent's series directly "near" 0 (if $|z|<1$, four terms give at least 10S for $\wp$, 11S for $\zeta$; five terms at least 13S for $\wp$, 14S for $\zeta$). Elsewhere (unless approximately seven or eight significant figures are insufficient) use economized polynomials to obtain $\wp(x)$, $\wp'(x)$ and/or $\zeta(x)$, as appropriate. To get $\wp(iy)$, $\wp'(iy)$ and/or $\zeta(iy)$, use Laurent's series. Then use appropriate addition formula to get $\wp(z)$ and/or $\zeta(z)$.

$\wp'$—Use Laurent's series directly "near" 0 (if $|z|<1$, four terms give at least 8S, five terms at least 11S). Elsewhere, either proceed as for $\wp$ and $\zeta$, or get $\wp'^2=4\wp^3-1$ and extract appropriate square root $(\mathscr{I}\wp'\geq 0)$.

(b) Given $\wp(\wp',\zeta,\sigma)$ corresponding to a point in the Fundamental Triangle, compute $z$ more accurately than can be done with the maps. Only a few significant figures are obtainable from the use of any of the given (truncated) reversed series, except in a small neighborhood of the center of the series. For greater accuracy, use inverse interpolation procedures.

**Example 3.** Given period ratio $a$, find parameters $m$ (of elliptic integrals and Jacobi's functions of chapter **16**) and $q$ (of $\vartheta$ functions).

$m$—In both the cases $\Delta>0$ and $\Delta<0$, the period ratio is equal to $K'(m)/K(m)$ (see **18.9**). Knowing $K'/K$, if $1<K'/K\leq 3$, use **Table 17.3** to find $m$; if $K'/K>3$, use the method of **Example 6** in chapter **17.** An alternative method is to use **Table 18.3** to obtain the necessary entries, thence use

$$m=(e_2-e_3)/(e_1-e_3) \text{ in case } \Delta>0,$$

$$m=\tfrac{1}{2}-3e_2/4H_2 \text{ in case } \Delta<0.$$

$q$—In both the cases $\Delta>0$ and $\Delta<0$, the period ratio determines the exponent for $q[q=e^{-\pi a}$ if $\Delta>0$, $q=ie^{-\pi a/2}$ if $\Delta<0]$. Hence enter **Table 4.16** $[e^{-\pi x}$, $x=0(.01)1]$ and multiply the results as appropriate [e.g., $e^{-4.72\pi}=(e^{-\pi})^4(e^{-.72\pi})$].

### Determination of Values at Half-Periods, Invariants and Related Quantities from Given Periods (Table 18.3)

$\Delta>0$

Given $\omega$ and $\omega'$, form $\omega'/i\omega$ and enter **Table 18.3.** Multiply the results obtained by the appropriate power of $\omega$ (see footnotes of **Table 18.3**) to obtain value desired.

**Example 4.**

Given $\omega=10$, $\omega'=11i$, find $e_i$, $g_i$, and $\Delta$.

Here $\omega'/i\omega=1.1$, so that direct reading of **Table 18.3** gives

$$e_1(1)=1.6843\ 041$$
$$e_2(1)=-.2166\ 258\ (=-e_1-e_3)$$
$$e_3(1)=-1.4676\ 783$$
$$g_2(1)=10.0757\ 7364$$
$$g_3(1)=2.1420\ 1000.$$

Multiplying by appropriate powers of $\omega=10$ we obtain

$$e_1=.01684\ 3041$$
$$e_2=-.00216\ 6258$$
$$e_3=-.01467\ 6783$$
$$g_2=1.0075\ 77364\times 10^{-3}$$
$$g_3=2.1420\ 1000\times 10^{-6}$$

whence

$$\Delta=8.9902\ 3191\times 10^{-10}$$

$\Delta<0$

Given $\omega_2$ and $\omega_2'$, form $\omega_2'/i\omega_2$ and enter **Table 18.3.** Multiply the results obtained by the appropriate power of $\omega_2$ (see footnotes of **Table 18.3**) to obtain value desired.

**Example 4.**

Given $\omega_2=10$, $\omega_2'=11i$, find $e_i$, $g_i$, and $\Delta$.

Here $\omega_2'/i\omega_2=1.1$, so that direct reading of **Table 18.3** gives

$$e_1(1)=-.2166\ 2576+3.0842\ 589i$$
$$e_2(1)=.4332\ 5152=-2\mathscr{R}(e_1)$$
$$e_3(1)=\bar{e}_1(1)$$
$$g_2(1)=-37.4874\ 912$$
$$g_3(1)=16.5668\ 099.$$

Multiplying by appropriate powers of $\omega_2=10$ we obtain

$$e_1=-.00216\ 62576+.03084\ 2589i$$
$$e_2=.00433\ 25152$$
$$e_3=\bar{e}_1$$
$$g_2=-3.7487\ 4912\times 10^{-3}$$
$$g_3=1.6566\ 8099\times 10^{-5}$$

whence

$$\Delta=-6.0092\ 019\times 10^{-8}$$

**Example 5.** $(\Delta>0)$

Given $\omega=10$, $\omega'=55i$, find $\eta$, $\eta'$, $\sigma(\omega)$, $\sigma(\omega')$ and $\sigma(\omega_2)$.

Forming $\omega'/i\omega=5.5$ and entering **Table 18.3** we obtain $\eta=.82246704$, $\sigma(\omega)=.96045\ 40$. Using Legendre's relation we find $\eta'=\eta\omega'-\pi i/2=2.9527\ 723i$. Since interpolation for $\sigma(\omega')$ and $\sigma(\omega+\omega')$ is difficult, use is made of **18.3.15–18.3.17** together with **18.3.4** and **18.3.6.** Values of $g_2$, $g_3$ and $e_1$ can be read directly to eight significant figures and $e_3$ to about five significant figures giving $g_2=8.1174\ 243$, $g_3=4.4508\ 759$, $e_1=1.6449\ 341$, and $e_3=-.82247$. Use of **18.3.6** yields $H_3=.00174\ 69$ and $H_2=.00174\ 69i$. Application of **18.3.15–18.3.17** yields $\sigma(\omega')/i=.0071177$ and $\sigma(\omega_2)=-.002016-.01055i$. Multiplying the results obtained by the appropriate powers of $\omega$ we obtain $\eta=.08224\ 6704$, $\eta'=.29527\ 723i$, $\sigma(\omega)=9.6045\ 40$, $\sigma(\omega')=.071177i$ and $\sigma(\omega_2)=-.02016-.1055i$.

**Example 5.** $(\Delta<0)$

Given $\omega_2=1000$, $\omega_2'=1004i$, find $\eta_2$, $\eta_2'$, $\sigma(\omega_2)$, $\sigma(\omega_2')$ and $\sigma(\omega')$.

With $\omega_2'/i\omega_2=1.004$, four point interpolation in **Table 18.3** gives $\eta_2=1.5626\ 756$, $\eta_2'=-1.5726\ 664i$, $\sigma(\omega_2)=1.1805\ 028$, $\sigma(\omega_2')=1.1901\ 52i$ and $\sigma(\omega')=.475084+.476717i$.

Multiplying the results obtained by the appropriate powers of $\omega_2$ gives $\eta_2=.00156\ 26756$, $\eta_2'=-.00157\ 26664i$, $\sigma(\omega_2)=1180.5028$, $\sigma(\omega_2')=1190.152i$ and $\sigma(\omega')=475.084+476.717i$.

### Determination of Periods from Given Invariants (Table 18.1.)

$\Delta>0$

Given $g_2>0$ and $g_3>0$ such that $\Delta=g_2^3-27g_3^2>0$ (if $g_3=0$, $|\omega'|=\omega$; see lemniscatic case), compute $\bar{g}_2=g_2g_3^{-2/3}$. From **Table 18.1**, determine $\omega g_3^{1/6}$ and $\omega' g_3^{1/6}$, thence $\omega$ and $\omega'$.

**Example 6.**

Given $g_2=10$, $g_3=2$, find $\omega$ and $\omega'$. With $\bar{g}_2=g_2g_3^{-2/3}=6.2996\ 05249$, from **Table 18.1** $\omega g_3^{1/6}=1.1267\ 806$ and $\omega' g_3^{1/6}=1.2324\ 295i$ whence $\omega=1.003847$ and $\omega'=1.097970i$.

**Example 7.**

Given $g_2=8$, $g_3=4$, find $\omega$ and $\omega'$. With $\bar{g}_2=g_2g_3^{-2/3}=3.1748\ 02104$, from **Table 18.1** $\omega g_3^{1/6}=1.2718\ 310$ and $\omega' g_3^{1/6}=1.8702\ 425i$ whence $\omega=1.009453$ and $\omega'=1.484413i$.

$\Delta<0$

Given $g_2$ and $g_3>0$ such that $\Delta=g_2^3-27g_3^2<0$ (if $g_3=0$, $|\omega_2'|=\omega_2$; see pseudo-lemniscatic case), compute $\bar{g}_2=g_2g_3^{-2/3}$. From **Table 18.1**, determine $\omega_2 g_3^{1/6}$ and $\omega_2' g_3^{1/6}$, thence $\omega_2$ and $\omega_2'$.

**Example 6.**

Given $g_2=-10$, $g_3=2$, find $\omega_2$ and $\omega_2'$. With $\bar{g}_2=g_2g_3^{-2/3}=-10/1.5874\ 0105=-6.2996\ 053$, from **Table 18.1** $\omega_2g_3^{1/6}=1.5741\ 349$ and $\omega_2'g_3^{1/6}=1.7124\ 396i$ whence $\omega_2=1.40239\ 48$ and $\omega_2'=1.52561\ 02i$.

**Example 7.**

Given $g_2=7$, $g_3=6$, find $\omega_2$ and $\omega_2'$.
With $\bar{g}_2=g_2g_3^{-2/3}=7/3.3019\ 2725=2.119974$, from **Table 18.1** $\omega_2g_3^{1/6}=1.3423\ 442$ and $\omega_2'g_3^{1/6}=3.1441\ 141i$ whence $\omega_2=.99579\ 976$ and $\omega_2'=2.33241\ 83i$.

### Computation of $\wp$, $\wp'$, or $\zeta$ for Given $z$ and Arbitrary $g_2$, $g_3$

(or arbitrary periods from which $g_2$ and $g_3$ can be computed—
in any case, periods must be known, at least approximately)

First reduce the problem (if necessary) to computation for a point $z$ in the Fundamental Rectangle by use of appropriate results from **18.2.**

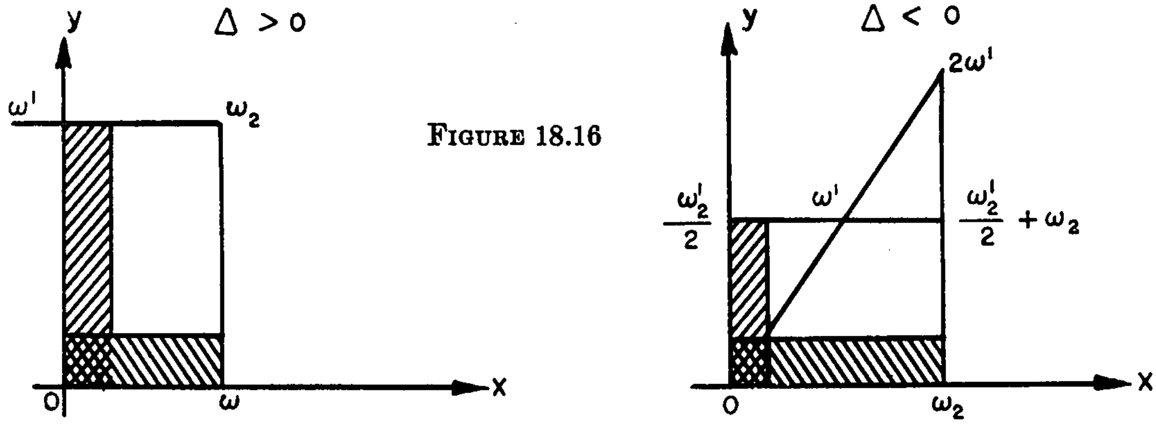

FIGURE 18.16

**Method 1** (as accurate as desired)

If both $x$ and $y$ are "small," (point in double-cross hatched region) use Laurent's series in $z$ directly. If either $x$ or $y$ is "large," use Laurent's series on $0x$, then on $0y$ and finally use an addition formula. (For $\wp'$ an alternative is to get $\wp$, then compute the appropriate root of $\wp'^2=4\wp^3-g_2\wp-g_3$; see **18.8.**)

$\Delta>0$

**Method 2** (for $\wp$ or $\wp'$ only)

Compute $e_i (i=1,2,3)$ (if only $g_2$, $g_3$ are given use **Table 18.1** to get the periods, then get $e_i$ in **Table 18.3;** if periods are also given, use **Table 18.3** directly). In any case, obtain $m(=[e_2-e_3]/[e_1-e_3])$, thence Jacobi's functions $\operatorname{sn}(z^*|m)$, $\operatorname{cn}(z^*|m)$, $\operatorname{dn}(z^*|m)$, from **16.4** and **16.21** and $\wp$ or $\wp'$ from **18.9.11–18.9.12.**

**Method 3** (accuracy limited by **Table 4.16** of $e^{-\pi x}$ and by the method of getting periods).

Obtain periods, their ratio $a$, then $q=e^{-\pi a}$ from **Table 4.16.** Hence get $\vartheta_i(0)$, $i=2,3,4$ from truncated series **18.10.21–.23.** Compute appropriate $\vartheta$ functions for $z=x$ and for $z=iy$, whence get $\wp(x)$, $\wp'(x)$ and/or $\zeta(x)$, $\wp(iy)$, $\wp'(iy)$ and/or $\zeta(iy)$, then use an addition formula (if either $x$ or $y$ is "small", it is probably easier to use Laurent's series).

**Example 8.** Given $z=.07+.1i$, $g_2=10$, $g_3=2$, find $\wp$.

Using Laurent's series directly with

$$\begin{aligned}
c_2&=.5\\
c_3&=.07142\ 85714\\
c_4&=.08333\ 33333\\
c_5&=.00974\ 02597\\
z^{-2}&=-22.97193\ 820-63.06022\ 25i\\
+c_2z^2&=-\phantom{22}.00255\ 000+\phantom{63}.00700\ 00i\\
+c_3z^4&=-\phantom{22}.00001\ 214-\phantom{63}.00001\ 02i\\
+c_4z^6&=+\phantom{22}.00000\ 024-\phantom{63}.00000\ 01i
\end{aligned}$$

---

$$\wp(z)=-22.97450\ 010-63.05323\ 28i.$$

**Example 9.** Given $z=15+73i$, $g_2=8$, $g_3=4$, find $\wp$. From **Example 7**, $\omega=1.009453$, $\omega'=1.484413i$. From **Table 18.3**, $e_1=1.61803\ 37$, $e_3=-.99999\ 96$, whence $m=.14589\ 79$. From **18.2.18** with $M=7$ and $N=24$, $\wp(.867658+1.748176i)=\wp(15+73i)$. Since $z$ lies in $R_2$, by **18.2.31** $\wp(15+73i)=\overline{\wp}(.867658+1.22065i)$. From **16.4** with $z^*=1.40390+1.97505i$, $\operatorname{sn}(z^*|m)=2.46550+1.96527i$. Using **18.9.11**, $\wp(15+73i)=-.57743+.067797i$.

$\Delta<0$

**Method 2** (for $\wp$ or $\wp'$ only)

Compute $e_2$ and $H_2$ (if only $g_2$,$g_3$ are given, use **Table 18.1** to get the periods, then get $e_i$ in **Table 18.3;** if periods are also given use **Table 18.3** directly). In any case, obtain $m(=\frac{1}{2}-3e_2/4H_2)$ thence Jacobi's functions $\operatorname{sn}(z'|m)$, $\operatorname{cn}(z'|m)$, $\operatorname{dn}(z'|m)$, from **16.4** and **16.21** and $\wp$ or $\wp'$ from **18.9.11–18.9.12.**

**Method 3** (accuracy limited as in the case $\Delta>0$).

Obtain periods, their ratio $a$, thence $q_2=e^{-\pi a/2}$ from **Table 4.16.** Then proceed as in the case $\Delta>0$, using corresponding formulas.

**Example 8.** Given $z=.1+.03i$, $g_2=-10$, $g_3=2$, find $\wp$.

Using Laurent's series directly with

$$\begin{aligned}
c_2&=-.5\\
c_3&=.07142\ 85714\\
c_4&=.80333\ 33333\\
z^{-2}&=76.59287\ 938-50.50079\ 960i\\
c_2z^2&=-.00455\ 000-\phantom{50}.00300\ 000i\\
c_3z^4&=+.00000\ 334+\phantom{50}.00000\ 780i\\
c_4z^6&=-.00000\ 002+\phantom{50}.00000\ 011i
\end{aligned}$$

---

$$\wp(z)=76.58833\ 270-50.50379\ 169i.$$

**Example 9.** Given $z=1.75+3.6i$, $g_2=7$, $g_3=6$, find $\wp$. From **Example 7,** $\omega_2=.99579\ 98$, $\omega_2'=2.33241\ 83i$. Using **18.2.18** with $M=1$, $N=1$, $\wp(1.75+3.6i)=\wp(-.24159\ 96-1.064836i)=\wp(.24159\ 96+1.0648\ 36i)$. With $\Delta<0$ from **Table 18.3**, $e_1=-.81674\ 362+.50120\ 90i$, $e_2=1.63348\ 724$, $e_3=-.81674\ 362-.50120\ 90i$ whence $m=.01014\ 3566$, $H_2^{\frac{1}{2}}=1.58144\ 50$, so that $z'=2zH_2^{\frac{1}{2}}=.76415\ 29+3.367959i$. From **16.4,** $\operatorname{cn}(z'|m)=4.00543\ 66-12.32465\ 69i$. Applying **18.9.11**, $\wp(1.75+3.6i)=-.960894-.383068i$.

$\Delta>0$

**Example 10.** Given $\omega=10$, $\omega'=20i$, find $\zeta(9+19i)$ by use of theta functions, **18.10** and addition formulas.

For the period ratio $a=\omega'/\omega i=2$ with the aid of **Table 4.16,** $q=e^{-2\pi}=.00186\ 74427$.

Using the truncated approximations **18.10.21–18.10.23** we compute the theta functions for argument zero. Using **16.27.1–16.27.4** we compute the theta functions for arguments $v$ where $z=x$ and $z=iy$. Then, with **18.10.5–18.10.7** together with **18.10.9** and **18.10.18** we obtain $\zeta(9)=.09889\ 5484$, $\zeta(19i)=-.00120\ 0155i$, $\wp(9)=.01706\ 9647$, $\wp'(9)=-.00125\ 8460$, $\wp(19i)=-.00861\ 2615$, $\wp'(19i)=-.00003\ 757i$. Using the addition formula **18.4.3,** we obtain $\zeta(9+19i)=.07439\ 49-.00046\ 88i$.

$\Delta<0$

**Example 10.** Given $\omega_2=5$, $\omega_2'=7i$ find $\wp'(3+2i)$ by use of theta functions, **18.10** and addition formulas.

With the use of **Table 4.16** and **18.10.2,** $q=ie^{-.7\pi}=.11090\ 12784i$.

The theta functions are computed for argument zero using **18.10.21–18.10.23** and the theta functions for arguments $v_1$ and $v_2$ corresponding to $z=z_1+z_2$ using **16.27.1–16.27.4.** Using **18.10.5–18.10.6** together with **18.10.10,** we find $\wp(3)=.10576\ 946$, $\wp(2i)=-.24497\ 773$, $\wp'(3)=-.07474140$, $\wp'(2i)=-.25576\,007i$. The addition formula **18.4.1** yields $\wp(3+2i)=.01763\ 210-.07769\ 187i$, and **18.4.2** yields $\wp'(3+2i)=-.00069\ 182+.04771\ 305i$.

### Use of Table 18.2 in Computing $\wp$, $\wp'$, $\zeta$ for Special Period Ratios

If the problem is reduced to computing $\wp$, $\wp'$, $\zeta$ in the Fundamental Rectangle for the case when the real half-period is unity and pure imaginary half-period is $ia$, for certain values of $a$ **Table 18.2** may be used. Consider $\wp$ as an example. If $|z|$ is "small", then use Laurent's series directly for $\wp(z)$ [invariants for use in the series are given in **Table 18.3**].

If $x$ is "large" and $y$ "small" use **Table 18.2** to obtain $x^2\wp(x)$ and $x^3\wp'(x)$, thence $\wp(x)$ and $\wp'(x)$; use Laurent's series to obtain $\wp(iy)$ and $\wp'(iy)$; finally, use addition formula **18.4.1.**

For $x$ "small" and $y$ "large", reverse the procedure. For both $x$ and $y$ "large," use **Table 18.2** to obtain $\wp(x)$, $\wp'(x)$, $\wp(iy)$ and $\wp'(iy)$, thence use addition formula **18.4.1.**

Similar procedures apply to $\wp'$ or $\zeta$. For $\wp'$, one can also first obtain $\wp$, then compute $\wp'^2=4\wp^3-g_2\wp-g_3$ and extract the appropriate square root (see **18.8** re choice of sign for $\wp'$).

$\Delta>0$

**Example 11.** Compute $\wp(.8+i)$ when $a=1.2$. Using **Table 18.2** or Laurent's series **18.5.1–4** with
$g_2=9.15782\ 851$ and
$g_3=3.23761\ 717$ from **Table 18.3,**
$\wp(.8)=1.92442\ 11$,
$\wp'(.8)=-2.76522\ 05$,
$\wp(i)=-1.40258\ 06$ and
$\wp'(i)=-1.19575\ 58i$. Using the addition formula **18.4.1**
$\wp(.8+i)=-.381433-.149361i$.

**Example 12.** Compute $\zeta(.02+3i)$ for $a=4$. Using **Table 18.2** or Laurent's series **18.5.1–5** with

$$g_2=8.11742\ 426$$
$$g_3=4.45087\ 587$$

from **Table 18.3,**

$$\zeta(.02)=49.99999\ 89,$$
$$\wp(.02)=2500.00016,$$
$$\wp'(.02)=-249999.98376,$$
$$\zeta(3i)=.89635\ 173i,$$
$$\wp(3i)=-.82326\ 511,$$
$$\wp'(3i)=-.00249\ 829i.$$

Applying the addition formula **18.4.3,**

$$\zeta(.02+3i)=.016465+.89635i.$$

$\Delta<0$

**Example 11.** Compute $\wp(.9+.1i)$ for $a=1.05$. Using **Table 18.2** or Laurent's series **18.5.1–4** with
$g_2=-42.41653\ 54$ and
$g_3=9.92766\ 62$ from **Table 18.3,**
$\wp(.9)=.34080\ 33$,
$\wp'(.9)=-2.164801$,
$\wp(.1i)=-99.97876$,
$\wp'(.1i)=-2000.4255i$. With the addition formula **18.4.1**
$\wp(.9+.1i)=.231859-.215149i$.

**Example 12.** Compute $\wp'(.4+.9i)$ for $a=2$. Using **Table 18.2** or Laurent's series **18.5.1–4,** with

$$g_2=4.54009\ 85,$$
$$g_3=8.38537\ 94$$

from **Table 18.3,**

$$\wp(.4)=6.29407\ 07,$$
$$\wp'(.4)=-30.99041,$$
$$\wp(.9i)=-1.225548,$$
$$\wp'(.9i)=-3.19127\ 03i.$$

Using the addition formulas **18.4.1–2,**

$$\wp'(.4+.9i)=1.10519\ 76-.56489\ 00i.$$

### Computation of $\sigma$ for Given $z$ and Arbitrary $g_2$ and $g_3$

(or periods from which $g_2$ and $g_3$ can be computed—in any case, periods must be known, at least approximately)

First reduce the problem (if necessary) to computation for a point $z$ in the Fundamental Rectangle (see **18.2**). After final reduction let $z$ denote the point obtained.

$\Delta>0$

If $\mathscr{R}z>\omega/2$ or,

$\mathscr{I}z>\omega'/2$, use duplication formula

$$\sigma(z)=-\wp'(z/2)\sigma^4(z/2),$$

obtaining $\sigma(z/2)$ by use of Maclaurin series for $\sigma$ and $\wp'(z/2)$ by method explained above. Otherwise, simply use Maclaurin series for $\sigma$ directly.

$\Delta<0$

If $\mathscr{R}z>\omega_2/2$ or

$\mathscr{I}z>\omega_2'/4$, use duplication formula as in case $\Delta>0$. Otherwise, use Maclaurin series for $\sigma$ directly.

An alternate method is to use theta functions **18.10** first computing $q$ and $\vartheta_i(0)$, $i=2, 3, 4$.

$\Delta>0$

**Example 13.** Compute $\sigma(.4+1.3i)$ for $g_2=8$, $g_3=4$. From **Example 7**, $\omega=1.009453$ and $\omega'=1.484413i$. Since $\mathscr{I}z>\omega'/2$, the Maclaurin series **18.5.6** is used to obtain $\sigma(z/2)=\sigma(.2+.65i)=.19543\,86+.64947\,28i$, the Laurent series **18.5.4** to obtain $\wp'(.2+.65i)=5.02253\,80-3.56066\,93i$. The duplication formula **18.4.8** gives $\sigma(.4+1.3i)=.278080+1.272785i$.

$\Delta<0$

**Example 13.** Compute $\sigma(.8+.4i)$ for $g_2=7$, $g_3=6$. From **Example 7**, $\omega_2=.99579\,976$, $\omega_2'=2.33241\,83i$. Since $\mathscr{R}z>\omega_2/2$, the Maclaurin series **18.5.6** is used to obtain $\sigma(z/2)=\sigma(.4+.2i)=.40038\,019+.19962\,017i$, the Laurent series **18.5.4** to obtain $\wp'(.4+.2i)=-3.70986\,70+22.218544i$. The duplication formula **18.4.8** gives $\sigma(.8+.4i)=.81465\,765+.38819\,473i$.

Given $\sigma(\wp, \wp', \zeta)$ corresponding to a point in the Fundamental Rectangle, as well as $g_2$ and $g_3$ or the equivalent, find $z$.

Only a few significant figures are obtainable from the use of any of the given (truncated) reversed series, except in a small neighborhood of the center of the series. For greater accuracy, use inverse interpolation procedures.

If the given function does not correspond to a value of $z$ in the Fundamental Rectangle (see Conformal Maps) the problem can always be reduced to this case by the use of appropriate reduction formulas in **18.2.** This process is relatively simple for $\wp(z)$, more difficult for the other functions (e.g. if $\Delta>0$ and $\wp=a+ib$, where $b>0$, simply consider $\overline{\wp}=a-ib$ and find $z_1$ in $R_1$ **[Figure 18.1]**; then compute $z_2=\bar{z}_1+2\omega'$, the point in $R_2$ corresponding to the given $\wp$).

$\Delta>0$

**Example 14.** Given $\wp=1-i$, $g_2=10$, $g_3=2$, find $z$. Using the first three terms of the reversed series **18.5.25** $z_1\approx.727+.423i$. The Laurent series **18.5.1** gives

$$\wp(z_1)=\wp(.727+.423i)=.825-.895i$$

and

$$\wp(z_2)=\wp(.697+.393i)=.938-1.038i.$$

Inverse interpolation gives $z_1^{(1)}=.707+.380i$. Repeated applications of the above procedure yield $z=.706231+.379893i$.

$\Delta<0$

**Example 14.** Given $\wp=1+i$, $g_2=-10$, $g_3=2$, find $z$. From **Example 6,** $\omega_2=1.40239\,48$ and $\omega_2'=1.52561\,02i$. Since $b>0$, $z$ exists in $R_2$ and $z$ is computed with $\overline{\wp}$. Using **18.5.25** with $\alpha_2=-1.25$, $\alpha_3=.25$, $u=[(\overline{\wp})^{-1}]^{1/2}$ and the coefficients $c_n$ from **Example 8**

$$2u=1.55377\,3973+.64359\,42493i$$

$$c_2u^5=.08044\,9281-.19422\,17466i$$

$$c_3u^7=-.01961\,9359+.00812\,66047i$$

$$\frac{\alpha_2^2u^9}{3}=-.10115\,7160-.04190\,06673i$$

$\Delta>0$

**Example 15.** Given $\zeta=10-15i$, $g_2=8$, $g_3=4$, find $z$. Using the reversed series **18.5.40** with

$$A_5=-.13333\ 333,$$

$$A_7=-.02857\ 14286,$$

$$u=\ .03076\ 923076+.04615\ 384615i$$

$$A_5u^5=-.00000\ 001402+.00000\ 006860i$$

$$A_7u^7=-.00000\ 000004-.00000\ 000003i$$

$$z=\ .03076\ 921670+.04615\ 391472i.$$

$\Delta<0$

Stopping with the term in $u^7$, $z_1\approx.81+.23i$. Assuming $\Delta z=-.03-.01i$, using **18.5.1,** $\wp(.81+.23i)=.91410\ \ 95-.86824\ \ 37i$, $\wp(.78+.22i)=1.03191\ 60-.91795\ 22i$; with inverse interpolation $z_1^{(1)}=.\,7725+.2404i$. Repeated applications of inverse interpolation yield $z=.\,772247-.239258i$.

**Example 15.** Given $\sigma=.4+.1i$, $g_2=7$, $g_3=6$, find $z$. Using the reversed series **18.5.70** with $\gamma_2=.14583$, $\gamma_3=.05$

$$\sigma=+.40000\ 000+.10000\ 000i$$

$$\frac{\gamma_2\sigma^5}{5}=+.00011\ 783+.00032\ 696i$$

$$\frac{\gamma_3\sigma^7}{7}=-.00000\ 208+.00001\ 432i$$

$$\frac{3\gamma_2^2\sigma^9}{14}=-.00000\ 093+.00000\ 126i$$

$$\frac{19\gamma_2\gamma_3\sigma^{11}}{55}=-.00000\ 013+.00000\ 006i$$

$$z=.40011\ 469+.10034\ 260i$$

---

### Methods of Computation of $\wp$ ($\wp'$, $\zeta$ or $\sigma$) for Given $z$ and Given $g_2$, $g_3$ (or the equivalent), with the Use of Automatic Digital Computing Machinery

(a) Integration of Differential Equation

$\wp$ and $\wp'$ may be generated for any $z$ close enough to a "known point" $z^*$($\wp(z^*)$ and $\wp'(z^*)$ being given) by integrating $\wp''=6\wp^2-g_2/2$. A program to do this on SWAC, via a modification of the Hammer-Hollingsworth method (MTAC, July 1955, pp. 92–96) due to Dr. P. Henrici, exists at Numerical Analysis Research, UCLA (code number 00600, written by W. L. Wilson, Jr.). The program has been tested numerically in the equianharmonic case, using integration steps of various sizes. For example, if one starts with $z^*=\omega_2$, using an "integration step" $(h,k)$, where $h$ and $k$ are respectively the horizontal and vertical components of a step, with $(h,k)$ having one of the six values $(\pm2h_0,0)$, $(\pm h_0,\pm k_0)$, $h_0=\omega_2/2000$, $k_0=|\omega_2'|/2000$, one can expect almost 8S in $\wp$ and 7S in $\wp'$ after 1000 steps, unless $z$ is too near a pole.

(b) Use of Series

The process of reducing the computation problem to one in which $z$ is in the Fundamental Rectangle can obviously be mechanized. Inside the Fundamental Rectangle the direct use of Laurent's series is appropriate when the period ratio $a$ is not too large. However, if $a\geqq\sqrt{3}(\Delta>0)$ or $a\geqq2\sqrt{3}(\Delta<0)$, the series will diverge at the far corner of the Fundamental Rectangle, so that use may be made of an appropriate duplication formula. Alternatively, one may compute the functions on $0x$ and $0y$, then use an addition formula. Even so, the series will diverge at $z=ia$ if $a\geqq2(\Delta>0)$ and at $z=ia/2$ if $a\geqq4(\Delta<0)$.

For great accuracy, multiple precision operations might be necessary. Double precision floating point mode has been used in a program, written for SWAC, to compute $\wp$, $\wp'$ and $\zeta$.

For computation of $\sigma$, use of the Maclaurin series throughout the Fundamental Rectangle is probably simplest (series converges for all $z$).

Mention should be made of the possible use of the series defining the $\vartheta$ functions. These series converge for all complex $v$, and the computation of $\wp$, $\wp'$, $\zeta$ and $\sigma$ by **18.10.5–18.10.8** could easily be mechanized. The series involved have the advantage of converging very fast, even in case $\Delta<0$, where $|q|\leqq e^{-\pi/2}(q\leqq e^{-\pi}$ if $\Delta>0)$.

### *Use of Maps*

If the problem (of computing $\wp$, $\wp'$, $\zeta$ or $\sigma$ for given $z$) is reduced to the case where the real half-period is unity and imaginary half-period is one of those used in the maps in **18.8** inspection of the appropriate figure will give the value of $\wp(z)$ [$\zeta(z)$ or $\sigma(z)$] to 2−3S. If $\wp'$ is wanted instead, get $\wp$, use **18.6.3** to obtain $\wp'^2$ and select sign (s) of $\wp'$ appropriately. (See Conformal Mapping (**18.8**) for choice of sign of square root of $\wp'^2$).

*Computation of $z_0$*

Given $g_2$, $g_3$ (or equivalent)

Since $z_0^2\wp(z_0)=0$, the Laurent's series gives

$$0=1+c_2u^2+c_3u^3+c_4u^4+\ .\ .\ .$$

where $u=z_0^2$. We may solve this equation [by Graeffe's (root-squaring) process or otherwise] for its absolutely smallest root [having found an approximation to $|z_0|$ by Graeffe's process, we may use the fact that $z_0=\omega+iy_0(\Delta>0)$, $z_0=\omega_2+iy_0(\Delta<0)$ to obtain an approximation to $z_0$].

It is noted that $y_0/\omega$ is a monotonic decreasing function of (period ratio) $a\geqq 1$ for $\Delta>0$ and

$$[1\geqq y_0/\omega>\frac{2}{\pi}\text{ arccosh }\sqrt{3}(\approx.7297)].$$

$y_0/\omega_2$ is a monotonic increasing function of $a$ for $\Delta<0$ and

$$[0\leqq y_0/\omega_2<\frac{2}{\pi}\text{ arccosh }\sqrt{3}]$$

Further data is available from **Table 18.2** or from Conformal Maps defined by $\wp(z)$.

If the real half-period $\neq 1$, see **18.2** Homogeneity Relations. Interpolation with respect to $a$ will, in general, be difficult because of the non-uniform subintervals involved. Aitken's interpolation may be used in this case. As few as 3S may be obtained. For the computation of $\wp$, $\wp'$ or $\zeta$ at $z=x+iy$, an addition formula may be used (**18.4** and **Examples 11–12**).

### TABLE FOR OBTAINING $\wp$, $\wp'$ AND $\zeta$ ON $0x$ AND $0y$ **Table 18.2**

(Positive Discriminant—Unit Real Half-Period)

If the real half-period $\neq 1$, see **18.2** Homogeneity Relations. Interpolation with respect to $a$ will, in general, be difficult because of the non-uniform subintervals involved. Aitken's interpolation may be used in this case. As few as 3S may be obtained. For the computation of $\wp$, $\wp'$ or $\zeta$ at $z=x+iy$, an addition formula may be used (**18.4** and **Examples 11–12**).

**Table 18.2**

### TABLE FOR OBTAINING $\wp$, $\wp'$ AND $\zeta$ ON $0x$ AND $0y$

| ∞ | 8.11742 426 | 4.45087 590 | 1.64493 41 | −0.82246 70 | 0.82246 704 | ∞ |
| Δ=0 | $\left[{(-3)7 \atop 8}\right]$ | $\left[{(-3)9 \atop 8}\right]$ | $\left[{(-4)1 \atop 5}\right]$ | $\left[{(-4)5 \atop 6}\right]$ | $\left[{(-5)7 \atop 6}\right]$ | $\left[{(-5)5 \atop 5}\right]$ |

For $a=1$: $g_2=\omega^4$, $g_3=0$, $e_1=\omega^2/2$, $e_3=-\omega^2/2$, $\eta=\pi/4$, $\eta'/i=-\pi/4$.

For $a=\infty$: $g_2=\pi^4/12$, $g_3=\pi^6/216$, $e_1=\pi^2/6$, $e_3=-\pi^2/12$, $\eta=\pi^2/12$, $\eta'/i=\infty$.

($\omega=1.85407\ 4677$ is the real half-period in the Lemniscatic case **18.14**.)

For $4<a<\infty$, to obtain $\eta'$ use Legendre's relation $\eta'=\eta\omega'-\pi i/2$.

To obtain the corresponding values of tabulated quantities when the real half-period $\omega\neq 1$, multiply $g_2$ by $\omega^{-4}$, $g_3$ by $\omega^{-6}$, $e_i$ by $\omega^{-2}$ and $\eta$ by $\omega^{-1}$.

$\omega_2=1+\omega'$, $e_2=\wp(1+\omega')=-(e_1+e_3)$, $\eta_2=\zeta(1+\omega')=\eta+\eta'$.

For $a=1$: $\sigma(1)=e^{\pi/8}2^{1/4}/\omega$, $\sigma(\omega')=i\sigma(1)$, $\sigma(\omega_2)=\sqrt{2}e^{\pi/4}e^{i\pi/4}/\omega$.

For $a=\infty$: $\sigma(1)=2e^{\pi^2/24}/\pi$, $\sigma(\omega')=0$, $\sigma(\omega_2)=0$.

($\omega=1.85407\ 4677$ is the real half-period in the Lemniscatic case **18.14.**)

To obtain the corresponding values of tabulated quantities when the real half-period $\omega\neq1$, multiply $\sigma$ by $\omega$.

**Table 18.3** INVARIANTS AND VALUES AT HALF-PERIODS

(Non-Positive Discriminant—Unit Real Half-Period)

| $a=\omega_2'/i$ | $g_2$ | $g_3$ | $\mathscr{R}e_1=\mathscr{R}\wp\left(\frac{1}{2}-\frac{\omega_2'}{2}\right)$ | $\mathscr{I}e_1=\mathscr{I}\wp\left(\frac{1}{2}-\frac{\omega_2'}{2}\right)$ | $\eta_2=\zeta(1)$ | $\eta_2'/i=\zeta(\omega_2')/i$ |

| $\Delta=0$ | $\left[{(-2)3 \atop 9}\right]$ | $\left[{(-2)8 \atop 8}\right]$ | $\left[{(-4)4 \atop 7}\right]$ | $\left[{(-3)1 \atop 6}\right]$ | $\left[{(-4)3 \atop 6}\right]$ | $\left[{(-4)3 \atop 6}\right]$ |

For a = 1: $g_2=-4\omega^4$, $g_3=0$, $\mathscr{R}e_1=0$, $\mathscr{I}e_1=\omega^2$, $\eta_2=\pi/2$, $\eta_2'/i=-\pi/2$.

For a = ∞: $g_2=\pi^4/12$, $g_3=\pi^6/216$, $\mathscr{R}e_1=-\pi^2/12$, $\mathscr{I}e_1=0$, $\eta_2=\pi^2/12$, $\eta_2'/i=\infty$.

($\omega=1.85407\ 4677$ is the real half-period in the Lemniscatic case **18.14**.)

For $4<a<\infty$, to obtain $\eta_2'$ use Legendre's relation $\eta_2'=\eta_2\omega_2'-\pi i$.

To obtain the corresponding values of tabulated quantities when the real half-period $\omega_2\neq 1$, multiply $g_2$ by $\omega_2^{-4}$, $g_3$ by $\omega_2^{-6}$, $e_i$ by $\omega_2^{-2}$ and $\eta$ by $\omega_2^{-1}$.

## INVARIANTS AND VALUES AT HALF-PERIODS Table 18.3

(Non-Positive Discriminant—Unit Real Half-Period)

| $a=\omega_2'/i$ | $\sigma(1)$ | $\sigma(\omega_2')/i$ | $\mathcal{R}\sigma(\omega')$ | $\mathcal{I}\sigma(\omega')$ |
|---|---|---|---|---|

# 19. Parabolic Cylinder Functions

## Mathematical Properties

### 19.1. The Parabolic Cylinder Functions

#### Introductory

These are solutions of the differential equation

**19.1.1** $$\frac{d^2y}{dx^2}+(ax^2+bx+c)y=0$$

with two real and distinct standard forms

**19.1.2** $$\frac{d^2y}{dx^2}-(\tfrac{1}{4}x^2+a)y=0$$

**19.1.3** $$\frac{d^2y}{dx^2}+(\tfrac{1}{4}x^2-a)y=0$$

The functions

**19.1.4**

$$y(a,\,x)\qquad y(a,\,-x)\qquad y(-a,\,ix)\qquad y(-a,\,-ix)$$

are all solutions either of **19.1.2** or of **19.1.3** if any one is such a solution.

Replacement of $a$ by $-ia$ and $x$ by $xe^{\frac{1}{4}i\pi}$ converts **19.1.2** into **19.1.3.** If $y(a,\,x)$ is a solution of **19.1.2,** then **19.1.3** has solutions:

**19.1.5**

$$y(-ia,\,xe^{\frac{1}{4}i\pi})\qquad y(-ia,\,-xe^{\frac{1}{4}i\pi})$$
$$y(ia,\,-xe^{-\frac{1}{4}i\pi})\qquad y(ia,\,xe^{-\frac{1}{4}i\pi})$$

Both variable $x$ and the parameter $a$ may take on general complex values in this section and in many subsequent sections. Practical applications appear to be confined to real solutions of real equations; therefore attention is confined to such solutions, and, in general, formulas are given for the two equations **19.1.2** and **19.1.3** independently. The principal computational consequence of the remarks above is that reflection in the $y$-axis produces an independent solution in almost all cases (Hermite functions provide an exception), so that tables may be confined either to positive $x$ or to a single solution of **19.1.2** or **19.1.3.**

## The Equation $\frac{d^2y}{dx^2}-\left(\frac{1}{4}\,x^2+a\right)y=0$

### 19.2. Power Series in $x$

Even and odd solutions of **19.1.2** are given by

**19.2.1**

$$y_1=e^{-\frac{1}{4}x^2}M(\tfrac{1}{2}a+\tfrac{1}{4},\,\tfrac{1}{2},\,\tfrac{1}{2}x^2)$$
$$=e^{-\frac{1}{4}x^2}\left\{1+(a+\tfrac{1}{2})\,\frac{x^2}{2!}+(a+\tfrac{1}{2})\,(a+\tfrac{5}{2})\,\frac{x^4}{4!}+\ldots\right\}$$
$$=e^{-\frac{1}{4}x^2}{}_1F_1(\tfrac{1}{2}a+\tfrac{1}{4};\,\tfrac{1}{2};\,\tfrac{1}{2}x^2)$$

**19.2.2**

$$=e^{\frac{1}{4}x^2}M(-\tfrac{1}{2}a+\tfrac{1}{4},\,\tfrac{1}{2},\,-\tfrac{1}{2}x^2)$$
$$=e^{\frac{1}{4}x^2}\left\{1+(a-\tfrac{1}{2})\,\frac{x^2}{2!}+(a-\tfrac{1}{2})(a-\tfrac{5}{2})\,\frac{x^4}{4!}+\ldots\right\}$$

**19.2.3**

$$y_2=xe^{-\frac{1}{4}x^2}M(\tfrac{1}{2}a+\tfrac{3}{4},\,\tfrac{3}{2},\,\tfrac{1}{2}x^2)$$
$$=e^{-\frac{1}{4}x^2}\left\{x+(a+\tfrac{3}{2})\,\frac{x^3}{3!}+(a+\tfrac{3}{2})(a+\tfrac{7}{2})\,\frac{x^5}{5!}+\ldots\right\}$$

**19.2.4**

$$=xe^{\frac{1}{4}x^2}M(-\tfrac{1}{2}a+\tfrac{3}{4},\,\tfrac{3}{2},\,-\tfrac{1}{2}x^2)$$
$$=e^{\frac{1}{4}x^2}\left\{x+(a-\tfrac{3}{2})\,\frac{x^3}{3!}+(a-\tfrac{3}{2})(a-\tfrac{7}{2})\,\frac{x^5}{5!}+\ldots\right\}$$

these series being convergent for all values of $x$ (see chapter **13** for $M(a,\,c,\,z)$).

Alternatively,

**19.2.5**

$$y_1=1+a\,\frac{x^2}{2!}+\left(a^2+\frac{1}{2}\right)\frac{x^4}{4!}+\left(a^3+\frac{7}{2}\,a\right)\frac{x^6}{6!}$$
$$+\left(a^4+11a^2+\frac{15}{4}\right)\frac{x^8}{8!}+\left(a^5+25a^3+\frac{211}{4}\,a\right)\frac{x^{10}}{10!}+\ldots$$

**19.2.6**

$$y_2=x+a\,\frac{x^3}{3!}+\left(a^2+\frac{3}{2}\right)\frac{x^5}{5!}+\left(a^3+\frac{13}{2}\,a\right)\frac{x^7}{7!}$$
$$+\left(a^4+17a^2+\frac{63}{4}\right)\frac{x^9}{9!}+\left(a^5+35a^3+\frac{531}{4}\,a\right)\frac{x^{11}}{11!}+\ldots$$

in which non-zero coefficients $a_n$ of $x^n/n!$ are connected by

**19.2.7** $$a_{n+2}=a\cdot a_n+\frac{1}{4}\,n(n-1)\,a_{n-2}$$

## 19.3. Standard Solutions

These have been chosen to have the asymptotic behavior exhibited in **19.8.** The first is Whittaker's function [19.8, 19.9] in a more symmetrical notation.

**19.3.1**

$$U(a,x)=D_{-a-\frac{1}{2}}(x)=\cos\pi(\tfrac{1}{4}+\tfrac{1}{2}a)\cdot Y_1 \\ -\sin\pi(\tfrac{1}{4}+\tfrac{1}{2}a)\cdot Y_2$$

**19.3.2**

$$V(a,x)=\frac{1}{\Gamma(\frac{1}{2}-a)}\{\sin\pi(\tfrac{1}{4}+\tfrac{1}{2}a)\cdot Y_1 \\ +\cos\pi(\tfrac{1}{4}+\tfrac{1}{2}a)\cdot Y_2\}$$

in which

**19.3.3** $$Y_1=\frac{1}{\sqrt{\pi}}\frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}}y_1=\sqrt{\pi}\frac{\sec\pi(\frac{1}{4}+\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}\Gamma(\frac{3}{4}+\frac{1}{2}a)}y_1$$

**19.3.4** $$Y_2=\frac{1}{\sqrt{\pi}}\frac{\Gamma(\frac{3}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a-\frac{1}{4}}}y_2=\sqrt{\pi}\frac{\csc\pi(\frac{1}{4}+\frac{1}{2}a)}{2^{\frac{1}{2}a-\frac{1}{4}}\Gamma(\frac{1}{4}+\frac{1}{2}a)}y_2$$

**19.3.5**

$$U(a,0)=\frac{\sqrt{\pi}}{2^{\frac{1}{2}a+\frac{1}{4}}\Gamma(\frac{3}{4}+\frac{1}{2}a)}$$

$$U'(a,0)=-\frac{\sqrt{\pi}}{2^{\frac{1}{2}a-\frac{1}{4}}\Gamma(\frac{1}{4}+\frac{1}{2}a)}$$

**19.3.6**

$$V(a,0)=\frac{2^{\frac{1}{2}a+\frac{1}{4}}\sin\pi(\frac{3}{4}-\frac{1}{2}a)}{\Gamma(\frac{3}{4}-\frac{1}{2}a)}$$

$$V'(a,0)=\frac{2^{\frac{1}{2}a+\frac{3}{4}}\sin\pi(\frac{1}{4}-\frac{1}{2}a)}{\Gamma(\frac{1}{4}-\frac{1}{2}a)}$$

In terms of the more familiar $D_n(x)$ of Whittaker,

**19.3.7** $$U(a,x)=D_{-a-\frac{1}{2}}(x)$$

**19.3.8**

$$V(a,x)=\frac{1}{\pi}\Gamma(\tfrac{1}{2}+a)\{\sin\pi a\cdot D_{-a-\frac{1}{2}}(x)+D_{-a-\frac{1}{2}}(-x)\}$$

## 19.4. Wronskian and Other Relations

**19.4.1** $$W\{U,V\}=\sqrt{2/\pi}$$

**19.4.2**

$$\pi V(a,x)=\Gamma(\tfrac{1}{2}+a)\{\sin\pi a\cdot U(a,x)+U(a,-x)\}$$

**19.4.3**

$$\Gamma(\tfrac{1}{2}+a)U(a,x)=\pi\sec^2\pi a\{V(a,-x) \\ -\sin\pi a\cdot V(a,x)\}$$

**19.4.4**

$$\frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)\cos\pi(\frac{1}{4}+\frac{1}{2}a)}{\sqrt{\pi}2^{\frac{1}{2}a-\frac{1}{4}}}y_1=2\sin\pi(\tfrac{3}{4}+\tfrac{1}{2}a)\cdot Y_1 \\ =U(a,x)+U(a,-x)$$

**19.4.5**

$$-\frac{\Gamma(\frac{3}{4}-\frac{1}{2}a)\sin\pi(\frac{1}{4}+\frac{1}{2}a)}{\sqrt{\pi}2^{\frac{1}{2}a-\frac{3}{4}}}y_2=2\cos\pi(\tfrac{3}{4}+\tfrac{1}{2}a)\cdot Y_2 \\ =U(a,x)-U(a,-x)$$

**19.4.6**

$$\sqrt{2\pi}U(-a,\pm ix)= \\ \Gamma(\tfrac{1}{2}+a)\{e^{-i\pi(\frac{1}{2}a-\frac{1}{4})}U(a,\pm x)+e^{i\pi(\frac{1}{2}a-\frac{1}{4})}U(a,\mp x)\}$$

**19.4.7**

$$\sqrt{2\pi}U(a,\pm x)= \\ \Gamma(\tfrac{1}{2}-a)\{e^{-i\pi(\frac{1}{2}a+\frac{1}{4})}U(-a,\pm ix)+e^{i\pi(\frac{1}{2}a+\frac{1}{4})}U(-a,\mp ix)\}$$

## 19.5. Integral Representations

A full treatment is given in [19.11] section 4. Representations are given here for $U(a,z)$ only; others may be derived by use of the relations given in **19.4.**

**19.5.1** $$U(a,z)=\frac{\Gamma(\frac{1}{2}-a)}{2\pi i}e^{-\frac{1}{4}z^2}\int_\alpha e^{zs-\frac{1}{2}s^2}s^{a-\frac{1}{2}}ds$$

**19.5.2** $$=\frac{\Gamma(\frac{1}{2}-a)}{2\pi i}e^{\frac{1}{4}z^2}\int_\beta e^{-\frac{1}{2}t^2}(z+t)^{a-\frac{1}{2}}dt$$

where $\alpha$ and $\beta$ are the contours shown in **Figures 19.1** and **19.2.**

When $a+\frac{1}{2}$ is a positive integer these integrals become indeterminate; in this case

**19.5.3** $$U(a,z)=\frac{1}{\Gamma(\frac{1}{2}+a)}e^{-\frac{1}{4}z^2}\int_0^\infty e^{-zs-\frac{1}{2}s^2}s^{a-\frac{1}{2}}ds$$

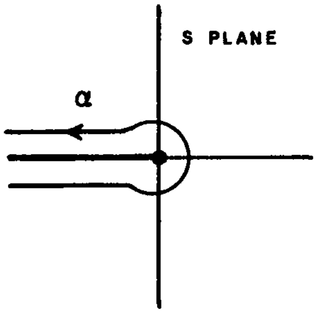

FIGURE 19.1

$-\pi<\arg s<\pi$

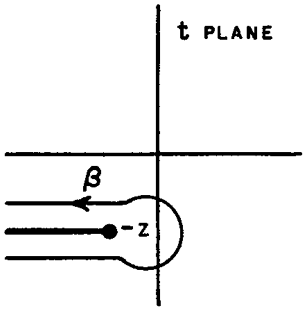

FIGURE 19.2

$-\pi<\arg (z+t)>\pi$

**19.5.4** $$U(a,z)=\frac{1}{\sqrt{2\pi i}}\,e^{\frac{1}{4}z^2}\int_{\epsilon} e^{-zs+\frac{1}{2}s^2}s^{-a-\frac{1}{2}}ds$$

**19.5.5** $$=\frac{e^{(a-\frac{1}{2})\pi i}}{\sqrt{2\pi i}}\,e^{\frac{1}{4}z^2}\int_{\epsilon_3} e^{zs+\frac{1}{2}s^2}s^{-a-\frac{1}{2}}ds$$

**19.5.6** $$=\frac{e^{-(a-\frac{1}{2})\pi i}}{\sqrt{2\pi i}}\,e^{\frac{1}{4}z^2}\int_{\epsilon_4} e^{zs+\frac{1}{2}s^2}s^{-a-\frac{1}{2}}ds$$

where $\epsilon$, $\epsilon_3$ and $\epsilon_4$ are shown in **Figures 19.3** and **19.4.**

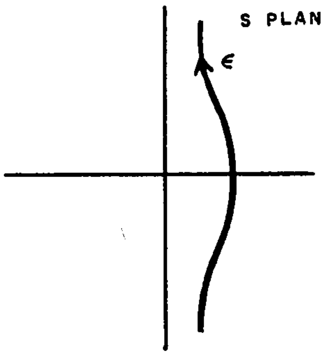

FIGURE 19.3
$-\frac{1}{2}\pi<\arg s<\frac{1}{2}\pi$

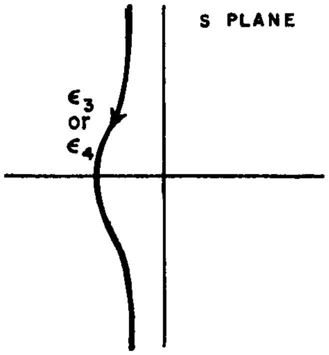

FIGURE 19.4
On $\epsilon_3$ $\frac{1}{2}\pi<\arg s<\frac{3}{2}\pi$
On $\epsilon_4$ $-\frac{3}{2}\pi<\arg s<-\frac{1}{2}\pi$

**19.5.7**
$$U(a,z)=\frac{\Gamma(\frac{3}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{3}{4}}\pi i}\int_{(\zeta_1)} e^{\frac{1}{4}z^2t}(1+t)^{\frac{1}{2}a-\frac{3}{4}}(1-t)^{-\frac{1}{2}a-\frac{3}{4}}dt$$

**19.5.8**
$$=\frac{\Gamma(\frac{3}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{3}{4}}\pi i}\int_{\zeta_1} \tfrac{1}{2}ze^{v}(\tfrac{1}{4}z^2+v)^{\frac{1}{2}a-\frac{3}{4}}(\tfrac{1}{4}z^2-v)^{-\frac{1}{2}a-\frac{3}{4}}dv$$

**19.5.9**
$$U(a,z)$$
$$=\frac{i\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}\pi}\int_{(\eta_1)} \tfrac{1}{2}ze^{-\frac{1}{4}z^2t}(1+t)^{-\frac{1}{2}a-\frac{1}{4}}(1-t)^{\frac{1}{2}a-\frac{1}{4}}dt$$

**19.5.10**
$$=\frac{i\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}\pi}\int_{\eta_1} e^{-v}(\tfrac{1}{4}z^2+v)^{-\frac{1}{2}a-\frac{1}{4}}(\tfrac{1}{4}z^2-v)^{\frac{1}{2}a-\frac{1}{4}}dv$$

The contour $\zeta_1$ is such that $(\frac{1}{4}z^2+v)$ goes from $\infty e^{-i\pi}$ to $\infty e^{i\pi}$ while $v=\frac{1}{4}z^2$ is *not* encircled; $(\frac{1}{4}z^2-v)^{-\frac{1}{2}a-\frac{3}{4}}$ has its principal value except possibly in the immediate neighborhood of the branch-point when encirclement is being avoided. Likewise $\eta_1$ is such that $(\frac{1}{4}z^2-v)$ goes from $\infty e^{i\pi}$ to $\infty e^{-i\pi}$ while encirclement of $v=-\frac{1}{4}z^2$ is similarly avoided. The contours $(\zeta_1)$ and $(\eta_1)$ may be obtained from $\zeta_1$ and $\eta_1$ by use of the substitution $v=\frac{1}{4}z^2t$.

The expressions **19.5.7** and **19.5.8** become indeterminate when $a=\frac{3}{2}, \frac{7}{2}, \frac{11}{2}, \ldots$; for these values

**19.5.11**
$$U(a,z)=\frac{1}{\Gamma(\frac{1}{4}+\frac{1}{2}a)}\,ze^{-\frac{1}{4}z^2}\int_0^\infty e^{-s}s^{\frac{1}{2}a-\frac{3}{4}}(z^2+2s)^{-\frac{1}{2}a-\frac{3}{4}}ds$$

Again **19.5.9** and **19.5.10** become indeterminate when $a=\frac{1}{2}, \frac{5}{2}, \frac{9}{2}, \ldots$; for these values

**19.5.12**
$$U(a,z)=\frac{1}{\Gamma(\frac{3}{4}+\frac{1}{2}a)}\,e^{-\frac{1}{4}z^2}\int_0^\infty e^{-s}s^{\frac{1}{2}a-\frac{1}{4}}(z^2+2s)^{-\frac{1}{2}a-\frac{1}{4}}ds$$

### Barnes-Type Integrals

**19.5.13** $$U(a,z)=\frac{e^{-\frac{1}{4}z^2}}{2\pi i}\,z^{-a-\frac{1}{2}}\int_{-\infty i}^{+\infty i}\frac{\Gamma(s)\Gamma(\frac{1}{2}+a-2s)}{\Gamma(\frac{1}{2}+a)}\,(\sqrt{2}z)^{2s}ds \qquad (|\arg z|<\tfrac{3}{4}\pi)$$

where the contour separates the zeros of $\Gamma(s)$ from those of $\Gamma(a+\frac{1}{2}-2s)$. Similarly

**19.5.14** $$V(a,z)=\sqrt{\frac{2}{\pi}}\,\frac{e^{\frac{1}{4}z^2}}{2\pi i}\,z^{a-\frac{1}{2}}\int_{-\infty i}^{+\infty i}\frac{\Gamma(s)\Gamma(\frac{1}{2}-a-2s)}{\Gamma(\frac{1}{2}-a)}\,(\sqrt{2}z)^{2s}\cos s\pi\, ds \qquad (|\arg z|<\tfrac{1}{4}\pi)$$

## 19.6. Recurrence Relations

**19.6.1** $U'(a,x)+\frac{1}{2}xU(a,x)+(a+\frac{1}{2})U(a+1,x)=0$

**19.6.2** $U'(a,x)-\frac{1}{2}xU(a,x)+U(a-1,x)=0$

**19.6.3** $2U'(a,x)+U(a-1,x)+(a+\frac{1}{2})U(a+1,x)=0$

**19.6.4** $xU(a,x)-U(a-1,x)+(a+\frac{1}{2})U(a+1,x)=0$

These are also satisfied by $\Gamma(\frac{1}{2}-a)V(a,x)$.

**19.6.5** $V'(a,x)-\frac{1}{2}xV(a,x)-(a-\frac{1}{2})V(a-1,x)=0$

**19.6.6** $V'(a,x)+\frac{1}{2}xV(a,x)-V(a+1,x)=0$

**19.6.7**
$$2V'(a,x)-V(a+1,x)-(a-\tfrac{1}{2})V(a-1,x)=0$$

**19.6.8**
$$xV(a,x)-V(a+1,x)+(a-\tfrac{1}{2})V(a-1,x)=0$$

These are also satisfied by $U(a,x)/\Gamma(\frac{1}{2}-a)$

**19.6.9** $y_1'(a,x)+\frac{1}{2}xy_1(a,x)=(a+\frac{1}{2})y_2(a+1,x)$

**19.6.10** $y_1'(a,x)-\frac{1}{2}xy_1(a,x)=(a-\frac{1}{2})y_2(a-1,x)$

**19.6.11** $y_2'(a,x)+\frac{1}{2}xy_2(a,x)=y_1(a+1,x)$

**19.6.12** $y_2'(a,x)-\frac{1}{2}xy_2(a,x)=y_1(a-1,x)$

## Asymptotic Expansions

### 19.7. Expressions in Terms of Airy Functions

When $a$ is large and negative, write, for $0\leq x<\infty$

$$x=2\sqrt{|a|}\xi \qquad t=(4|a|)^{\frac{1}{3}}\tau$$

**19.7.1**

$$\tau=-(\tfrac{3}{2}\vartheta_3)^{\frac{2}{3}}$$

$$\vartheta_3=\tfrac{1}{2}\int_\xi^1\sqrt{1-s^2}ds=\tfrac{1}{4}\arccos\xi-\tfrac{1}{4}\xi\sqrt{1-\xi^2}\quad(\xi\leq 1)$$

**19.7.2**

$$\tau=+(\tfrac{3}{2}\vartheta_2)^{\frac{2}{3}}$$

$$\vartheta_2=\tfrac{1}{2}\int_1^\xi\sqrt{s^2-1}ds=\tfrac{1}{4}\xi\sqrt{\xi^2-1}-\tfrac{1}{4}\operatorname{arccosh}\xi\quad(\xi\geq 1)$$

Then for $x\geq 0$, $a\rightarrow-\infty$

**19.7.3**

$$U(a,x)\sim 2^{-\frac{1}{4}-\frac{1}{2}a}\Gamma(\tfrac{1}{4}-\tfrac{1}{2}a)\left(\frac{t}{\xi^2-1}\right)^{\frac{1}{4}}\mathrm{Ai}(t)$$

**19.7.4**

$$\Gamma(\tfrac{1}{2}-a)V(a,x)\sim 2^{-\frac{1}{4}-\frac{1}{2}a}\Gamma(\tfrac{1}{4}-\tfrac{1}{2}a)\left(\frac{t}{\xi^2-1}\right)^{\frac{1}{4}}\mathrm{Bi}(t)$$

**Table 19.3** gives $\tau$ as a function of $\xi$.

See [19.5] for further developments.

### 19.8. Expansions for $x$ Large and $a$ Moderate

When $x>>|a|$

**19.8.1**

$$U(a,x)\sim e^{-\frac{1}{4}x^2}x^{-a-\frac{1}{2}}\left\{1-\frac{(a+\frac{1}{2})(a+\frac{3}{2})}{2x^2}+\frac{(a+\frac{1}{2})(a+\frac{3}{2})(a+\frac{5}{2})(a+\frac{7}{2})}{2\cdot 4x^4}-\ldots\right\}$$

$$(x\rightarrow+\infty)$$

**19.8.2**

$$V(a,x)\sim\sqrt{\frac{2}{\pi}}e^{\frac{1}{4}x^2}x^{a-\frac{1}{2}}\left\{1+\frac{(a-\frac{1}{2})(a-\frac{3}{2})}{2x^2}+\frac{(a-\frac{1}{2})(a-\frac{3}{2})(a-\frac{5}{2})(a-\frac{7}{2})}{2\cdot 4x^4}+\ldots\right\}$$

$$(x\rightarrow+\infty)$$

These expansions form the basis for the choice of standard solutions in **19.3.** The former is valid for complex $x$, with $|\arg x|<\frac{3}{4}\pi$, in the complete sense of Watson [19.6], although valid for a wider range of $|\arg x|$ in Poincaré's sense; the second series is completely valid *only for $x$ real and positive.*

### 19.9. Expansions for $a$ Large With $x$ Moderate

(i) $a$ positive

When $a>>x^2$, with $p=\sqrt{a}$, then

**19.9.1** $$U(a,x)=\frac{\sqrt{\pi}}{2^{\frac{1}{2}a+\frac{1}{4}}\Gamma(\frac{3}{4}+\frac{1}{2}a)}\exp(-px+v_1)$$

**19.9.2** $$U(a,-x)=\frac{\sqrt{\pi}}{2^{\frac{1}{2}a+\frac{1}{4}}\Gamma(\frac{3}{4}+\frac{1}{2}a)}\exp(px+v_2)$$

where

**19.9.3** $$v_1,\ v_2\sim\mp\frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p}-\frac{(\frac{1}{2}x)^2}{(2p)^2}\mp\frac{\frac{1}{2}x-\frac{2}{5}(\frac{1}{2}x)^5}{(2p)^3}+\frac{2(\frac{1}{2}x)^4}{(2p)^4}\pm\frac{(\frac{16}{3}\frac{1}{2}x)^3-\frac{4}{7}(\frac{1}{2}x)^7}{(2p)^5}+\ldots$$

$$(a\rightarrow+\infty)$$

The upper sign gives the first function, and the lower sign the second function.

(ii) $a$ negative

When $-a>>x^2$, with $p=\sqrt{-a}$, then

**19.9.4**

$$U(a,x)+i\Gamma(\tfrac{1}{2}-a)\cdot V(a,x)=\frac{e^{i\pi(\frac{1}{4}+\frac{1}{2}a)}\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}\sqrt{\pi}}e^{ipx}\exp(v_r+iv_i)$$

where

**19.9.5**

$$v_r\sim+\frac{(\frac{1}{2}x)^2}{(2p)^2}+\frac{2(\frac{1}{2}x)^4}{(2p)^4}-\frac{9(\frac{1}{2}x)^2-\frac{16}{3}(\frac{1}{2}x)^6}{(2p)^6}-\ldots$$

$$v_i\sim-\frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p}+\frac{\frac{1}{2}x+\frac{2}{5}(\frac{1}{2}x)^5}{(2p)^3}+\frac{\frac{16}{3}(\frac{1}{2}x)^3-\frac{4}{7}(\frac{1}{2}x)^7}{(2p)^5}-\ldots$$

$$(a\rightarrow-\infty)$$

Further expansions of a similar type will be found in [19.11].

### 19.10. Darwin's Expansions

(i) $a$ positive, $x^2+4a$ large. Write

**19.10.1** $$X=\sqrt{x^2+4a}$$

$$\theta=4a\vartheta_1(x/2\sqrt{a})=\tfrac{1}{2}\int_0^x Xdx=\tfrac{1}{4}xX+a\ln\frac{x+X}{2\sqrt{a}}$$

$$=\frac{x}{4}\sqrt{x^2+4a}+a\operatorname{arcsinh}\frac{x}{2\sqrt{a}}$$

(see **Table 19.3** for $\vartheta_1$), then

**19.10.2** $$U(a, x)=\frac{(2\pi)^{1/4}}{\sqrt{\Gamma(\frac{1}{2}+a)}} \exp\{-\theta+v(a, x)\}$$

**19.10.3** $$U(a, -x)=\frac{(2\pi)^{1/4}}{\sqrt{\Gamma(\frac{1}{2}+a)}} \exp\{\theta+v(a, -x)\}$$

where

**19.10.4**

$$v(a, x)\sim-\tfrac{1}{2}\ln X+\sum_{s=1} (-1)^s d_{3s}/X^{3s}$$

$$(a>0,\ x^2+4a\rightarrow+\infty)$$

and $d_{3s}$ is given by **19.10.13.**

(ii) $a$ negative, $x^2+4a$ large and positive. Write

**19.10.5** $$X=\sqrt{x^2-4|a|}$$

$$\theta=4|a|\vartheta_2(x/2\sqrt{|a|})=\tfrac{1}{2}\int_{2\sqrt{|a|}}^{x} X dx=\tfrac{1}{4}xX+a\ln\frac{x+X}{2\sqrt{|a|}}$$

$$=\tfrac{1}{4}x\sqrt{x^2-4|a|}+a \operatorname{arccosh}\frac{x}{2\sqrt{|a|}}$$

(see **Table 19.3** for $\vartheta_2$), then

**19.10.6** $$U(a, x)=\frac{\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/4}} \exp\{-\theta+v(a, x)\}$$

**19.10.7**

$$V(a, x)=\frac{2}{(2\pi)^{1/4}\sqrt{\Gamma(\frac{1}{2}-a)}} \exp\{\theta+v(a, -x)\}$$

where again

**19.10.8**

$$v(a, x)\sim-\tfrac{1}{2}\ln X+\sum_{s=1} (-1)^s d_{3s}/X^{3s}$$

$$(a<0,\ x^2+4a\rightarrow+\infty)$$

and $d_{3s}$ is given by **19.10.13.**

(iii) $a$ large and negative and $x$ moderate. Write

**19.10.9** $$Y=\sqrt{4|a|-x^2}$$

$$\theta=4|a|\vartheta_4(x/2\sqrt{|a|})$$

$$=\tfrac{1}{2}\int_0^x Y dx=\tfrac{1}{4}xY+|a| \arcsin\frac{x}{2\sqrt{|a|}}$$

(see **Table 19.3** for $\vartheta_4=\frac{1}{8}\pi-\vartheta_3$), then

**19.10.10**

$$U(a, x)=\frac{2\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{1/4}} e^{v_r}\cos\left\{\tfrac{1}{4}\pi+\tfrac{1}{2}\pi a+\theta+v_i\right\}$$

**19.10.11**

$$V(a, x)=$$

$$\frac{2}{(2\pi)^{\frac{1}{4}}\sqrt{\Gamma(\frac{1}{2}-a)}} e^{v_r}\sin\{\tfrac{1}{4}\pi+\tfrac{1}{2}\pi a+\theta+v_i\}$$

where

**19.10.12** $$v_r\sim-\tfrac{1}{2}\ln Y-\frac{d_6}{Y^6}+\frac{d_{12}}{Y^{12}}-\ldots$$

$$v_i\sim\frac{d_3}{Y^3}-\frac{d_9}{Y^9}+\ldots \qquad (x^2+4a\rightarrow-\infty)$$

In each case the coefficients $d_{3r}$ are given by

**19.10.13**

$$d_3=\frac{1}{a}\left(\frac{x^3}{48}+\tfrac{1}{4}ax\right)$$

$$d_6=\tfrac{3}{4}x^2-2a$$

$$d_9=\frac{1}{a^3}\left(-\frac{7}{5760}x^9-\frac{7}{320}ax^7-\frac{49}{320}a^2x^5\right.$$

$$\left.+\frac{31}{12}a^3x^3-19a^4x\right)$$

$$d_{12}=\frac{153}{8}x^4-186ax^2+80a^2$$

See [19.11] for $d_{15}, \ldots, d_{24}$, and [19.5] for an alternative form.

## 19.11. Modulus and Phase

When $a$ is negative and $|x|<2\sqrt{|a|}$, the functions $U$ and $V$ are oscillatory and it is sometimes convenient to write

**19.11.1** $$U(a, x)+i\Gamma(\tfrac{1}{2}-a)V(a, x)=F(a, x)e^{i\chi(a, x)}$$

**19.11.2** $$U'(a, x)+i\Gamma(\tfrac{1}{2}-a)V'(a, x)=-G(a, x)e^{i\psi(a, x)}$$

Then, when $a<0$ and $|a|>>x^2$,

**19.11.3**

$$F=\frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}\sqrt{\pi}} e^{v_r}, \qquad \chi=(\tfrac{1}{2}a+\tfrac{1}{4})\pi+px+v_i$$

where $v_r$, $v_i$ are given by **19.9.5** and $p=\sqrt{-a}$.

Alternatively, with $p=\sqrt{|a|}$, and again $-a>>x^2$,

**19.11.4**

$$F\sim\frac{\Gamma(\frac{1}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a+\frac{1}{4}}\sqrt{\pi}}\left\{1+\frac{x^2}{(4p)^2}+\frac{\frac{5}{2}x^4}{(4p)^4}\right.$$

$$\left.+\frac{\frac{15}{2}x^6-144x^2}{(4p)^6}+\ldots\right\}$$

**19.11.5**
$$\chi\sim(\tfrac{1}{2}a+\tfrac{1}{4})\pi+px\left\{1-\frac{\frac{2}{3}x^2}{(4p)^2}-\frac{\frac{2}{5}x^4-16}{(4p)^4}-\frac{\frac{4}{7}x^6-\frac{256}{3}x^2}{(4p)^6}-\ldots\right\}$$

**19.11.6**
$$G\sim\frac{\Gamma(\frac{3}{4}-\frac{1}{2}a)}{2^{\frac{1}{2}a-\frac{1}{4}}\sqrt{\pi}}\left\{1-\frac{x^2}{(4p)^2}-\frac{\frac{3}{2}x^4}{(4p)^4}-\frac{\frac{7}{2}x^6-176x^2}{(4p)^6}-\ldots\right\}$$

**19.11.7**
$$\psi\sim(\tfrac{1}{2}a-\tfrac{1}{4})\pi+px\left\{1-\frac{\frac{2}{3}x^2}{(4p)^2}-\frac{\frac{2}{5}x^4+16}{(4p)^4}-\frac{\frac{4}{7}x^6+\frac{320}{3}x^2}{(4p)^6}-\ldots\right\}$$

Again, when $x^2+4a$ is large and negative, with $Y=\sqrt{4|a|-x^2}$, then

**19.11.8**
$$F=\frac{2\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{\frac{1}{4}}}\,e^{v_r}\qquad \chi=\tfrac{1}{4}\pi+\tfrac{1}{2}\pi a+\theta+v_i$$

where $\theta$, $v_r$ and $v_i$ are given by **19.10.9** and **19.10.12.**

Another form is

**19.11.9**
$$F\sim\frac{2\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{\frac{1}{4}}\sqrt{Y}}\left(1+\frac{3}{4Y^4}+\frac{5a}{Y^6}+\frac{621}{32Y^8}+\ldots\right)\qquad (x^2+4a\to-\infty)$$

**19.11.10**
$$G\sim\frac{\sqrt{Y}\sqrt{\Gamma(\frac{1}{2}-a)}}{(2\pi)^{\frac{1}{4}}}\left(1-\frac{5}{4Y^4}-\frac{7a}{Y^6}-\frac{835}{32Y^8}-\ldots\right)\qquad (x^2+4a\to-\infty)$$

while $\psi$ and $\chi$ are connected by

**19.11.11**
$$\psi-\chi\sim-\tfrac{1}{2}\pi-\frac{x}{Y^3}\left(1+\frac{47}{6Y^4}+\frac{214a}{3Y^6}+\frac{14483}{40Y^8}+\ldots\right)\qquad (x^2+4a\to-\infty)$$

## Connections With Other Functions

### 19.12. Connection With Confluent Hypergeometric Functions (see chapter 13)

**19.12.1**
$$U(a,\pm x)=\frac{\sqrt{\pi}\,2^{-\frac{1}{2}a}x^{-\frac{1}{2}}}{\Gamma(\frac{3}{4}+\frac{1}{2}a)}\,M_{-\frac{1}{2}a,-\frac{1}{4}}(\tfrac{1}{2}x^2)\mp\frac{\sqrt{\pi}\,2^{1-\frac{1}{2}a}x^{-\frac{1}{2}}}{\Gamma(\frac{1}{4}+\frac{1}{2}a)}\,M_{-\frac{1}{2}a,\frac{1}{4}}(\tfrac{1}{2}x^2)$$

**19.12.2** $U(a,x)=2^{-\frac{1}{2}a}x^{-\frac{1}{2}}W_{-\frac{1}{2}a,-\frac{1}{4}}(\tfrac{1}{2}x^2)$

**19.12.3**
$$U(a,\pm x)=\frac{\sqrt{\pi}\,2^{-\frac{1}{4}-\frac{1}{2}a}e^{-\frac{1}{4}x^2}}{\Gamma(\frac{3}{4}+\frac{1}{2}a)}\,M(\tfrac{1}{2}a+\tfrac{1}{4},\tfrac{1}{2},\tfrac{1}{2}x^2)\mp\frac{\sqrt{\pi}\,2^{\frac{1}{4}-\frac{1}{2}a}xe^{-\frac{1}{4}x^2}}{\Gamma(\frac{1}{4}+\frac{1}{2}a)}\,M(\tfrac{1}{2}a+\tfrac{3}{4},\tfrac{3}{2},\tfrac{1}{2}x^2)$$

**19.12.4**
$$U(a,x)=2^{-\frac{1}{4}-\frac{1}{2}a}e^{-\frac{1}{4}x^2}U(\tfrac{1}{2}a+\tfrac{1}{4},\tfrac{1}{2},\tfrac{1}{2}x^2)=2^{-\frac{3}{4}-\frac{1}{2}a}xe^{-\frac{1}{4}x^2}U(\tfrac{1}{2}a+\tfrac{3}{4},\tfrac{3}{2},\tfrac{1}{2}x^2)$$

Expressions for $V(a,x)$ may be obtained from these by use of **19.4.2.**

### 19.13. Connection With Hermite Polynomials and Functions

When $n$ is a non-negative integer

**19.13.1**
$$U(-n-\tfrac{1}{2},x)=e^{-\frac{1}{4}x^2}He_n(x)=2^{-\frac{1}{2}n}e^{-\frac{1}{4}x^2}H_n(x/\sqrt{2})$$

**19.13.2**
$$V(n+\tfrac{1}{2},x)=\sqrt{2/\pi}\,e^{\frac{1}{4}x^2}He_n^*(x)=2^{-\frac{1}{2}n}e^{\frac{1}{4}x^2}H_n^*(x/\sqrt{2})$$

in which $H_n(x)$ and $He_n(x)$ are Hermite polynomials (see chapter 22) while

**19.13.3** $He_n^*(x)=e^{-\frac{1}{2}x^2}\dfrac{d^n}{dx^n}e^{\frac{1}{2}x^2}=(-i)^nHe_n(ix)$

**19.13.4** $H_n^*(x)=e^{-x^2}\dfrac{d^n}{dx^n}e^{x^2}=(-i)^nH_n(ix)$

This gives one elementary solution to **19.1.2** whenever $2a$ is an odd integer, positive or negative.

### 19.14. Connection With Probability Integrals and Dawson's Integral (see chapter 7)

If, as in [19.10]

**19.14.1** $Hh_{-1}(x)=e^{-\frac{1}{2}x^2}$

**19.14.2**
$$Hh_n(x)=\int_x^\infty Hh_{n-1}(t)dt=(1/n!)\int_x^\infty(t-x)^ne^{-\frac{1}{2}t^2}dt\qquad (n\geq 0)$$

then

**19.14.3** $U(n+\tfrac{1}{2},x)=e^{\frac{1}{4}x^2}Hh_n(x)\qquad (n\geq -1)$

Correspondingly

**19.14.4** $$V(\tfrac{1}{2},x)=\sqrt{2/\pi}e^{\frac{1}{4}x^2}$$

and

**19.14.5**

$$V(-n-\tfrac{1}{2},x)=e^{-\frac{1}{4}x^2}\left\{\int_0^x e^{-\frac{1}{4}t^2}V(-n+\tfrac{1}{2},t)dt-\frac{\sin\frac{1}{2}n\pi}{2^{\frac{1}{2}n}\Gamma(\frac{1}{2}n+1)}\right\}\quad(n\geq 0)$$

Here $V(-\tfrac{1}{2}, x)$ is closely related to Dawson's integral

$$\int_0^x e^{t^2}dt$$

These relations give a second solution of **19.1.2** whenever $2a$ is an odd integer, and a second solution is unobtainable from $U(a, x)$ by reflection in the $y$-axis.

## 19.15. Explicit Formula in Terms of Bessel Functions When $2a$ Is an Integer

Write

**19.15.1** $$I_{-n}-I_n=(2/\pi)\sin n\pi\cdot K_n$$

**19.15.2** $$I_{-n}+I_n=\cos n\pi\cdot\mathscr{J}_n$$

where the argument of all modified Bessel functions is $\frac{1}{4}x^2$. Then

**19.15.3** $$U(1,x)=2\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{3}{2}}(-K_{\frac{1}{4}}+K_{\frac{3}{4}})$$

**19.15.4** $$U(2,x)=2\cdot\tfrac{2}{3}\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{5}{2}}(2K_{\frac{1}{4}}-3K_{\frac{3}{4}}+K_{\frac{5}{4}})$$

**19.15.5**

$$U(3,x)=2\cdot\tfrac{2}{3}\cdot\tfrac{2}{5}\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{7}{2}}(-5K_{\frac{1}{4}}+9K_{\frac{3}{4}}-5K_{\frac{5}{4}}+K_{\frac{7}{4}})$$

**19.15.6** $$V(1,x)=\tfrac{1}{2}(\tfrac{1}{2}x)^{\frac{3}{2}}(\mathscr{J}_{\frac{1}{4}}-\mathscr{J}_{\frac{3}{4}})$$

**19.15.7** $$V(2,x)=\tfrac{1}{2}(\tfrac{1}{2}x)^{\frac{5}{2}}(2\mathscr{J}_{\frac{1}{4}}-3\mathscr{J}_{\frac{3}{4}}+\mathscr{J}_{\frac{5}{4}})$$

**19.15.8** $$V(3,x)=\tfrac{1}{2}(\tfrac{1}{2}x)^{\frac{7}{2}}(5\mathscr{J}_{\frac{1}{4}}-9\mathscr{J}_{\frac{3}{4}}+5\mathscr{J}_{\frac{5}{4}}-\mathscr{J}_{\frac{7}{4}})$$

**19.15.9** $$U(0,x)=\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{1}{2}}K_{\frac{1}{4}}$$

**19.15.10** $$U(-1,x)=\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{3}{2}}(K_{\frac{1}{4}}+K_{\frac{3}{4}})$$

**19.15.11**

$$U(-2,x)=\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{5}{2}}(2K_{\frac{1}{4}}+3K_{\frac{3}{4}}-K_{\frac{5}{4}})$$

**19.15.12**

$$U(-3,x)=\pi^{-\frac{1}{2}}(\tfrac{1}{2}x)^{\frac{7}{2}}(5K_{\frac{1}{4}}+9K_{\frac{3}{4}}-5K_{\frac{5}{4}}-K_{\frac{7}{4}})$$

**19.15.13** $$V(0,x)=\tfrac{1}{2}(\tfrac{1}{2}x)^{\frac{1}{2}}\mathscr{J}_{\frac{1}{4}}$$

**19.15.14** $$V(-1,x)=(\tfrac{1}{2}x)^{\frac{3}{2}}(\mathscr{J}_{\frac{1}{4}}+\mathscr{J}_{\frac{3}{4}})$$

**19.15.15** $$V(-2,x)=\tfrac{2}{3}(\tfrac{1}{2}x)^{\frac{5}{2}}(2\mathscr{J}_{\frac{1}{4}}+3\mathscr{J}_{\frac{3}{4}}-\mathscr{J}_{\frac{5}{4}})$$

**19.15.16**

$$V(-3,x)=\tfrac{2}{3}\cdot\tfrac{2}{5}(\tfrac{1}{2}x)^{\frac{7}{2}}(5\mathscr{J}_{\frac{1}{4}}+9\mathscr{J}_{\frac{3}{4}}-5\mathscr{J}_{\frac{5}{4}}-\mathscr{J}_{\frac{7}{4}})$$

**19.15.17** $$U(-\tfrac{1}{2},x)=\sqrt{2/\pi}(\tfrac{1}{2}x)K_{\frac{1}{2}}$$

**19.15.18** $$U(-\tfrac{3}{2},x)=\sqrt{2/\pi}(\tfrac{1}{2}x)^2 2K_{\frac{1}{2}}$$

**19.15.19** $$U(-\tfrac{5}{2},x)=\sqrt{2/\pi}(\tfrac{1}{2}x)^3(5K_{\frac{1}{2}}-K_{\frac{3}{2}})$$

**19.15.20** $$V(\tfrac{1}{2},x)=(\tfrac{1}{2}x)(I_{\frac{1}{2}}+I_{-\frac{1}{2}})$$

**19.15.21** $$V(\tfrac{3}{2},x)=(\tfrac{1}{2}x)^2(2I_{\frac{1}{2}}+2I_{-\frac{1}{2}})$$

**19.15.22** $$V(\tfrac{5}{2},x)=(\tfrac{1}{2}x)^3(5I_{\frac{1}{2}}+5I_{-\frac{1}{2}}-I_{\frac{3}{2}}-I_{-\frac{3}{2}})$$

# The Equation $\frac{d^2y}{dx^2}+\left(\frac{1}{4}x^2-a\right)y=0$

## 19.16. Power Series in $x$

Even and odd solutions are given by **19.2.1** to **19.2.4** with $-ia$ written for $a$ and $xe^{\frac{1}{4}i\pi}$ for $x$; the series involves complex quantities in which the imaginary part of the sum vanishes identically.

Alternatively,

**19.16.1**

$$y_1=1+a\frac{x^2}{2!}+(a^2-\tfrac{1}{2})\frac{x^4}{4!}+(a^3-\tfrac{7}{2}a)\frac{x^6}{6!}+(a^4-11a^2+\tfrac{15}{4})\frac{x^8}{8!}+(a^5-25a^3+\tfrac{211}{4}a)\frac{x^{10}}{10!}+\ldots$$

**19.16.2**

$$y_2=x+a\frac{x^3}{3!}+(a^2-\tfrac{3}{2})\frac{x^5}{5!}+(a^3-\tfrac{13}{2}a)\frac{x^7}{7!}+(a^4-17a^2+\tfrac{63}{4})\frac{x^9}{9!}+(a^5-35a^3+\tfrac{531}{4}a)\frac{x^{11}}{11!}+\ldots$$

in which non-zero coefficients $a_n$ of $x^n/n!$ are connected by

**19.16.3** $$a_{n+2}=a\cdot a_n-\tfrac{1}{4}n(n-1)a_{n-2}$$

## 19.17. Standard Solutions (see [19.4])

**19.17.1** $$W(a,\pm x)=\frac{(\cosh\pi a)^{\frac{1}{4}}}{2\sqrt{\pi}}(G_1y_1\mp\sqrt{2}G_3y_2)$$

**19.17.2** $$=2^{-3/4}\left(\sqrt{\frac{G_1}{G_3}}\,y_1\mp\sqrt{\frac{2G_3}{G_1}}\,y_2\right)$$

where

**19.17.3** $$G_1=|\Gamma(\tfrac{1}{4}+\tfrac{1}{2}ia)|\qquad G_3=|\Gamma(\tfrac{3}{4}+\tfrac{1}{2}ia)|$$

At $x=0$,

**19.17.4** $W(a,0)=\frac{1}{2^{\frac34}}\left|\frac{\Gamma(\frac14+\frac12 ia)}{\Gamma(\frac34+\frac12 ia)}\right|^{\frac12}=\frac{1}{2^{\frac34}}\sqrt{\frac{G_1}{G_3}}$

**19.17.5**

$$W'(a,0)=-\frac{1}{2^{\frac14}}\left|\frac{\Gamma(\frac34+\frac12 ia)}{\Gamma(\frac14+\frac12 ia)}\right|^{\frac12}=-\frac{1}{2^{\frac14}}\sqrt{\frac{G_3}{G_1}}$$

### Complex Solutions

**19.17.6** $E(a,x)=k^{-\frac12}W(a,x)+ik^{\frac12}W(a,-x)$

**19.17.7** $E^*(a,x)=k^{-\frac12}W(a,x)-ik^{\frac12}W(a,-x)$

where

**19.17.8** $k=\sqrt{1+e^{2\pi a}}-e^{\pi a}\qquad 1/k=\sqrt{1+e^{2\pi a}}+e^{\pi a}$

In terms of $U(a,x)$ of **19.3**,

**19.17.9** $E(a,x)=\sqrt{2}e^{\frac14\pi a+\frac18 i\pi+\frac12 i\phi_2}\,U(ia,xe^{-\frac14 i\pi})$

with

**19.17.10** $\phi_2=\arg\Gamma(\frac12+ia)$

where the branch is defined by $\phi_2=0$ when $a=0$ and by continuity elsewhere.

Also

**19.17.11**

$$\sqrt{2\pi}U(ia,xe^{-\frac14 i\pi})=\Gamma(\tfrac12-ia)\{e^{\frac14\pi a-\frac18 i\pi}U(-ia,xe^{\frac14 i\pi})+e^{-\frac14\pi a+\frac18 i\pi}U(-ia,-xe^{\frac14 i\pi})\}$$

### 19.18. Wronskian and Other Relations

**19.18.1** $W\{W(a,x),W(a,-x)\}=1$

**19.18.2** $W\{E(a,x),E^*(a,x)\}=-2i$

**19.18.3** $\sqrt{1+e^{2\pi a}}E(a,x)=e^{\pi a}E^*(a,x)+iE^*(a,-x)$

**19.18.4** $E^*(a,x)=e^{-i(\phi_2+\frac14\pi)}E(-a,ix)$

**19.18.5**

$$\sqrt{\Gamma(\tfrac12+ia)}E^*(a,x)=e^{-\frac14 i\pi}\sqrt{\Gamma(\tfrac12-ia)}E(-a,ix)$$

### 19.19. Integral Representations

These are covered for **19.1.3** as well as for **19.1.2** in **19.5** (general complex argument).

## Asymptotic Expansions

### 19.20. Expressions in Terms of Airy Functions

When $a$ is large and positive, write, for $0\leq x<\infty$

$$x=2\sqrt{a}\xi\qquad t=(4a)^{\frac23}\tau$$

**19.20.1**

$$\tau=-(\tfrac32\vartheta_3)^{\frac23}$$

$$\vartheta_3=\frac12\int_\xi^1\sqrt{1-s^2}\,ds=\tfrac14\arccos\xi-\tfrac14\xi\sqrt{1-\xi^2}\quad(\xi\leq 1)$$

**19.20.2**

$$\tau=+(\tfrac32\vartheta_2)^{\frac23}$$

$$\vartheta_2=\tfrac12\int_1^\xi\sqrt{s^2-1}ds=\tfrac14\xi\sqrt{\xi^2-1}-\tfrac14\operatorname{arccosh}\xi\qquad(\xi\geq 1)$$

Then for $x>0$, $a\to+\infty$

**19.20.3**

$$W(a,x)\sim\sqrt{\pi}(4a)^{-\frac14}e^{-\frac12\pi a}\left(\frac{t}{\xi^2-1}\right)^{\frac14}\mathrm{Bi}(-t)$$

**19.20.4**

$$W(a,-x)\sim 2\sqrt{\pi}(4a)^{-\frac14}e^{\frac12\pi a}\left(\frac{t}{\xi^2-1}\right)^{\frac14}\mathrm{Ai}(-t)$$

**Table 19.3** gives $\tau$ as a function of $\xi$. See [19.5] for further developments.

### 19.21. Expansions for $x$ Large and $a$ Moderate

When $x>>|a|$,

**19.21.1**

$$E(a,x)=\sqrt{2/x}\exp\{i(\tfrac14x^2-a\ln x+\tfrac12\phi_2+\tfrac14\pi)\}s(a,x)$$

**19.21.2**

$$W(a,x)=\sqrt{2k/x}\{s_1(a,x)\cos(\tfrac14x^2-a\ln x+\tfrac14\pi+\tfrac12\phi_2)-s_2(a,x)\sin(\tfrac14x^2-a\ln x+\tfrac14\pi+\tfrac12\phi_2)\}$$

**19.21.3**

$$W(a,-x)=\sqrt{2/kx}\{s_1(a,x)\sin(\tfrac14x^2-a\ln x+\tfrac14\pi+\tfrac12\phi_2)+s_2(a,x)\cos(\tfrac14x^2-a\ln x+\tfrac14\pi+\tfrac12\phi_2)\}$$

where $\phi_2$ is defined by **19.17.10** and

**19.21.4** $s(a,x)=s_1(a,x)+is_2(a,x)$

**19.21.5**

$$s_1(a,x)\sim 1+\frac{v_2}{1!2x^2}-\frac{u_4}{2!2^2x^4}-\frac{v_6}{3!2^3x^6}+\frac{u_8}{4!2^4x^8}+\dots$$

**19.21.6**

$$s_2(a,x)\sim-\frac{u_2}{1!2x^2}-\frac{v_4}{2!2^2x^4}+\frac{u_6}{3!2^3x^6}+\frac{v_8}{4!2^4x^8}-\dots$$

with

$(x\to+\infty)$

**19.21.7** $u_r+iv_r=\Gamma(r+\tfrac{1}{2}+ia)/\Gamma(\tfrac{1}{2}+ia)$

or

**19.21.8** $$s(a,x)\sim\sum_{r=0}^{\infty}(-i)^r\frac{\Gamma(2r+\frac{1}{2}+ia)}{\Gamma(\frac{1}{2}+ia)}\frac{1}{2^r r!x^{2r}}$$

## 19.22. Expansions for $a$ Large With $x$ Moderate

### (i) $a$ positive

When $a>>x^2$, with $p=\sqrt{a}$, then

**19.22.1** $W(a,x)=W(a,0)\exp(-px+v_1)$

**19.22.2** $W(a,-x)=W(a,0)\exp(px+v_2)$

where $W(a, 0)$ is given by **19.17.4**, and

**19.22.3**

$$v_1,v_2\sim\pm\frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p}+\frac{(\frac{1}{2}x)^2}{(2p)^2}\pm\frac{\frac{1}{2}x+\frac{2}{5}(\frac{1}{2}x)^5}{(2p)^3}$$
$$+\frac{2(\frac{1}{2}x)^4}{(2p)^4}\pm\frac{\frac{16}{3}(\frac{1}{2}x)^3+\frac{4}{7}(\frac{1}{2}x)^7}{(2p)^5}+\dots$$
$$(a\to+\infty)$$

The upper sign gives the first function, and the lower sign the second function.

### (ii) $a$ negative

When $-a>>x^2$, with $p=\sqrt{-a}$, then

**19.22.4**

$$W(a,x)+iW(a,-x)$$
$$=\sqrt{2}W(a,0)\exp\{v_r+i(px+\tfrac{1}{4}\pi+v_i)\}$$

where $W(a, 0)$ is given by **19.17.4**, and

**19.22.5**

$$v_r\sim-\frac{(\frac{1}{2}x)^2}{(2p)^2}+\frac{2(\frac{1}{2}x)^4}{(2p)^4}-\frac{9(\frac{1}{2}x)^2+\frac{16}{3}(\frac{1}{2}x)^6}{(2p)^6}+\dots$$
$$v_i\sim\frac{\frac{2}{3}(\frac{1}{2}x)^3}{2p}-\frac{\frac{1}{2}x+\frac{2}{5}(\frac{1}{2}x)^5}{(2p)^3}+\frac{\frac{16}{3}(\frac{1}{2}x)^3+\frac{4}{7}(\frac{1}{2}x)^7}{(2p)^5}-\dots$$
$$(a\to-\infty)$$

Further expansions of a similar type will be found in [19.3].

## 19.23. Darwin's Expansions

### (i) $a$ positive, $x^2-4a>>0$

Write

**19.23.1**

$$X=\sqrt{x^2-4a}\qquad\theta=4a\vartheta_2(x/2\sqrt{a})=\tfrac{1}{2}\int_{2\sqrt{a}}^{x}Xdx$$
$$=\tfrac{1}{4}xX-a\ln\frac{x+X}{2\sqrt{a}}$$
$$=\tfrac{1}{4}x\sqrt{x^2-4a}-a\operatorname{arccosh}\frac{x}{2\sqrt{a}}$$

(see **Table 19.3** for $\vartheta_2$), then

**19.23.2** $W(a,x)=\sqrt{2k}e^{v_r}\cos(\tfrac{1}{4}\pi+\theta+v_i)$

**19.23.3** $W(a,-x)=\sqrt{2/k}e^{v_r}\sin(\tfrac{1}{4}\pi+\theta+v_i)$

where

**19.23.4** $$v_r\sim-\tfrac{1}{2}\ln X-\frac{d_6}{X^6}+\frac{d_{12}}{X^{12}}-\dots$$
$$v_i\sim-\frac{d_3}{X^3}+\frac{d_9}{X^9}-\frac{d_{15}}{X^{15}}+\dots$$
$$(x^2-4a\to\infty)$$

and $d_{3r}$ is given by **19.23.12**.

### (ii) $a$ positive, $4a-x^2>>0$

Write

**19.23.5**

$$Y=\sqrt{4a-x^2}\qquad\theta=4a\vartheta_4(x/2\sqrt{a})$$
$$=\tfrac{1}{2}\int_0^x Ydx=\tfrac{1}{4}xY+a\arcsin\frac{x}{2\sqrt{a}}$$

(see **Table 19.3** for $\vartheta_4=\frac{1}{2}\pi-\vartheta_3$), then

**19.23.6** $W(a,x)=\exp\{-\theta+v(a,x)\}$

**19.23.7** $W(a,-x)=\exp\{\theta+v(a,-x)\}$

where

**19.23.8**

$$v(a,x)\sim-\tfrac{1}{2}\ln Y+\frac{d_3}{Y^3}+\frac{d_6}{Y^6}+\frac{d_9}{Y^9}+\dots$$
$$(x^2-4a\to-\infty)$$

and $d_{3r}$ is again given by **19.23.12.**

### (iii) $a$ negative, $x^2-4a>>0$

Write

**19.23.9**

$$X=\sqrt{x^2+4|a|}\qquad\theta=4|a|\vartheta_1(x/2\sqrt{|a|})=\tfrac{1}{2}\int_0^x Xdx$$
$$=\tfrac{1}{4}xX-a\ln\frac{x+X}{2\sqrt{|a|}}$$
$$=\tfrac{1}{4}x\sqrt{x^2+4|a|}-a\operatorname{arcsinh}\frac{x}{2\sqrt{|a|}}$$

(see **Table 19.3** for $\vartheta_1$) then

**19.23.10** $W(a,x)=\sqrt{2k}e^{v_r}\cos(\tfrac{1}{4}\pi+\theta+v_i)$

**19.23.11** $W(a,-x)=\sqrt{2/k}e^{v_r}\sin(\tfrac{1}{4}\pi+\theta+v_i)$

where $v_r$ and $v_i$ are again given by **19.23.4.** In each case the coefficients $d_{3r}$ are given by

**19.23.12**

$$d_3=-\frac{1}{a}\left(\frac{x^3}{48}-\tfrac{1}{2}ax\right)$$

$$d_6=\tfrac{3}{4}x^2+2a$$

$$d_9=\frac{1}{a^3}\left(\frac{7}{5760}x^9-\frac{7}{320}ax^7+\frac{49}{320}a^2x^5+\frac{31}{12}a^3x^3+19a^4x\right)$$

$$d_{12}=\frac{153}{8}x^4+186ax^2+80a^2$$

See [19.11] for $d_{15}, \ldots, d_{24}$, and [19.5] for an alternative form.

## 19.24. Modulus and Phase

When $a$ is positive, the function $W(a, x)$ is oscillatory when $x<-2\sqrt{a}$ and when $x>2\sqrt{a}$; when $a$ is negative, the function is oscillatory for all $x$. In such cases it is sometimes convenient to write

**19.24.1**

$$k^{-\frac{1}{2}}W(a, x)+ik^{\frac{1}{2}}W(a,-x)=E(a, x)=Fe^{i\chi} \qquad (x>0)$$

**19.24.2**

$$k^{-\frac{1}{2}}\frac{dW(a, x)}{dx}+ik^{\frac{1}{2}}\frac{dW(a,-x)}{dx}=E'(a, x)=-Ge^{i\psi} \qquad (x>0)$$

Then, when $x^2>>|a|$,

**19.24.3**

$$F\sim\sqrt{\frac{2}{x}}\left(1+\frac{a}{x^2}+\frac{10a^2-3}{4x^4}+\frac{30a^3-47a}{4x^6}+\ldots\right)$$

**19.24.4**

$$\chi\sim\tfrac{1}{4}x^2-a\ln x+\tfrac{1}{2}\phi_2+\tfrac{1}{4}\pi+\frac{4a^2-3}{8x^2}+\frac{4a^3-19a}{8x^4}+\ldots$$

**19.24.5**

$$G\sim\sqrt{\frac{x}{2}}\left(1-\frac{a}{x^2}-\frac{6a^2-5}{4x^4}-\frac{14a^3-63a}{4x^6}-\ldots\right)$$

**19.24.6**

$$\psi\sim\tfrac{1}{4}x^2-a\ln x+\tfrac{1}{2}\phi_2-\tfrac{1}{4}\pi+\frac{4a^2+5}{8x^2}+\frac{4a^3+29a}{8x^4}+\ldots$$

where $\phi_2$ is defined by **19.17.10.**

When $a<0$, $|a|>>x^2$

**19.24.7** $$F\sim\sqrt{2}W(a, 0)e^{v_r}$$

where $v_r$ is given by **19.22.5** with $p=\sqrt{-a}$. Also

**19.24.8**

$$F\sim\frac{1}{\sqrt{p}}\left(1-\frac{x^2}{(4p)^2}+\frac{\frac{5}{2}x^4+8}{(4p)^4}-\frac{\frac{15}{2}x^6+152x^2}{(4p)^6}+\ldots\right)$$

**19.24.9**

$$\chi\sim\tfrac{1}{4}\pi+px\left(1+\frac{\frac{2}{3}x^2}{(4p)^2}-\frac{\frac{2}{5}x^4+16}{(4p)^4}+\frac{\frac{4}{7}x^6+\frac{256}{3}x^2}{(4p)^6}-\ldots\right)$$

**19.24.10**

$$G\sim\sqrt{p}\left(1+\frac{x^2}{(4p)^2}-\frac{\frac{3}{2}x^4+8}{(4p)^4}+\frac{\frac{7}{2}x^6+168x^2}{(4p)^6}-\ldots\right)$$

**19.24.11**

$$\psi\sim-\tfrac{1}{4}\pi+px\left(1+\frac{\frac{2}{3}x^2}{(4p)^2}-\frac{\frac{2}{5}x^4-16}{(4p)^4}+\frac{\frac{4}{7}x^6-\frac{320}{3}x^2}{(4p)^6}-\ldots\right)$$

Again, when $a<0$, $x^2-4a\gg 0$, with $X=\sqrt{x^2+4|a|}$, then

**19.24.12** $$F\sim\sqrt{2}e^{v_r} \qquad \chi=\tfrac{1}{4}\pi+\theta+v_i$$

where $\theta$, $v_r$ and $v_i$ are given by **19.23.4** and **19.23.9.**

Another form also when $a>0$, $x^2-4a\rightarrow\infty$ is

**19.24.13**

$$F\sim\sqrt{\frac{2}{X}}\left(1-\frac{3}{4X^4}-\frac{5a}{X^6}+\frac{621}{32X^8}+\frac{1371a}{4X^{10}}-\ldots\right)$$

**19.24.14**

$$G\sim\sqrt{\frac{X}{2}}\left(1+\frac{5}{4X^4}+\frac{7a}{X^6}-\frac{835}{32X^8}-\frac{1729a}{4X^{10}}+\ldots\right)$$

while $\psi$ and $\chi$ are connected by

**19.24.15**

$$\psi-\chi\sim-\frac{1}{2}\pi+\frac{x}{X^3}\left(1-\frac{47}{6X^4}-\frac{214a}{3X^6}+\frac{14483}{40X^8}+\ldots\right)$$

## 19.25. Connections With Other Functions

### Connection With Confluent Hypergeometric and Bessel Functions

**19.25.1**

$$W(a, \pm x)=2^{-\frac{3}{4}}\left\{\sqrt{\frac{G_1}{G_3}}H(-\tfrac{3}{4}, \tfrac{1}{2}a, \tfrac{1}{4}x^2)\right.$$
$$\left.\pm\sqrt{\frac{2G_3}{G_1}}xH(-\tfrac{1}{4}, \tfrac{1}{2}a, \tfrac{1}{4}x^2)\right\}$$

where

**19.25.2**

$$H(m, n, x)=e^{-ix}{}_1F_1(m+1-in; 2m+2; 2ix)$$

**19.25.3** $$=e^{-ix}M(m+1-in, 2m+2, 2ix)$$

**19.25.4**

$$W(0, \pm x)=2^{-\frac{5}{4}}\sqrt{\pi x}\{J_{-\frac{1}{4}}(\tfrac{1}{4}x^2)\pm J_{\frac{1}{4}}(\tfrac{1}{4}x^2)\} \qquad (x\geq 0)$$

**19.25.5**

$$\frac{d}{dx}W(0,\pm x)=-2^{-\frac{9}{4}}x\sqrt{\pi x}\{J_{\frac{3}{4}}(\tfrac{1}{4}x^2)\pm J_{-\frac{3}{4}}(\tfrac{1}{4}x^2)\}\qquad (x\geq 0)$$

## 19.26. Zeros

Zeros of solutions $U(a,x)$, $V(a,x)$ of **19.1.2** occur only for $|x|<2\sqrt{-a}$ when $a$ is negative. A single exceptional zero is possible, for any $a$, in the general solution; neither $U(a,x)$ nor $V(a,x)$ has such a zero for $x>0$.

Approximations may be obtained by reverting the series for $\psi$ (or $\chi$ for zeros of derivatives) in **19.11**, giving $\psi$ (or $\chi$) values that are multiples of $\frac{1}{4}\pi$, odd multiples for $U(a,x)$, even multiples for $V(a,x)$. Writing

$$\alpha=(\tfrac{1}{2}r-\tfrac{1}{2}a-\tfrac{1}{4})\pi$$

as an approximation to a zero of the function, or

$$\beta=(\tfrac{1}{2}r-\tfrac{1}{2}a+\tfrac{1}{4})\pi$$

as an approximation to a zero of the derivative, we obtain for the corresponding zero $c$ or $c'$, with $-a=p^2$ the expressions

**19.26.1** $$c\approx\frac{\alpha}{p}+\frac{2\alpha^3-3\alpha}{48p^5}+\frac{52\alpha^5-240\alpha^3+315\alpha}{7680p^9}+\ldots$$

**19.26.2** $$c'\approx\frac{\beta}{p}+\frac{2\beta^3+3\beta}{48p^5}+\frac{52\beta^5+280\beta^3-285\beta}{7680p^9}+\ldots$$

These expansions, however, are of little value in the neighborhood of the turning point $x=2\sqrt{-a}$. Here first approximations may be obtained by use of the formulas of **19.7.** If $a_n$ (negative) is a zero of $\mathrm{Ai}(t)$, the corresponding zero $c$ of $U(a,x)$ is obtained approximately by solving

**19.26.3**

$$\vartheta_3=\tfrac{1}{4}\{\arccos\ \xi-\xi\sqrt{1-\xi^2}\}=\frac{(-a_n)^{\frac{3}{2}}}{6|a|}$$

$$c=2\sqrt{|a|}\xi\qquad (a<<0)$$

This may be done by inverse use of **Table 19.3.** For a zero of $V(a,x)$, $a_n$ must be replaced by $b_n$, a zero of $\mathrm{Bi}(t)$. For further developments see [19.5].

Zeros of solutions $W(a,x)$, $W(a,-x)$ of **19.1.3** occur for $|x|>2\sqrt{a}$ when $a$ is positive; the general solution may, however, have a single zero between $-2\sqrt{a}$ and $+2\sqrt{a}$. If $a$ is negative, zeros are unrestricted in range.

Approximations may be obtained by reverting the series for $\psi$ (or $\chi$) in **19.24.** With $-a=p^2$, $\alpha=(\frac{1}{2}r-\frac{1}{4})\pi$, $\beta=(\frac{1}{2}r+\frac{1}{4})\pi$, $r\geq 0$ being an odd integer for $W(a,x)$ or its derivative, or an even integer for $W(a,-x)$ or its derivative, the zeros $\pm c$, $\pm c'$ have expansions

**19.26.4** $$c\approx\frac{\alpha}{p}-\frac{2\alpha^3-3\alpha}{48p^5}+\frac{52\alpha^5-240\alpha^3+315\alpha}{7680p^9}+\ldots$$

**19.26.5** $$c'\approx\frac{\beta}{p}-\frac{2\beta^3+3\beta}{48p^5}+\frac{52\beta^5+280\beta^3-285\beta}{7680p^9}+\ldots$$

When $x$ is large and $a$ moderate, we may solve inversely the series **19.24.4** or **19.24.6** with $\alpha=\frac{1}{2}(r\pi-\frac{1}{2}\pi-\phi_2)$, $\beta=\frac{1}{2}(r\pi+\frac{1}{2}\pi-\phi_2)$, $r$ odd or even as above; the presence of the logarithm makes it inconvenient to revert formally.

The expansions **19.26.4** and **19.26.5** fail when $x$ is in the neighborhood of $2\sqrt{|a|}$. When $a$ is positive, a zero $c$ of $W(a,-x)$ is obtained approximately by solving

**19.26.6**

$$\vartheta_2=\tfrac{1}{4}\{\xi\sqrt{\xi^2-1}-\operatorname{arccosh}\ \xi\}=\frac{(-a_n)^{\frac{3}{2}}}{6a}$$

$$c=2\sqrt{a}\xi\qquad (a>>0)$$

with the aid of **Table 19.3.** For a zero of $W(a,x)$ we replace $a_n$ by $b_n$. When $a$ is negative we solve, again with the aid of **Table 19.3,**

**19.26.7**

$$\vartheta_1=\tfrac{1}{4}\{\xi\sqrt{\xi^2+1}+\operatorname{arcsinh}\ \xi\}=\frac{(n-\frac{1}{4})\pi}{4|a|}$$

$$c=2\sqrt{|a|}\xi\qquad (-a>>0)$$

where $n=1, 2, 3, \ldots$ for an approximate zero of $W(a,-x)$, and $n=\frac{1}{2}, \frac{3}{2}, \frac{5}{2}, \ldots$ for an approximate zero of $W(a,x)$. Further developments are given in [19.5].

Any of the approximations to zeros obtained above may readily be improved as follows:

Let $c$ be a zero of $y$, and $c'$ a zero of $y'$, where $y$ is a solution of

**19.26.8** $$y''-Iy=0$$

Here $I=a\pm\frac{1}{4}x^2$, $I'=\pm\frac{1}{2}x$, $I''=\pm\frac{1}{2}$; the method is general and the following formulae may be used whenever $I'''=0$. Then if $\gamma$, $\gamma'$ are approximations to the zeros $c$, $c'$ and

**19.26.9** $$u=y(\gamma)/y'(\gamma)\qquad v=y'(\gamma')/I^2y(\gamma')$$

with $I\equiv I(\gamma)$ or $I\equiv I(\gamma')$ respectively, then

**19.26.10**

$$c\sim\gamma-u-\tfrac{1}{3}Iu^3+\tfrac{1}{12}I'u^4 -(\tfrac{1}{60}I''+\tfrac{1}{5}I^2)u^5+\tfrac{11}{90}II'u^6+\ldots$$

**19.26.11**

$$y'(c)\sim y'(\gamma)\{1-\tfrac{1}{2}Iu^2+\tfrac{1}{6}I'u^3 -(\tfrac{1}{24}I''+\tfrac{1}{8}I^2)u^4+\tfrac{7}{60}II'u^5+\ldots\}$$

**19.26.12**

$$c'\sim\gamma'-Iv-\tfrac{1}{2}II'v^2+(\tfrac{1}{6}I^2I''-\tfrac{1}{2}II'^2-\tfrac{1}{3}I^4)v^3 +(\tfrac{5}{12}I^2I'I''-\tfrac{5}{8}II'^3-\tfrac{5}{12}I^4I')v^4+\ldots$$

**19.26.13**

$$y(c')\sim y(\gamma')\{1-\tfrac{1}{2}I^3v^2-\tfrac{1}{6}I^3I'v^3 -(\tfrac{1}{8}I^3I'^2-\tfrac{1}{24}I^4I''+\tfrac{1}{8}I^6)v^4+\ldots\}$$

The process can be repeated, if necessary, using as many terms at any stage as seems convenient.

Note the relations, holding at zeros,

**19.26.14** $$U'(a,c)=-\sqrt{2/\pi}/V(a,c)$$

**19.26.15** $$V'(a,c')=\sqrt{2/\pi}/U(a,c')$$

**19.26.16** $$W'(a,c)=-1/W(a,-c)$$

**19.26.17**

$$W(a,c')=1/\left\{\frac{d}{dx}W(a,-x)\right\}_{x=c'}=-1/W'(a,-c')$$

### 19.27. Bessel Functions of Order $\pm\frac{1}{4}$, $\pm\frac{3}{4}$ as Parabolic Cylinder Functions

Most applications of these functions refer to cases where parabolic cylinder functions would be more appropriate. We have

**19.27.1** $$J_{\pm\frac{1}{4}}(\tfrac{1}{4}x^2)=\frac{2^{\frac{1}{4}}}{\sqrt{\pi x}}\{W(0,-x)\mp W(0,x)\}$$

**19.27.2** $$J_{\pm\frac{3}{4}}(\tfrac{1}{4}x^2)=\frac{-2^{\frac{3}{4}}}{x\sqrt{\pi x}}\{W(0,x)\pm W(0,-x)\}$$

Functions of other orders may be obtained by use of the recurrence relation **10.1.22**, which here becomes

**19.27.3** $$\tfrac{1}{4}x^2J_{\nu+1}(\tfrac{1}{4}x^2)-2\nu J_\nu(\tfrac{1}{4}x^2)+\tfrac{1}{4}x^2J_{\nu-1}(\tfrac{1}{4}x^2)=0$$

Again

**19.27.4** $$I_{-\frac{1}{4}}(\tfrac{1}{4}x^2)+I_{\frac{1}{4}}(\tfrac{1}{4}x^2)=\frac{2}{\sqrt{x}}V(0,x)$$

**19.27.5**

$$\frac{\sqrt{2}}{\pi}K_{\frac{1}{4}}(\tfrac{1}{4}x^2)=I_{-\frac{1}{4}}(\tfrac{1}{4}x^2)-I_{\frac{1}{4}}(\tfrac{1}{4}x^2)=\frac{2}{\sqrt{\pi x}}U(0,x)$$

**19.27.6** $$I_{-\frac{3}{4}}(\tfrac{1}{4}x^2)+I_{\frac{3}{4}}(\tfrac{1}{4}x^2)=-\frac{4}{x\sqrt{x}}\frac{d}{dx}V(0,x)$$

**19.27.7**

$$\frac{\sqrt{2}}{\pi}K_{\frac{3}{4}}(\tfrac{1}{4}x^2)=I_{-\frac{3}{4}}(\tfrac{1}{4}x^2)-I_{\frac{3}{4}}(\tfrac{1}{4}x^2) =-\frac{4}{x\sqrt{\pi x}}\frac{d}{dx}U(0,x)$$

As before, Bessel functions of other orders may be obtained by use of the recurrence relation **10.2.23**, which here becomes

**19.27.8** $$\tfrac{1}{4}x^2I_{\nu+1}(\tfrac{1}{4}x^2)+2\nu I_\nu(\tfrac{1}{4}x^2)-\tfrac{1}{4}x^2I_{\nu-1}(\tfrac{1}{4}x^2)=0$$

**19.27.9** $$\tfrac{1}{4}x^2K_{\nu+1}(\tfrac{1}{4}x^2)-2\nu K_\nu(\tfrac{1}{4}x^2)-\tfrac{1}{4}x^2K_{\nu-1}(\tfrac{1}{4}x^2)=0$$

## Numerical Methods

### 19.28. Use and Extension of the Tables

For $U(a, x)$, $V(a, x)$ and $W(a, x)$, interpolation $x$-wise may be carried out to 5-figure accuracy almost everywhere by using 5-point or 6-point Lagrangian interpolation. For $|a|\leq 1$, comparable accuracy $a$-wise may be obtained with 5- or 6-point interpolation.

For $|a|>1$, $U(a, x)$ and $V(a, x)$ may be obtained by use of recurrence relations from two values, possibly obtained by interpolation, with $|a|\leq 1$; such a procedure is not available for $W(a, \pm x)$, $|a|>1$.

In cases where straightforward use of the $a$-wise recurrence relation results in loss of accuracy by cancellation of leading digits, it may be worth while to remark that greater accuracy is usually attainable by use of the recurrence relation in the reverse direction, from arbitrary starting values (often 1 and 0) for two values of $a$ somewhat beyond the last value desired. This is because the recurrence relation is a second order homogeneous linear difference equation, and has two independent solutions. Loss of accuracy by cancellation occurs when the solution desired is diminishing as $a$ varies, while the companion solution is increasing. By reversing the direction of progress in $a$, the roles of the two solutions are interchanged, and the contribution of the desired solution now increases, while the unwanted solution diminishes to the point of negligibility. By starting sufficiently beyond the last value of $a$ for which the function is desired, we can ensure that the unwanted solution is negligible but, because the starting values were arbitrary, we have an unknown multiple of the solution desired. The computation is then carried back until a value of $a$ with $|a|\leq 1$ is reached, when the precise multiple that we have of the desired solution may be determined and hence removed throughout. Compare also **9.12, Example 1.**

**Example 1.** Evaluate $U(a, 5)$ for $a=5, 6, 7, \ldots$, using **19.6.4.**

$$(a+\tfrac{1}{2})U(a+1, x)+xU(a, x)-U(a-1, x)=0$$

| $a$ | Forward Recurrence | Backward Recurrence | Final Values |
|---|---|---|---|
| 3 | (−6) 5.2847* | (12) 1.59035 | (−6) 5.2847** |
| 4 | (−7) 9.172* | (11) 2.76028 | (−7) 9.1724 |
| 5 | (−7) 1.5527 | (10) 4.67131 | (−7) 1.55227 |
| 6 | (−8) 2.5609 | (9) 7.72041 | (−8) 2.5655 |
| 7 | (−9) 4.1885 | (9) 1.24785 | (−9) 4.1466 |
| 8 | (−10) 6.2220 | (8) 1.97488 | (−10) 6.5625 |

| 14 | | 2111 | (−15) 7.01 |
| 15 | | 292 | (−16) 9.7 |
| 16 | | 42 | |
| 17 | | 5 | |
| 18 | | 1+ | |
| 19 | | 0+ | |

*From tables. +Starting values.

**This value was used to obtain the constant multiplier $\frac{d}{k^*}=\frac{(-6)5.2847}{(12)1.59035}=(-18)3.32298$ for converting the previous column into this one.

The second column shows forward recurrence starting with values at $a=3, 4$ from **Table 19.1.** Backward recurrence starts with values 0 and 1 at $a=19$ and 18, containing a multiple $kU(a, 5)$ and a subsequently negligible multiple of the other solution $\Gamma(\frac{1}{2}-a)V(a, 5)$. Rounding errors convert $kU(a, x)$ into $k^*U(a, x)$ *without affecting the values in the last column.* The value of $1/k^*$ is identified from the known value of $U(3, 5)$, and used to obtain the final column by multiplying throughout by $1/k^*$. The improvement in $U(5, 5)$ is evident by comparison with **Table 19.1.**

*Derivatives.* These are not tabulated here. Since the functions $U(a,x)$, $V(a,x)$ and $W(a,x)$ satisfy differential equations, values of derivatives are often required.

For all these functions the equation is second order with first derivative absent, so that *second derivatives* may be readily obtained from function values by use of the differential equation.

*First derivatives* can be obtained for $U(a,x)$ and $V(a,x)$ by applying the appropriate recurrence relations **19.6.1–2.** If less accuracy is needed they can be found by use of mean central differences of $U(a,x)$, $V(a,x)$ and also of $W(a,x)$ with the formula

$$hu'=h\frac{du}{dx}=\mu\delta u-\tfrac{1}{6}\mu\delta^3 u+\tfrac{1}{30}\mu\delta^5 u-\ldots$$

using $h=.1$; this usually gives a 3- or 4-figure value of $du/dx$.

If greater accuracy is needed for $dW(a, x)/dx$ it may be obtained by evaluating $d^2W/dx^2$ with the help of the differential equation satisfied by $W$ and integrating this second derivative numerically. This requires one accurate value of $dW/dx$ to start off the integration; we describe two methods for obtaining this, both making use of the difference between two fairly widely separated values of $W$, for example, separated by 5 or 10 tabular intervals.

(i) Write $f_r$, $f'_r$, $f''_r$ for $W(a, x_0+rh)$ and its first two derivatives, then $f'_0$ may be found from

$$hf'_0=\frac{1}{2n}(f_n-f_{-n})-\frac{h^2}{2n}\sum_{1}^{n-1}(n-r)(f''_r-f''_{-r})$$
$$-\frac{h^2}{2n}\{\tfrac{1}{12}-\tfrac{1}{240}\delta^2+\tfrac{31}{60480}\delta^4-\ldots\}(f''_n-f''_{-n})$$
$$-h^2\{\tfrac{1}{12}\mu\delta-\tfrac{11}{720}\mu\delta^3+\tfrac{191}{60480}\mu\delta^5-\ldots\}f''_0$$

(ii) Consider a solution $y$ of the differential equation for $W(a, x)$, namely $y''=(-\frac{1}{4}x^2+a)y$. If we are given values $y$ and $y'$ at a particular $x=x_0$ and write $T_n=H^n y^{(n)}/n!$, $T_{-1}=T_{-2}=0$, then we may compute $T_2$, $T_3$, $T_4$, $\ldots$ in succession by use of the recurrence relation obtained from the differential equation,

$$T_{n+2}=\frac{H^2}{(n+1)(n+2)}[(-\tfrac{1}{4}x_0^2+a)T_n-\tfrac{1}{2}Hx_0T_{n-1}$$
$$-\tfrac{1}{4}H^2T_{n-2}]$$

These are computed, to a fixed number of decimals until they become negligible, thus giving

$$y(x_0\pm H)=T_0\pm T_1+T_2\pm T_3+\ \ldots$$

This may be applied, with $H=rh$, $h$ being the tabular interval, and $r$ a small integer, say $r=5$, to the solutions $y=y_1$, $y=y_2$ having

$$y_1(x_0)=W(a, x_0)\qquad y'_1(x_0)=W^{*\prime}(a, x_0)$$
$$y_2(x_0)=0\qquad y'_2(x_0)=1$$

in which $W^{*\prime}(a, x_0)$ is an approximation to $W'(a, x_0)$, not necessarily a good one; it may be obtained from differences, for example. We thus obtain $y_1(x_0 \pm H)$ and $y_2(x_0 \pm H)$.

Now suppose

$$W'(a, x_0) = W^{*\prime}(a, x_0) + \lambda$$

then, for all $x$

$$W(a, x) = y_1(x) + \lambda y_2(x)$$

and in particular

$$W(a, x_0 \pm H) = y_1(x_0 \pm H) + \lambda y_2(x_0 \pm H)$$

The values of $W(a, x_0 \pm H)$ may be read from the tables and two independent estimates of $\lambda$ obtained, whence

$$W'(a, x_0) = W^{*\prime}(a, x_0) + \lambda$$

to a suitable accuracy.

**Example 2.** Evaluate $W'(-3, 1)$ using $r=5$. From **Table 19.2**

$W(-3, .5) = -.05857$ $\qquad$ $W(-3, 1) = -.61113$

$W(-3, 1.5) = -.69502$

(i) Using the first method

| $x$ | $W(-3, x)$ | $W''(-3, x)$ | $\delta$ | $\delta^2$ | $\delta^3$ |
|---|---|---|---|---|---|
| 0.4 | +0.07298 | −0.22186 | | | |
| 0.5 | −.05857 | +.17937 | | +131 | |
| 0.6 | −.18832 | .58191 | | | |
| 0.7 | −.31226 | .97503 | | | |
| 0.8 | −.42646 | 1.34761 | | | |
| | | | 34081 | | |
| 0.9 | −.52722 | 1.68842 | | | |
| | | | 29775 | | −1095 |
| 1.0 | −.61113 | 1.98617 | | | |
| | | | 24374 | | −1032 |
| 1.1 | −.67522 | 2.22991 | | | |
| | | | 17941 | | |
| 1.2 | −.71706 | 2.40932 | | | |
| 1.3 | −.73488 | 2.51513 | | | |
| 1.4 | −.72761 | 2.53936 | | | |
| 1.5 | −.69502 | 2.47601 | | −9129 | |
| 1.6 | −.63774 | 2.32137 | | | |

The fifth decimal in $W''(-3, x)$ is only a guard figure which is hardly needed. Only the differences needed have been computed.

Then

$$\tfrac{1}{10}W'(-3, 1)$$

$$= \tfrac{1}{10}(-.69502 + .05857) - \frac{1}{1000}(10.38874)$$

$$-\frac{1}{1000}\left\{\tfrac{1}{12}(2.29664) - \frac{1}{240}(-.09260)\right\}$$

$$-\frac{1}{100}\left\{\frac{1}{24}(.54149) - \frac{11}{1440}(-.02127)\right\}$$

$$= -.0636450 - .0103887 - .0001918 - .0002272$$

$$= -.0744527$$

Thus $W'(-3, 1) = -.74453$. This might have an error up to about $1\frac{1}{2}$ units in the last figure but is, in fact, correct to 5 decimals.

(ii) Using the second method, with

$y_1(1) = W(-3, 1) = -.61113$ $\qquad$ to 5 decimals

$y_1'(1) = -.745$ $\qquad$ to about 3 decimals

the following values result, with $H=.5$,

| | $y_1$ | $y_2$ | $W(-3, x) = y_1 + \lambda y_2$ |
|---|---|---|---|
| $T_0$ | − .61113 | .0000 | At $x=1.5$ |
| $T_1$ | − .37250 | +.5000 | $x - .695223 + .4323\lambda$ |
| | | | $= -.69502$ |
| $T_2$ | + .24827 2 | .0000 | $\lambda = .000203/.4323$ |
| $T_3$ | + 5680 9 | − 677 | $= .000470$ |
| $T_4$ | − 1407 4 | − 26 | So $W'(-3, 1)$ |
| | | | $= -.745 + \lambda$ |
| | | | $= -.744530$ |
| $T_5$ | − 279 3 | + 24 | At $x=.5$ |
| $T_6$ | + 13 4 | + 2 | $-.058363 - .4371\lambda$ |
| | | | $= -.05857$ |
| $T_7$ | + 5 4 | | $\lambda = .000207/.4371$ |
| $T_8$ | + 5 | | $= .000474$ |
| $y(1.5)$ | −.695223 | +.4323 | So $W'(-3, 1)$ |
| $y(.5)$ | −.058363 | −.4371 | $= -.745 + \lambda$ |
| | | | $= -.744526$ |

Thus $W'(-3, 1) = -.74453$ which is correct to 5 decimals.

**Example 3.** Evaluate the positive zero of $U(-3, x)$.

We use **19.7.3** to obtain a first approximation, see **19.26.3.** The appropriate zero of $\mathrm{Ai}(t)$ is at

$$t = (4|a|)^{\frac{2}{3}}\tau = -2.338$$

whence

$$\tau = -(2.338) \times (12)^{-\frac{2}{3}} = -.4461$$

Hence, from **Table 19.3,** $\xi = .3990$ and the approximate zero is $x = 2\sqrt{|a|}\,\xi = 1.382$.

We improve this by using **19.26.10,** but take, for convenience, $x=1.4$ as an approximation, so that the value of $U$ can be read directly from the tables. $U'$ can be obtained as in the section following **Example 1.**

We find

$U(-3, 1.4) = .02627$ $\qquad$ $U'(-3, 1.4) = 2.0637$

Then **19.26.9** gives

$u = U/U' = .012730$ $\qquad$ $I = -2.51$

$I' = .7$ $\qquad$ $I'' = .5$

and

$$c=1.4-.012730+.000002=1.38727$$

which is correct to 5 decimals, while **19.26.11** gives

$$y'(c)=2.0637(1+.000203)=2.0641$$

compared with the correct value 2.06416.

**Table 19.3**

## AUXILIARY FUNCTIONS

The functions $\vartheta_1, \vartheta_2, \vartheta_3$ of **19.10** and **19.23** are needed in Darwin's expansion and also the function $\tau$ of **19.7** and **19.20**.

| $\xi$ | $\vartheta_1$ | $\vartheta_3$ | $\tau$ | $\xi$ | $\vartheta_1$ | $\vartheta_2$ | $\tau$ |

|  | $\begin{bmatrix}(-4)6\\4\end{bmatrix}$ | $\begin{bmatrix}(-3)2\\6\end{bmatrix}$ | $\begin{bmatrix}(-4)3\\3\end{bmatrix}$ |  | $\begin{bmatrix}(-4)6\\3\end{bmatrix}$ | $\begin{bmatrix}(-4)7\\3\end{bmatrix}$ | $\begin{bmatrix}(-4)1\\3\end{bmatrix}$ |

When interpolating for $\vartheta_2$ and $\vartheta_3$ for $\xi$ near unity, it is better to interpolate for $\tau$ and then use

$$\vartheta_2 = \frac{2}{3}\tau^{3/2} \text{ or } \vartheta_3 = \frac{2}{3}(-\tau)^{3/2}.$$

# 20. Mathieu Functions

## Mathematical Properties

### 20.1. Mathieu's Equation

#### Canonical Form of the Differential Equation

**20.1.1**
$$\frac{d^2y}{dv^2}+(a-2q\cos 2v)y=0$$

#### Mathieu's Modified Differential Equation

**20.1.2**
$$\frac{d^2f}{du^2}-(a-2q\cosh 2u)f=0 \qquad (v=iu,\, y=f)$$

#### Relation Between Mathieu's Equation and the Wave Equation for the Elliptic Cylinder

The wave equation in Cartesian coordinates is

**20.1.3**
$$\frac{\partial^2 W}{\partial x^2}+\frac{\partial^2 W}{\partial y^2}+\frac{\partial^2 W}{\partial z^2}+k^2W=0$$

A solution $W$ is obtainable by separation of variables in elliptical coordinates. Thus, let

$$x=\rho\cosh u\cos v;\; y=\rho\sinh u\sin v;\; z=z;$$

$\rho$ a positive constant; **20.1.3** becomes

**20.1.4**

*
$$\frac{\partial^2 W}{\partial z^2}+\frac{2}{\rho^2(\cosh 2u-\cos 2v)}\left(\frac{\partial^2 W}{\partial u^2}+\frac{\partial^2 W}{\partial v^2}\right)+k^2W=0$$

Assuming a solution of the form

$$W=\varphi(z)f(u)g(v)$$

and substituting the above into **20.1.4** one obtains, after dividing through by $W$,

$$\frac{1}{\varphi}\frac{d^2\varphi}{dz^2}+G=0$$

where

*
$$G=\frac{2}{\rho^2(\cosh 2u-\cos 2v)}\left\{\frac{d^2f}{du^2}\frac{1}{f}+\frac{d^2g}{dv^2}\frac{1}{g}\right\}+k^2$$

Since $z$, $u$, $v$ are independent variables, it follows that

**20.1.5**
$$\frac{d^2\varphi}{dz^2}+c\varphi=0$$

where $c$ is a constant.

Again, from the fact that $G=c$ and that $u$, $v$ are independent variables, one sets

**20.1.6**

*
$$a=\frac{d^2f}{du^2}\frac{1}{f}+\frac{(k^2-c)}{2}\rho^2\cosh 2u$$

$$a=-\frac{d^2g}{dv^2}\frac{1}{g}+\frac{(k^2-c)}{2}\rho^2\cos 2v$$
*

where $a$ is a constant. The above are equivalent to **20.1.1** and **20.1.2**. The constants $c$ and $a$ are often referred to as *separation constants*, due to the role they play in **20.1.5** and **20.1.6**.

For some physically important solutions, the function $g$ must be periodic, of period $\pi$ or $2\pi$. It can be shown that there exists a countably infinite set of *characteristic values* $a_r(q)$ which yield even periodic solutions of **20.1.1**; there is another countably infinite sequence of *characteristic values* $b_r(q)$ which yield odd periodic solutions of **20.1.1.**

It is known that there exist periodic solutions of period $k\pi$, where $k$ is any positive integer. In what follows, however, the term *characteristic value* will be reserved for a value associated with solutions of period $\pi$ or $2\pi$ only. These characteristic values are of basic importance to the general theory of the differential equation for arbitrary parameters $a$ and $q$.

#### An Algebraic Form of Mathieu's Equation

**20.1.7**
$$(1-t^2)\frac{d^2y}{dt^2}-t\frac{dy}{dt}+(a+2q-4qt^2)y=0 \qquad (\cos v=t)$$

#### Relation to Spheroidal Wave Equation

**20.1.8**
$$(1-t^2)\frac{d^2y}{dt^2}-2(b+1)t\frac{dy}{dt}+(c-4qt^2)y=0$$
*

Thus, Mathieu's equation is a special case of **20.1.8,** with $b=-\frac{1}{2}$, $c=a+2q$.

### 20.2. Determination of Characteristic Values

A solution of **20.1.1** with $v$ replaced by $z$, having period $\pi$ or $2\pi$ is of the form

**20.2.1**
$$y=\sum_{m=0}^{\infty}(A_m\cos mz+B_m\sin mz)$$

where $B_0$ can be taken as zero. If the above is substituted into **20.1.1** one obtains

**20.2.2**
$$\sum_{m=-2}^{\infty}[(a-m^2)A_m-q(A_{m-2}+A_{m+2})]\cos mz$$
$$+\sum_{m=-1}^{\infty}[(a-m^2)B_m-q(B_{m-2}+B_{m+2})]\sin mz=0$$
$$A_{-m},\, B_{-m}=0 \qquad m>0$$

---

*See page II.

Equation **20.2.2** can be reduced to one of four simpler types, given in **20.2.3** and **20.2.4** below

**20.2.3** $$y_0=\sum_{m=0}^{\infty} A_{2m+p}\cos(2m+p)z, \qquad p=0 \text{ or } 1$$

**20.2.4** $$y_1=\sum_{m=0}^{\infty} B_{2m+p}\sin(2m+p)z, \qquad p=0 \text{ or } 1$$

If $p=0$, the solution is of period $\pi$; if $p=1$, the solution is of period $2\pi$.

### Recurrence Relations Among the Coefficients

Even solutions of period $\pi$:

**20.2.5** $$aA_0-qA_2=0$$

**20.2.6** $$(a-4)A_2-q(2A_0+A_4)=0$$

**20.2.7** $$(a-m^2)A_m-q(A_{m-2}+A_{m+2})=0 \qquad (m\geq 3)$$

Even solutions of period $2\pi$:

**20.2.8** $$(a-1)A_1-q(A_1+A_3)=0,$$

along with **20.2.7** for $m\geq 3$.

Odd solutions of period $\pi$:

**20.2.9** $$(a-4)B_2-qB_4=0$$

[*] **20.2.10** $$(a-m^2)B_m-q(B_{m-2}+B_{m+2})=0 \qquad (m\geq 3)$$

Odd solutions of period $2\pi$:

**20.2.11** $$(a-1)B_1+q(B_1-B_3)=0,$$

along with **20.2.10** for $m\geq 3$.

Let

**20.2.12** $$Ge_m=A_m/A_{m-2},\ Go_m=B_m/B_{m-2};$$

$G_m=Ge_m$ or $Go_m$ when the same operations apply to both, and no ambiguity is likely to arise. Further let

**20.2.13** $$V_m=(a-m^2)/q.$$

Equations **20.2.5–20.2.7** are equivalent to

**20.2.14** $$Ge_2=V_0;\ Ge_4=V_2-\frac{2}{Ge_2}$$

**20.2.15** $$G_m=1/(V_m-G_{m+2}) \qquad (m\geq 3),$$

for even solutions of period $\pi$.

Similarly

**20.2.16** $V_1-1=Ge_3$; for even solutions of period $2\pi$, along with **20.2.15**

**20.2.17** $V_1+1=Go_3$, for odd solutions of period $2\pi$, along with **20.2.15**

**20.2.18** $V_2=Go_4$, for odd solutions of period $\pi$, along with **20.2.15**

These three-term recurrence relations among the coefficients indicate that every $G_m$ can be developed into two types of continued fractions. Thus **20.2.15** is equivalent to

**20.2.19**

$$G_m=\frac{1}{V_m-G_{m+2}}=\frac{1}{V_m-}\,\frac{1}{V_{m+2}-}\,\frac{1}{V_{m+4}-}\cdots \quad (m\geq 3)$$

**20.2.20**

$$G_{m+2}=V_m-1/G_m$$

$$=V_m-\frac{1}{V_{m-2}-}\,\frac{1}{V_{m-4}-}\cdots\frac{\varphi_0}{V_{0+d}+\varphi_1} \qquad (m\geq 3)$$

where

$\varphi_1=d=0;\ \varphi_0=2$, if $G_{m+2}=A_{2s}/A_{2s-2}$

$\varphi_1=d=\varphi_0=0$, if $G_{m+2}=B_{2s}/B_{2s-2}$

$\varphi_1=-1;\ \varphi_0=d=1$, if $G_{m+2}=A_{2s+1}/A_{2s-1}$

$\varphi_1=d=\phi_0=1$, if $G_{m+2}=B_{2s+1}/B_{2s-1}$

The four choices of the parameters $\varphi_1$, $\varphi_0$, $d$ correspond to the four types of solutions **20.2.3–20.2.4**. Hereafter, it will be convenient to separate the characteristic values $a$ into two major subsets:

$a=a_r$, associated with even periodic solutions

$a=b_r$, associated with odd periodic solutions

If **20.2.19** is suitably combined with **20.2.13–20.2.18** there result four types of continued fractions, the roots of which yield the required characteristic values

**20.2.21** $$V_0-\frac{2}{V_2-}\,\frac{1}{V_4-}\,\frac{1}{V_6-}\cdots=0 \qquad \text{Roots: } a_{2r}$$

**20.2.22**

$$V_1-1-\frac{1}{V_3-}\,\frac{1}{V_5-}\,\frac{1}{V_7-}\cdots=0 \qquad \text{Roots: } a_{2r+1}$$

**20.2.23** $$V_2-\frac{1}{V_4-}\,\frac{1}{V_6-}\,\frac{1}{V_8-}\cdots=0 \qquad \text{Roots: } b_{2r}$$

**20.2.24**

$$V_1+1-\frac{1}{V_3-}\,\frac{1}{V_5-}\,\frac{1}{V_7-}\cdots=0 \qquad \text{Roots: } b_{2r+1}$$

If $a$ is a root of **20.2.21–20.2.24**, then the corresponding solution exists and is an entire function of $z$, for general complex values of $q$.

If $q$ is real, then the Sturmian theory of second order linear differential equations yields the following:

---

[*] See page II.

(a) For a fixed real $q$, characteristic values $a_r$ and $b_r$ are real and distinct, if $q \neq 0$; $a_0 < b_1 < a_1 < b_2 < a_2 < \ldots$, $q > 0$ and $a_r(q)$, $b_r(q)$ approach $r^2$ as $q$ approaches zero.

(b) A solution of **20.1.1** associated with $a_r$ or $b_r$ has $r$ zeros in the interval $0 \leq z < \pi$, ($q$ real).

(c) The form of **20.2.21** and **20.2.23** shows that if $a_{2r}$ is a root of **20.2.21** and $q$ is different from zero, then $a_{2r}$ cannot be a root of **20.2.23**; similarly, no root of **20.2.22** can be a root of **20.2.24** if $q \neq 0$. It may be shown from other considerations that for a given point $(a, q)$ there can be at most one periodic solution of period $\pi$ or $2\pi$ if $q \neq 0$. This no longer holds for solutions of period $s\pi$, $s \geq 3$; for these all solutions are periodic, if one is.

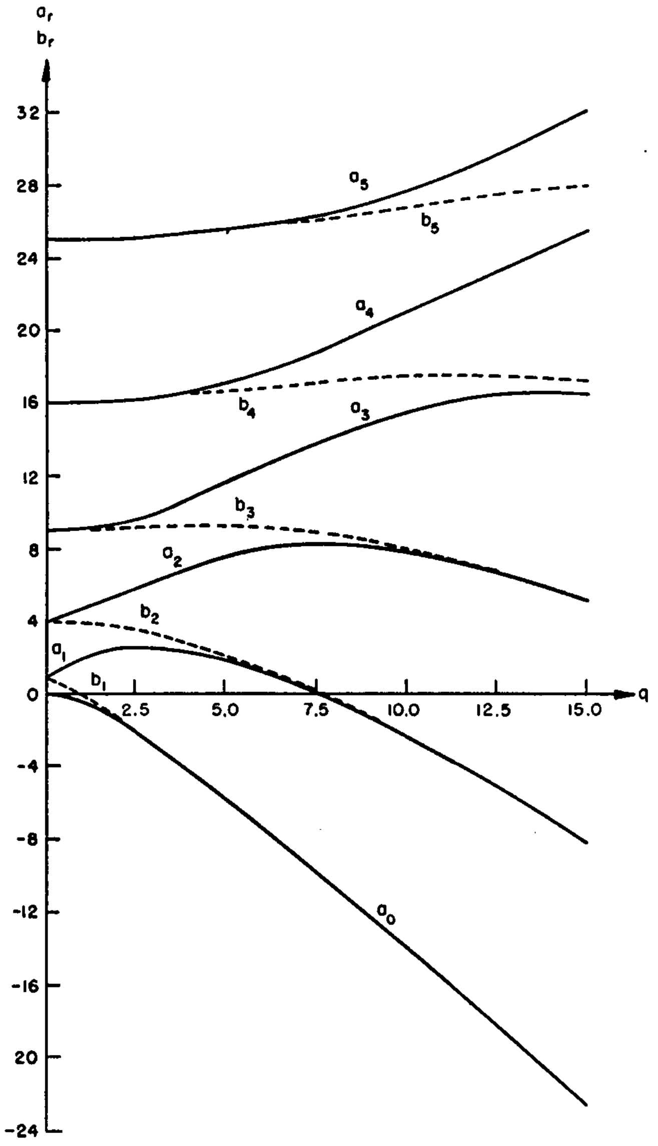

FIGURE 20.1. *Characteristic Values $a_r$, $b_r$* $r=0,1(1)5$

### Power Series for Characteristic Values

**20.2.25**

$$a_0(q) = -\frac{q^2}{2} + \frac{7q^4}{128} - \frac{29q^6}{2304} + \frac{68687q^8}{18874368} + \ldots$$

$$\left.\begin{aligned} a_1(-q) \\ b_1(q) \end{aligned}\right\} = 1 - q - \frac{q^2}{8} + \frac{q^3}{64} - \frac{q^4}{1536} - \frac{11q^5}{36864} + \frac{49q^6}{589824} - \frac{55q^7}{9437184} - \frac{83q^8}{35389440} + \ldots$$

$$b_2(q) = 4 - \frac{q^2}{12} + \frac{5q^4}{13824} - \frac{289q^6}{79626240} + \frac{21391q^8}{458647142400} + \ldots$$

$$a_2(q) = 4 + \frac{5q^2}{12} - \frac{763q^4}{13824} + \frac{1002401q^6}{79626240} - \frac{1669068401q^8}{458647142400} + \ldots$$

$$\left.\begin{aligned} a_3(-q) \\ b_3(q) \end{aligned}\right\} = 9 + \frac{q^2}{16} - \frac{q^3}{64} + \frac{13q^4}{20480} + \frac{5q^5}{16384} - \frac{1961q^6}{23592960} + \frac{609q^7}{104857600} + \ldots$$

$$b_4(q) = 16 + \frac{q^2}{30} - \frac{317q^4}{864000} + \frac{10049q^6}{2721600000} + \ldots$$

$$a_4(q) = 16 + \frac{q^2}{30} + \frac{433q^4}{864000} - \frac{5701q^6}{2721600000} + \ldots$$

$$\left.\begin{aligned} a_5(-q) \\ b_5(q) \end{aligned}\right\} = 25 + \frac{q^2}{48} + \frac{11q^4}{774144} - \frac{q^5}{147456} + \frac{37q^6}{891813888} + \ldots$$

$$b_6(q) = 36 + \frac{q^2}{70} + \frac{187q^4}{43904000} - \frac{5861633q^6}{92935987200000} + \ldots$$

$$a_6(q) = 36 + \frac{q^2}{70} + \frac{187q^4}{43904000} + \frac{6743617q^6}{92935987200000} + \ldots$$

For $r \geq 7$, and $|q|$ not too large, $a_r$ is approximately equal to $b_r$, and the following approximation may be used

**20.2.26**

$$\left.\begin{aligned} a_r \\ b_r \end{aligned}\right\} = r^2 + \frac{q^2}{2(r^2-1)} + \frac{(5r^2+7)q^4}{32(r^2-1)^3(r^2-4)} + \frac{(9r^4+58r^2+29)q^6}{64(r^2-1)^5(r^2-4)(r^2-9)} + \ldots$$

The above expansion is not limited to integral values of $r$, and it is a very good approximation for $r$ of the form $n+\frac{1}{2}$ where $n$ is an integer. In case of integral values of $r=n$, the series holds only up to terms not involving $r^2-n^2$ in the denominator. Subsequent terms must be derived specially (as shown by Mathieu). Mulholland and Goldstein [20.38] have computed characteristic values for purely imaginary $q$ and found that $a_0$ and $a_2$ have a common real value for $|q|$ in the neighborhood of 1.468; Bouwkamp [20.5] has computed this number as $q_0=\pm i\ 1.46876852$ to 8 decimals. For values of $-iq>-iq_0$, $a_0$ and $a_2$ are conjugate complex numbers. From equation **20.2.25** it follows that the radius of convergence for the series defining $a_0$ is no greater than $|q_0|$. It is shown in [20.36], section **2.25** that the radius of convergence for $a_{2n}(q)$, $n\geq 2$ is greater than 3. Furthermore

$$a_r-b_r=O(q^r/r^{r-1}),\ r\rightarrow\infty.$$

**Power Series in $q$ for the Periodic Functions (for sufficiently small $|q|$)**

**20.2.27**

$$ce_0(z,q)=2^{-\frac{1}{2}}\left[1-\frac{q}{2}\cos 2z+q^2\left(\frac{\cos 4z}{32}-\frac{1}{16}\right)\right.$$

$$\left.-q^3\left(\frac{\cos 6z}{1152}-\frac{11\cos 2z}{128}\right)+\ldots\right]$$

$$ce_1(z,q)=\cos z-\frac{q}{8}\cos 3z$$

$$+q^2\left[\frac{\cos 5z}{192}-\frac{\cos 3z}{64}-\frac{\cos z}{128}\right]$$

$$-q^3\left[\frac{\cos 7z}{9216}-\frac{\cos 5z}{1152}-\frac{\cos 3z}{3072}+\frac{\cos z}{512}\right]+\ldots$$

$$se_1(z,q)=\sin z-\frac{q}{8}\sin 3z$$

$$+q^2\left[\frac{\sin 5z}{192}+\frac{\sin 3z}{64}-\frac{\sin z}{128}\right]$$

$$-q^3\left[\frac{\sin 7z}{9216}+\frac{\sin 5z}{1152}-\frac{\sin 3z}{3072}-\frac{\sin z}{512}\right]+\ldots$$

$$ce_2(z,q)=\cos 2z-q\left(\frac{\cos 4z}{12}-\frac{1}{4}\right)+q^2\left(\frac{\cos 6z}{384}-\frac{19\cos 2z}{288}\right)+\ldots$$

$$se_2(z,q)=\sin 2z-q\frac{\sin 4z}{12}+q^2\left(\frac{\sin 6z}{384}-\frac{\sin 2z}{288}\right)+\ldots$$

**20.2.28**

$$\begin{matrix}ce_r(z,q)\\ se_r(z,q)\end{matrix}=\cos\,(rz-p(\pi/2))-q\left\{\frac{\cos\left[(r+2)z-p\frac{\pi}{2}\right]}{4(r+1)}\right.$$

$$\left.-\frac{\cos\,[(r-2)z-p(\pi/2)]}{4(r-1)}\right\}$$

$$+q^2\left\{\frac{\cos\,[(r+4)z-p(\pi/2)]}{32(r+1)(r+2)}+\frac{\cos\,[(r-4)z-p(\pi/2)]}{32(r-1)(r-2)}\right.$$

$$\left.-\frac{\cos\,[rz-p(\pi/2)]}{32}\left[\frac{2(r^2+1)}{(r^2-1)^2}\right]\right\}+\ldots$$

with $p=0$ for $ce_r(z,q)$, $p=1$ for $se_r(z,q)$, $r\geq 3$.

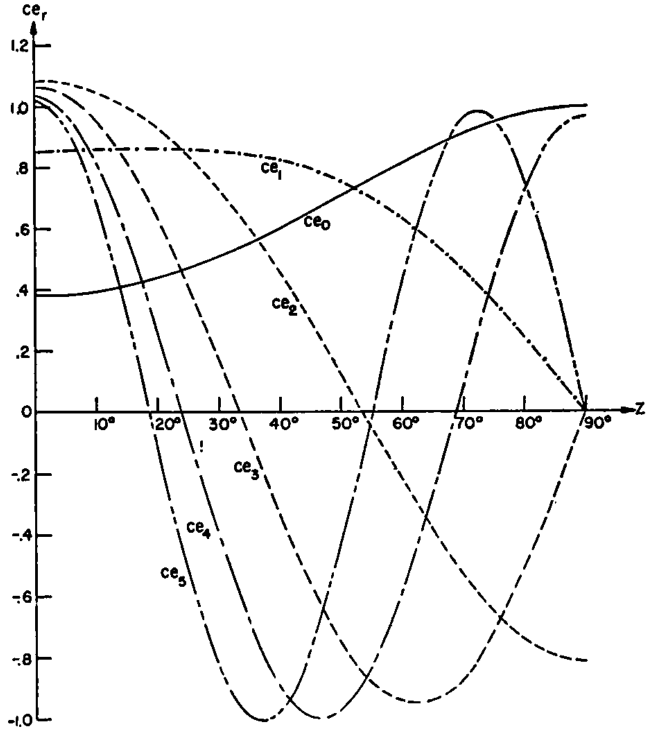

FIGURE 20.2. *Even Periodic Mathieu Functions, Orders 0–5* *$q=1$.*

For coefficients associated with above functions

**20.2.29**

$$A_0^0(0)=2^{-\frac{1}{2}};\ A_r^r(0)=B_r^r(0)=1,\ r>0$$

$$A_{2s}^0=[(-1)^s q^s/s!\,s!\,2^{2s-1}]\,A_0^0+\ \ldots,\ s>0$$

$$\begin{matrix}A_{r+2s}^r\\ B_{r+2s}^r\end{matrix}=[(-1)^s r!\ q^s/4^s(r+s)!\ s!]\ C_r^r+\ \ldots$$

$$rs>0,\ C_r^r=A_r^r \text{ or } B_r^r$$

$$A_{r-2s}^r \text{ or } B_{r-2s}^r=\frac{(r-s-1)!}{s!(r-1)!}\frac{q^s}{4^s}C_r^r+\ \ldots$$

**Asymptotic Expansion for Characteristic Values, $q\gg 1$**

Let $w=2r+1$, $q=w^4\varphi$, $\varphi$ real. Then

**20.2.30**

$$a_r\sim b_{r+1}\sim -2q+2w\sqrt{q}-\frac{w^2+1}{8}-\frac{\left(w+\frac{3}{w}\right)}{2^7\sqrt{\varphi}}$$

$$-\frac{d_1}{2^{12}\varphi}-\frac{d_2}{2^{17}\varphi^{3/2}}-\frac{d_3}{2^{20}\varphi^2}-\frac{d_4}{2^{25}\varphi^{5/2}}-\ \ldots$$

where

$$d_1=5+\frac{34}{w^2}+\frac{9}{w^4}$$

$$d_2=\frac{33}{w}+\frac{410}{w^3}+\frac{405}{w^5}$$

$$d_3=\frac{63}{w^2}+\frac{1260}{w^4}+\frac{2943}{w^6}+\frac{486}{w^8}$$

$$d_4=\frac{527}{w^3}+\frac{15617}{w^5}+\frac{69001}{w^7}+\frac{41607}{w^9}$$

**20.2.31** $b_{r+1}-a_r\sim 2^{4r+5}\sqrt{2/\pi}\,q^{\frac{1}{2}r+\frac{3}{4}}e^{-4\sqrt{q}}/r!, \qquad q\rightarrow\infty$

(given in [20.36] without proof.)

## 20.3. Floquet's Theorem and Its Consequences

Since the coefficients of Mathieu's equation

**20.3.1** $y''+(a-2q\cos 2z)y=0$

are periodic functions of $z$, it follows from the known theory relating to such equations that there exists a solution of the form

**20.3.2** $F_\nu(z)=e^{i\nu z}P(z),$

where $\nu$ depends on $a$ and $q$, and $P(z)$ is a periodic function, of the same period as that of the coefficients in **20.3.1,** namely $\pi$. (Floquet's theorem; see [20.16] or [20.22] for its more general form.) The constant $\nu$ is called the *characteristic exponent.* Similarly

**20.3.3** $F_\nu(-z)=e^{-i\nu z}P(-z)$

satisfies **20.3.1** whenever **20.3.2** does. Both $F_\nu(z)$ and $F_\nu(-z)$ have the property

**20.3.4**

$$y(z+k\pi)=C^ky(z),\ y=F_\nu(z) \text{ or } F_\nu(-z),$$
$$C=e^{i\nu\pi} \text{ for } F_\nu(z),\ C=e^{-i\nu\pi} \text{ for } F_\nu(-z)$$

Solutions having the property **20.3.4** will hereafter be termed *Floquet* solutions. Whenever $F_\nu(z)$ and $F_\nu(-z)$ are linearly independent, the general solution of **20.3.1** can be put into the form

**20.3.5** $y=AF_\nu(z)+BF_\nu(-z)$

If $AB\neq 0$, the above solution will *not be a Floquet solution.* It will be seen later, from the method for determining $\nu$ when $a$ and $q$ are given, that there is some ambiguity in the definition of $\nu$; namely, $\nu$ can be replaced by $\nu+2k$, where $k$ is an arbitrary integer. This is as it should be, since the addition of the factor exp $(2ikz)$ in **20.3.2** still leaves a periodic function of period $\pi$ for the coefficient of exp $i\nu z$.

It turns out that when $a$ belongs to the set of characteristic values $a_r$ and $b_r$ of **20.2,** then $\nu$ is zero or an integer. It is convenient to associate $\nu=r$ with $a_r(q)$, and $\nu=-r$ with $b_r(q)$; see [20.36]. In the special case when $\nu$ is an integer, $F_\nu(z)$ is proportional to $F_\nu(-z)$; the second, independent solution of **20.3.1** then has the form

**20.3.6** $y_2=zce_r(z,q)+\sum_{k=0}^{\infty} d_{2k+p}\sin(2k+p)z,$ associated with $ce_r(z,q)$

**20.3.7** $y_2=zse_r(z,q)+\sum_{k=0}^{\infty} f_{2k+p}\cos(2k+p)z,$ associated with $se_r(z,q)$

The coefficients $d_{2k+p}$ and $f_{2k+p}$ depend on the corresponding coefficients $A_m$ and $B_m$, respectively, of **20.2,** as well as on $a$ and $q$. See [20.30], section (7.50)–(7.51) and [20.58], section V, for details.

If $\nu$ is not an integer, then the Floquet solutions $F_\nu(z)$ and $F_\nu(-z)$ are linearly independent. It is clear that **20.3.2** can be written in the form

**20.3.8** $F_\nu(z)=\sum_{k=-\infty}^{\infty} c_{2k}e^{i(\nu+2k)z}.$

From **20.3.8** it follows that if $\nu$ is a proper fraction $m_1/m_2$, then every solution of **20.3.1** is periodic, and of period at most $2\pi m_2$. This agrees with results already noted in **20.2;** i.e., both independent solutions are periodic, if one is, provided the period is different from $\pi$ and $2\pi$.

### Method of Generating the Characteristic Exponent

Define two linearly independent solutions of **20.3.1,** for fixed $a$, $q$ by

**20.3.9**
$$y_1(0)=1;\ y_1'(0)=0.$$
$$y_2(0)=0;\ y_2'(0)=1.$$

Then it can be shown that

**20.3.10** $\cos\pi\nu-y_1(\pi)=0$

**20.3.11** $\cos\pi\nu-1-2y_1'\left(\frac{\pi}{2}\right)y_2\left(\frac{\pi}{2}\right)=0$

Thus $\nu$ may be obtained from a knowledge of $y_1(\pi)$ or from a knowledge of both $y_1'\left(\frac{\pi}{2}\right)$ and $y_2\left(\frac{\pi}{2}\right)$. For numerical purposes **20.3.11** may be more desirable because of the shorter range of integration, and hence the lesser accumulation of round-off errors. Either $\nu$, $-\nu$, or $\pm\nu+2k$ ($k$ an arbitrary integer) can be taken as the solution of **20.3.11.** Once $\nu$ has been fixed, the coefficients of **20.3.8** can be determined, except for an arbitrary multiplier which is independent of $z$.

The characteristic exponent can also be computed from a continued fraction, in a manner analogous to developments in **20.2,** if a sufficiently close first approximation to $\nu$ is available. For systematic tabulation, this method is considerably faster than the method of numerical integration. Thus, when **20.3.8** is substituted into **20.3.1,** there result the following recurrence relations:

**20.3.12** $$V_{2n}c_{2n}=c_{2n-2}+c_{2n+2}$$

where

**20.3.13** $$V_{2n}=[a-(2n+\nu)^2]/q, \quad -\infty<n<\infty.$$

When $\nu$ is complex, the coefficients $V_{2n}$ may also be complex. As in **20.2,** it is possible to generate the ratios

$$G_m=c_m/c_{m-2} \text{ and } H_{-m}=c_{-m-2}/c_{-m}$$

from the continued fractions

**20.3.14**

$$G_m=\frac{1}{V_m-}\,\frac{1}{V_{m+2}-\ldots}, \qquad m\geq 0$$

$$H_{-m}=\frac{1}{V_{-m-2}-}\,\frac{1}{V_{-m-4}-\ldots}, \qquad m\geq 0.$$

From the form of **20.3.13** and the known properties of continued fractions it is assured that for sufficiently large values of $|m|$ both $|G_m|$ and $|H_{-m}|$ converge. Once values of $G_m$ and $H_{-m}$ are available for some sufficiently large value of $m$, then the finite number of ratios $G_{m-2}, G_{m-4}, \ldots, G_0$ can be computed in turn, if they exist. Similarly for $H_{-m+2}, \ldots, H_0$. It is easy to show that $\nu$ is the correct characteristic exponent, appropriate for the point $(a, q)$, if and only if $H_0G_0=1$. An iteration technique can be used to improve the value of $\nu$, by the method suggested in [20.3]. One coefficient $c_j$ can be assigned arbitrarily; the rest are then completely determined. After all the $c_j$ become available, a multiplier (depending on $q$ but not on $z$) can be found to satisfy a prescribed normalization.

It is well known that continued fractions can be converted to determinantal form. Equation **20.3.14** can in fact be written as a determinant with an infinite number of rows—a special case of Hill's determinant. See [20.19], [20.36], [20.15], or [20.30] for details. Although the determinant has actually been used in computations where high-speed computers were available, the direct use of the continued fraction seems much less laborious.

### Special Cases ($a$, $q$ Real)

Corresponding to $q=0$, $y_1=\cos\sqrt{a}z$, $y_2=\sin\sqrt{a}z$; the Floquet solutions are $\exp(iaz)$ and $\exp(-iaz)$. As $a$, $q$ vary continuously in the $q-a$ plane, $\nu$ describes curves; $\nu$ is real when $(q, a)$, $q\geq 0$ lies in the region between $a_r(q)$ and $b_{r+1}(q)$ and

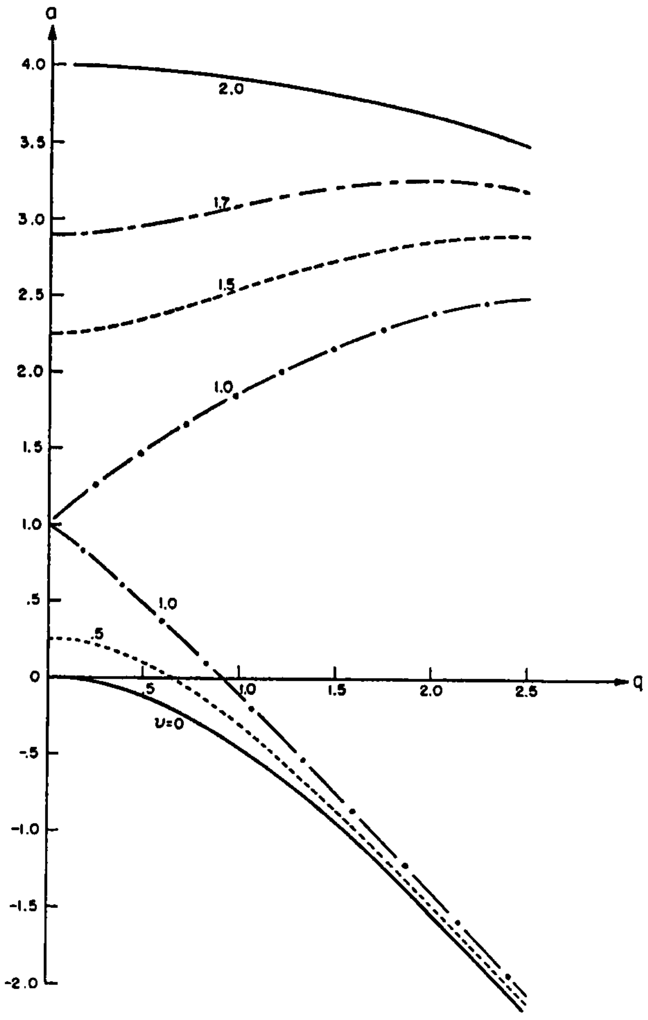

FIGURE 20.6. *Characteristic Exponent-First Two Stable Regions $y=e^{i\nu x}P(x)$ where $P(x)$ is a periodic function of period $\pi$.*

all solutions of **20.1.1** for real $z$ are therefore bounded (stable); $\nu$ is complex in regions between $b_r$ and $a_r$; in these regions every solution becomes infinite at least once; hence these regions are termed "unstable regions". The characteristic curves $a_r$, $b_r$ separate the regions of stability. For negative $q$, the stable regions are between $b_{2r+1}$ and $b_{2r+2}$, $a_{2r}$ and $a_{2r+1}$; the unstable regions are between $a_{2r+1}$ and $b_{2r+1}$, $a_{2r}$ and $b_{2r}$.

In some problems solutions are required for real values of $z$ only. In such cases a knowledge of the characteristic exponent $\nu$ and the periodic function $P(z)$ is sufficient for the evaluation of the required functions. For complex values of $z$, however, the series defining $P(z)$ converges slowly. Other solutions will be determined in the next section; they all have the remarkable property that they depend on the same coefficients $c_m$ developed in connection with Floquet's theorem (except for an arbitrary normalization factor).

### Expansions for Small $q$ ([20.36] chapter 2)

If $\nu$, $q$ are fixed:

**20.3.15**

$$a=\nu^2+\frac{q^2}{2(\nu^2-1)}+\frac{(5\nu^2+7)q^4}{32(\nu^2-1)^3(\nu^2-4)}$$

$$+\frac{(9\nu^4+58\nu^2+29)q^6}{64(\nu^2-1)^5(\nu^2-4)(\nu^2-9)}+\ldots \quad (\nu\neq 1,2,3).$$

For the coefficients $c_{2j}$ of **20.3.8**

**20.3.16**

$$c_2/c_0=\frac{-q}{4(\nu+1)}-\frac{(\nu^2+4\nu+7)q^3}{128(\nu+1)^3(\nu+2)(\nu-1)}+\ldots$$

$$(\nu\neq 1,2)$$

$$c_4/c_0=q^2/32(\nu+1)(\nu+2)+\ldots$$

$$c_{2s}/c_0=(-1)^s q^s\Gamma(\nu+1)/2^{2s}s!\Gamma(\nu+s+1)+\ldots$$

**20.3.17**

$$F_\nu(z)=c_0\left[e^{i\nu z}-q\left\{\frac{e^{i(\nu+2)z}}{4(\nu+1)}-\frac{e^{i(\nu-2)z}}{4(\nu-1)}\right\}\right]+\ldots$$

$$(\nu \text{ not an integer})$$

For small values of $a$

**20.3.18**

$$\cos\nu\pi=\left(1-\frac{a\pi^2}{2}+\frac{a^2\pi^4}{24}+\ldots\right)$$

$$-\frac{q^2\pi^2}{4}\left[1+a\left(1-\frac{\pi^2}{6}\right)+\ldots\right]$$

$$+q^4\left(\frac{\pi^4}{96}-\frac{25\pi^2}{256}+\ldots\right)+\ldots$$

## 20.4. Other Solutions of Mathieu's Equation

Following Erdélyi [20.14], [20.15], define

**20.4.1** $\varphi_k(z)=[e^{i\pi}\cos(z-b)/\cos(z+b)]^{\frac{1}{2}k}J_k(f)$

where

**20.4.2** $f=2[q\cos(z-b)\cos(z+b)]^{\frac{1}{2}}$,

and $J_k(f)$ is the Bessel function of order $k$; $b$ is a fixed, arbitrary complex number. By using the recurrence relations for Bessel functions the following may be verified:

**20.4.3**

$$\frac{d^2\varphi_k}{dz^2}-2q(\cos 2z)\varphi_k+q(\varphi_{k-2}+\varphi_{k+2})+k^2\varphi_k=0.$$

It follows that a formal solution of **20.1.1** is given by

**20.4.4** $$y=\sum_{n=-\infty}^{\infty}c_{2n}\varphi_{2n+\nu}$$

where the coefficients $c_{2n}$ are those associated with Floquet's solution. In the above, $\nu$ may be complex. Except for the special case when $\nu$ is an integer, the following holds:

$$\frac{\varphi_{2n+\nu-2}}{\varphi_{2n+\nu}} \sim \frac{\varphi_{-2n+\nu}}{\varphi_{-2n+\nu+2}} \sim \frac{-4n^2}{q[\cos(z-b)]^2} \qquad (n \rightarrow \infty)$$

If $\nu$ and $n$ are integers, $J_{-2n+\nu}(f)=(-1)^\nu J_{2n-\nu}(f)$.

$$[\varphi_{2n+\nu}/\varphi_{2n+\nu-2}] \sim -[\cos(z-b)]^2 q/4n^2$$

$$[\varphi_{-2n+\nu}/\varphi_{-2n+\nu+2}] \sim -4n^2/q[\cos(z-b)]^2$$

On the other hand

$$\frac{c_{2n}}{c_{2n-2}} \sim \frac{c_{-2n}}{c_{-2n+2}} \sim \frac{-q}{4n^2} \qquad (n \rightarrow \infty)$$

It follows that **20.4.4** converges absolutely and uniformly in every closed region where

$|\cos(z-b)| > d_1 > 1$.

There are two such disjoint regions:

(I) $\mathscr{I}(z-b) > d_2 > 0$; $(|\cos(z-b)| > d_1 > 1)$

(II) $\mathscr{I}(z-b) < -d_2 < 0$; $(|\cos(z-b)| > d_1 > 1)$

If $\nu$ is an integer **20.4.4** converges for all values of $z$. Various representations are found by specializing $b$.

**20.4.5**

$$\text{If } b=0,\ y=e^{i\pi\nu/2} \sum_{n=-\infty}^{\infty} c_{2n}(-1)^n J_{2n+\nu}(2\sqrt{q}\cos z)$$

$$(|\cos z| > 1,\ |\arg 2\sqrt{q}\cos z| \leq \pi)$$

**20.4.6**

$$\text{If } b=\frac{\pi}{2},\ y=\sum_{n=-\infty}^{\infty} c_{2n} J_{2n+\nu}(2i\sqrt{q}\sin z)$$

$$(|\sin z| > 1,\ |\arg 2\sqrt{q}\sin z| \leq \pi)$$

If $b \rightarrow \infty i$, $y$ reduces to a multiple of the solution **20.3.8.** The fact that **20.3.8, 20.4.5,** and **20.4.6** are special cases of **20.4.4** explains why it is that these apparently dissimilar expansions involve the same set of coefficients $c_{2n}$.

Since **20.4.4** results from the recurrence properties of Bessel functions, $J_k(f)$ can be replaced by $H_k^{(j)}(f)$, $j=1, 2$, where $H_k^{(j)}$ is the Hankel function, at least formally. Thus let

$$\psi_k^j = [e^{i\pi}\cos(z-b)/\cos(z+b)]^{\frac{1}{2}k} H_k^{(j)}(f)$$

where $f$ satisfies **20.4.2.** An examination of the ratios $\psi_{2n+\nu}/\psi_{2n+\nu-2}$ shows that

$$y=\sum_{n=-\infty}^{\infty} c_{2n}\psi_{2n+\nu}^{(j)}$$

will be a solution provided

$$|\cos(z-b)| > 1;\ |\cos(z+b)| > 1.$$

The above two conditions are necessary even when $\nu$ is an integer. Once $b$ is fixed, the regions in which the solutions converge can be readily established.

Following [20.36] let

**20.4.7**

$$J_p(x)=Z_p^{(1)}(x);\quad Y_p(x)=Z_p^{(2)}(x);$$
$$H_p^{(1)}(x)=Z_p^{(3)}(x);\quad H_p^{(2)}(x)=Z_p^{(4)}(x)$$

If $z$ is replaced by $-iz$ in **20.4.5** and **20.4.6** solutions of **20.1.2** are obtained. Thus

**20.4.8**

$$y_1^{(j)}(z)=\sum_{n=-\infty}^{\infty} c_{2n}(-1)^n Z_{2n+\nu}^{(j)}(2\sqrt{q}\cosh z)$$

$$(|\cosh z| > 1)$$

**20.4.9**

$$y_2^{(j)}(z)=\sum_{n=-\infty}^{\infty} c_{2n} Z_{2n+\nu}^{(j)}(2\sqrt{q}\sinh z)$$

$$(|\sinh z| > 1,\ j=1, 2, 3, 4)$$

The relation between $y_1^{(j)}(z)$ and $y_2^{(j)}(z)$ can be determined from the asymptotic properties of the Bessel functions for large values of argument. It can be shown that

**20.4.10**

$$y_1^{(j)}(z)/y_2^{(j)}(z)=[F_\nu(0)/F_\nu\left(\frac{\pi}{2}\right)]e^{i\nu\pi/2} \qquad (\mathscr{R}z > 0):$$

When $\nu$ is not an integer, the above solutions do not vanish identically. See **20.6** for integral values of $\nu$.

### Solutions Involving Products of Bessel Functions

**20.4.11**

$$y_3^{(j)}(z)=\frac{1}{c_{2s}}\sum_{n=-\infty}^{\infty} c_{2n}(-1)^n Z_{n+\nu+s}^{(j)}(\sqrt{q}e^{iz}) J_{n-s}(\sqrt{q}e^{-iz})$$

$$(j=1, 2, 3, 4)$$

satisfies **20.1.1,** where $Z_n^{(j)}(u)$ is defined in **20.4.7,** the coefficients $c_{2n}$ belong to the Floquet solution, and $s$ is an arbitrary integer, $c_{2s} \neq 0$. The solution converges over the entire complex $z$-plane if $q \neq 0$. Written with $z$ replaced by $-iz$, one obtains solutions of **20.1.2.**

**20.4.12**

$$M_\nu^j(z, q)=\frac{1}{c_{2s}^\nu}\sum_{n=-\infty}^{\infty} c_{2n}^\nu(-1)^n Z_{n+\nu+s}^{(j)}(\sqrt{q}e^z) J_{n-s}(\sqrt{q}e^{-z})$$

It can be verified from **20.4.8** and **20.4.12** that

**20.4.13** $$\frac{y_1^{(j)}(z)}{M_j^j(z, q)}=F_\nu(0), \qquad (\mathscr{R}z>0)$$

provided $c_{2s}\neq 0$. If $c_{2s}=0$, the coefficient of $1/c_{2s}$ in **20.4.11** vanishes identically. For details see [20.43], [20.15], [20.36].

If $s$ is chosen so that $|c_{2s}|$ is the largest coefficient of the set $|c_{2j}|$, then rapid convergence of **20.4.12** is obtained, when $\mathscr{R}z>0$. Even then one must be on guard against the possible loss of significant figures in the process of summing the series, especially so when $q$ is large, and $|z|$ small. (If $j\neq 1$, then the phase of the logarithmic terms occurring in **20.4.12** must be defined, to make the functions single-valued.)

## 20.5. Properties of Orthogonality and Normalization

If $a(\nu+2p, q)$, $a(\nu+2s, q)$ are simple roots of **20.3.10** then

**20.5.1** $$\int_0^\pi F_{\nu+2p}(z)F_{\nu+2s}(-z)dz=0, \text{ if } p\neq s.$$

Define

**20.5.2** $$ce_\nu(z, q)=\frac{1}{2}[F_\nu(z)+F_\nu(-z)];$$

$$se_\nu(z, q)=-i\frac{1}{2}[F_\nu(z)-F_\nu(-z)]$$

$ce_\nu(z, q)$, $se_\nu(z, q)$ are thus even and odd functions of $z$, respectively, for all $\nu$ (when not identically zero).

If $\nu$ is an integer, then $ce_\nu(z, q)$, $se_\nu(z, q)$ are either Floquet solutions or identically zero. The solutions $ce_r(z, q)$ are associated with $a_r$; $se_r(z, q)$ are associated with $b_r$; $r$ an integer.

### Normalization for Integral Values of $\nu$ and Real $q$

**20.5.3** $$\int_0^{2\pi}[ce_r(z, q)]^2dz=\int_0^{2\pi}[se_r(z, q)]^2dz=\pi$$

For integral values of $\nu$ the summation in **20.3.8** reduces to the simpler forms **20.2.3–20.2.4;** on account of **20.5.3,** the coefficients $A_m$ and $B_m$ (for all orders $r$) have the property

**20.5.4**

$$2A_0^2+A_2^2+\ldots=A_1^2+A_3^2+\ldots$$
$$=B_1^2+B_3^2+\ldots=B_2^2+B_4^2+\ldots=1.$$

**20.5.5**

$$A_0^{2s}=\frac{1}{2\pi}\int_0^{2\pi}ce_{2s}(z, q)dz;\ A_n^r=\frac{1}{\pi}\int_0^{2\pi} ce_r(z, q)\cos nzdz$$

$$B_n^r=\frac{1}{\pi}\int_0^{2\pi} se_r(z, q)\sin nzdz \qquad n\neq 0$$

For integral values of $\nu$, the functions $ce_r(z, q)$ and $se_r(z, q)$ form a complete orthogonal set for the interval $0\leq z\leq 2\pi$. Each of the four systems $ce_{2r}(z)$, $ce_{2r+1}(z)$, $se_{2r}(z)$, $se_{2r+1}(z)$ is complete in the smaller interval $0\leq z\leq\frac{1}{2}\pi$, and each of the systems $ce_r(z)$, $se_r(z)$ is complete in $0\leq z\leq\pi$.

If $q$ is not real, there exist multiple roots of **20.3.10;** for such special values of $a(q)$, the integrals in **20.5.3** vanish, and the normalization is therefore impossible. In applications, the particular normalization adopted is of little importance, except possibly for obtaining quantitative relations between solutions of various types. For this reason the normalization of $F_\nu(z)$, for arbitrary complex values of $a$, $q$, will not be specified here. It is worth noting, however, that solutions

$$\alpha ce_r(z, q), \qquad \beta se_r(z, q)$$

defined so that

$$\alpha ce_r(0, q)=1; \qquad \left[\frac{d}{dz}\beta se_r(z, q)\right]_{z=0}=1$$

are always possible. This normalization has in fact been used in [20.59], and also in [20.58], where the most extensive tabular material is available. The tabulated entries in [20.58] supply the conversion factors $A=1/\alpha$, $B=1/\beta$, along with the coefficients. Thus conversion from one normalization to another is rather easy.

In a similar vein, no general normalization will be imposed on the functions defined in **20.4.8.**

## 20.6. Solutions of Mathieu's Modified Equation 20.1.2 for Integral $\nu$ (Radial Solutions)

Solutions of the first kind

**20.6.1**

$$Ce_{2r+p}(z, q)=ce_{2r+p}(iz,q)$$

$$=\sum_{k=0}^{\infty} A_{2k+p}^{2r+p}(q)\cosh(2k+p)z$$

associated with $a_r$

**20.6.2** $$Se_{2r+p}(z,q)=-ise_{2r+p}(iz,q)=\sum_{k=0}^{\infty}B_{2k+p}^{2r+p}(q)\sinh{(2k+p)z},\text{ associated with }b_r$$

writing $A_{2k+p}^{2r+p}(q)=A_{2k+p}$ for brevity; similarly for $B_{2k+p}$; $p=0, 1$,

**20.6.3** $$Ce_{2r}(z,q)=\frac{ce_{2r}\left(\frac{\pi}{2},q\right)}{A_0^{2r}}\sum_{k=0}^{\infty}(-1)^kA_{2k}J_{2k}(2\sqrt{q}\cosh z)=\frac{ce_{2r}(0,q)}{A_0^{2r}}\sum_{k=0}^{\infty}A_{2k}J_{2k}(2\sqrt{q}\sinh z)$$

**20.6.4** $$Ce_{2r+1}(z,q)=\frac{ce'_{2r+1}\left(\frac{\pi}{2},q\right)}{\sqrt{q}A_1^{2r+1}}\sum_{k=0}^{\infty}(-1)^{k+1}A_{2k+1}J_{2k+1}(2\sqrt{q}\cosh z)$$

$$=\frac{ce_{2r+1}(0,q)}{\sqrt{q}A_1^{2r+1}}\coth z\sum_{k=0}^{\infty}(2k+1)A_{2k+1}J_{2k+1}(2\sqrt{q}\sinh z)$$

**20.6.5** $$Se_{2r}(z,q)=\frac{se'_{2r}\left(\frac{\pi}{2},q\right)\tanh z}{qB_2^{2r}}\sum_{k=1}^{\infty}(-1)^k2kB_{2k}J_{2k}(2\sqrt{q}\cosh z)$$

$$=\frac{se'_{2r}(0,q)}{qB_2^{2r}}\coth z\sum_{k=1}^{\infty}2kB_{2k}J_{2k}(2\sqrt{q}\sinh z)$$

**20.6.6** $$Se_{2r+1}(z,q)=\frac{se_{2r+1}\left(\frac{\pi}{2},q\right)}{\sqrt{q}B_1^{2r+1}}\tanh z\sum_{k=0}^{\infty}(-1)^k(2k+1)B_{2k+1}J_{2k+1}(2\sqrt{q}\cosh z)$$

$$=\frac{se'_{2r+1}(0,q)}{\sqrt{q}B_1^{2r+1}}\sum_{k=0}^{\infty}B_{2k+1}J_{2k+1}(2\sqrt{q}\sinh z)$$

See [20.30] for still other forms.

Solutions of the second kind, as well as solutions of the third and fourth kind (analogous to Hankel functions) are obtainable from **20.4.12.**

**20.6.7** $$Mc_{2r}^{(j)}(z,q)=\sum_{k=0}^{\infty}(-1)^{r+k}A_{2k}^{2r}(q)[J_{k-s}(u_1)Z_{k+s}^{(j)}(u_2)+J_{k+s}(u_1)Z_{k-s}^{(j)}(u_2)]/\epsilon_sA_{2s}^{2r}$$

where $\epsilon_0=2$, $\epsilon_s=1$, for $s=1, 2, \ldots$; $s$ arbitrary, associated with $a_{2r}$

**20.6.8** $$Mc_{2r+1}^{(j)}(z,q)=\sum_{k=0}^{\infty}(-1)^{r+k}A_{2k+1}^{2r+1}(q)[J_{k-s}(u_1)Z_{k+s+1}^{(j)}(u_2)+J_{k+s+1}(u_1)Z_{k-s}^{(j)}(u_2)]/A_{2s+1}^{2r+1}$$

associated with $a_{2r+1}$

**20.6.9** $$Ms_{2r}^{(j)}(z,q)=\sum_{k=1}^{\infty}(-1)^{k+r}B_{2k}^{2r}(q)[J_{k-s}(u_1)Z_{k+s}^{(j)}(u_2)-J_{k+s}(u_1)Z_{k-s}^{(j)}(u_2)]/B_{2s}^{2r},\text{ associated with }b_{2r}$$

**20.6.10** $$Ms_{2r+1}^{(j)}(z,q)=\sum_{k=0}^{\infty}(-1)^{k+r}B_{2k+1}^{2r+1}(q)[J_{k-s}(u_1)Z_{k+s+1}^{(j)}(u_2)-J_{k+s+1}(u_1)Z_{k-s}^{(j)}(u_2)]/B_{2s+1}^{2r+1}$$

associated with $b_{2r+1}$

where

$$u_1=\sqrt{q}e^{-z},\ u_2=\sqrt{q}e^{z},\ B_{2s+p}^{2r+p},\ A_{2s+p}^{2r+p}\neq0,\ p=0,1.$$

See **20.4.7** for definition of $Z_m^{(j)}(x)$.

Solutions **20.6.7–20.6.10** converge for all values of $z$, when $q\neq0$. If $j=2, 3, 4$ the logarithmic terms entering into the Bessel functions $Y_m(u_2)$ must be defined, to make the functions single-valued. This can be accomplished as follows:

Define (as in [20.58])

**20.6.11** $$\ln{(\sqrt{q}e^z)}=\ln{(\sqrt{q})}+z$$

See [20.15] and [20.36], section **2.75** for derivation.

### Other Expressions for the Radial Functions (Valid Over More Limited Regions)

**20.6.12**
$$Mc_{2r}^{(j)}(z,q)=[ce_{2r}(0,q)]^{-1}\sum_{k=0}^{\infty}(-1)^{k+r}A_{2k}^{2r}(q)Z_{2k}^{(j)}(2\sqrt{q}\cosh z)$$

$$Mc_{2r+1}^{(j)}(z,q)=[ce_{2r+1}(0,q)]^{-1}\sum_{k=0}^{\infty}(-1)^{k+r}A_{2k+1}^{2r+1}(q)Z_{2k+1}^{(j)}(2\sqrt{q}\cosh z)$$

**20.6.13**
$$Ms_{2r}^{(j)}(z,q)=[se'_{2r}(0,q)]^{-1}\tanh z\sum_{k=1}^{\infty}(-1)^{k+r}2kB_{2k}^{2r}(q)Z_{2k}^{(j)}(2\sqrt{q}\cosh z)$$

$$Ms_{2r+1}^{(j)}(z,q)=[se'_{2r+1}(0,q)]^{-1}\tanh z\sum_{k=0}^{\infty}(-1)^{k+r}(2k+1)B_{2k+1}^{2r+1}(q)Z_{2k+1}^{(j)}(2\sqrt{q}\cosh z)$$

Valid for $\mathscr{R}z>0$, $|\cosh z|>1$; if $j=1$, valid for all $z$. They agree with **20.6.7–20.6.10** if the Bessel functions $Y_m(2q^{\frac{1}{2}}\cosh z)$ are made single-valued in a suitable way. For example, let

$$Y_m(u)=\frac{2}{\pi}(\ln u)J_m(u)+\phi(u)$$

where $\phi(u)$ is single-valued for all finite values of $u$. With $u=2q^{\frac{1}{2}}\cosh z$, define

**20.6.14**
$$\ln(2q^{\frac{1}{2}}\cosh z)=\ln 2q^{\frac{1}{2}}+z+\ln\tfrac{1}{2}(1+e^{-2z})\qquad -\frac{\pi}{2}\leq\arg\tfrac{1}{2}(1+e^{-2z})\leq\frac{\pi}{2}.$$

(If $q$ is not positive, the phase of $\ln 2q^{\frac{1}{2}}$ must also be specified, although this specification will not affect continuity with respect to $z$. If $Y_m(u)$ is defined from some other expression, the definition must be compatible with **20.6.14**.)

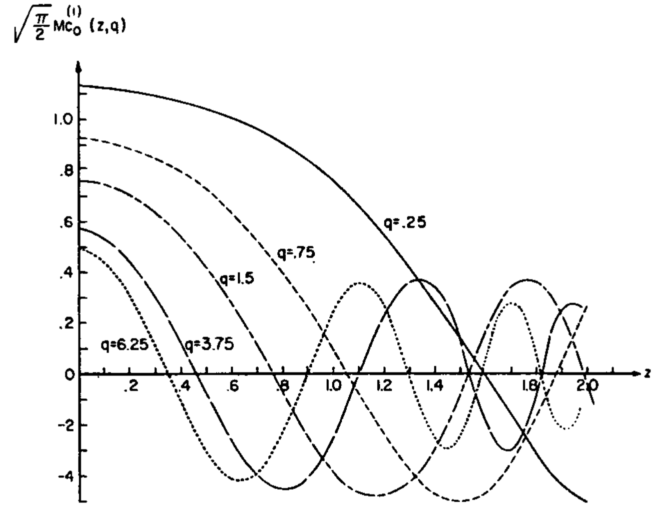

FIGURE 20.11. *Radial Mathieu Function of the First Kind.*

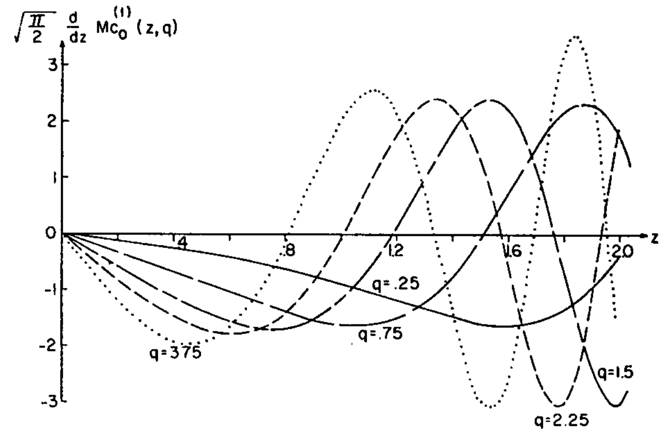

FIGURE 20.12. *Derivative of the Radial Mathieu Function of the First Kind.*

(From J. C. Wiltse and M. J. King, Derivatives, zeros, and other data pertaining to Mathieu functions, The Johns Hopkins Univ. Radiation Laboratory Tech. Rept. AF-57, 1958, with permission)

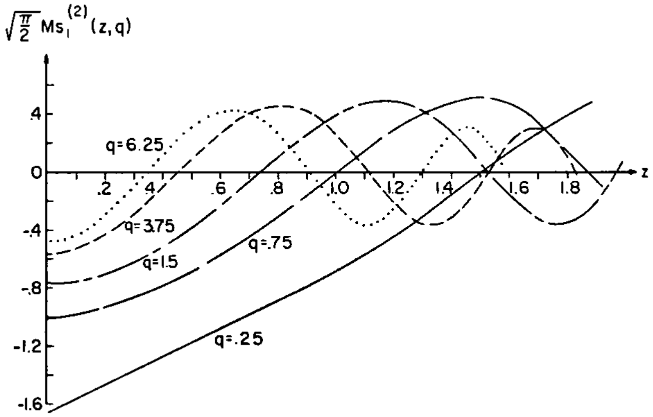

FIGURE 20.13. *Radial Mathieu Function of the Second Kind.*

(From J. C. Wiltse and M. J. King, Values of the Mathieu functions, The Johns Hopkins Univ. Radiation Laboratory Tech. Rept. AF-53, 1958, with permission)

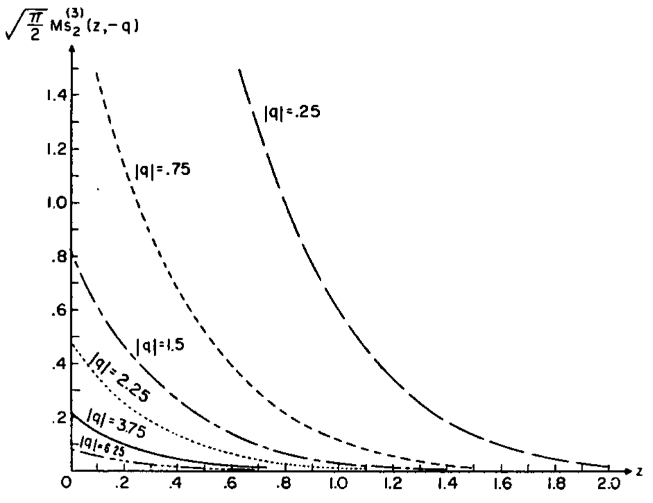

FIGURE 20.14. *Radial Mathieu Function of the Third Kind.*

(From J. C. Wiltse and M. J. King, Values of the Mathieu functions, The Johns Hopkins Univ. Radiation Laboratory Tech. Rept. AF-53, 1958, with permission)

If $j=1$, $Mc^{(1)}_{2r+p}$ and $Ms^{(1)}_{2r+p}$, $p=0, 1$ are solutions of the first kind, proportional to $Ce_{2r+p}$ and $Se_{2r+p}$, respectively.

Thus

**20.6.15**

$$Ce_{2r}(z, q)=\frac{ce_{2r}\left(\frac{\pi}{2}, q\right) ce_{2r}(0, q)}{(-1)^r A_0^{2r}} Mc_{2r}^{(1)}(z, q)$$

$$Ce_{2r+1}(z, q)=\frac{ce'_{2r+1}\left(\frac{\pi}{2}, q\right) ce_{2r+1}(0, q)}{(-1)^{r+1}\sqrt{q}A_1^{2r+1}} Mc_{2r+1}^{(1)}(z, q)$$

$$Se_{2r}(z, q)=\frac{se'_{2r}(0, q) se'_{2r}\left(\frac{\pi}{2}, q\right)}{(-1)^r q B_2^{2r}} Ms_{2r}^{(1)}(z, q)$$

$$Se_{2r+1}(z, q)=\frac{se'_{2r+1}(0, q) se_{2r+1}\left(\frac{\pi}{2}, q\right)}{(-1)^r\sqrt{q}B_1^{2r+1}} Ms_{2r+1}^{(1)}(z, q)$$

The Mathieu-Hankel functions are

**20.6.16**

$$M_r^{(3)}(z, q)=M_r^{(1)}(z, q)+iM_r^{(2)}(z, q)$$

$$M_r^{(4)}(z, q)=M_r^{(1)}(z, q)-iM_r^{(2)}(z, q)$$

$$M_r^{(j)}=Mc_r^{(j)} \text{ or } Ms_r^{(j)}.$$

From **20.6.7–20.6.11** and the known properties of Bessel functions one obtains

**20.6.17**

$$M_{2r+p}^{(2)}(z+in\pi, q)$$
$$=(-1)^{np}[M_{2r+p}^{(2)}(z, q)+2niM_{2r+p}^{(1)}(z, q)]$$

$$M_{2r+p}^{(3)}(z+in\pi, q)$$
$$=(-1)^{np}[M_{2r+p}^{(3)}(z, q)-2nM_{2r+p}^{(1)}(z, q)]$$

$$M_{2r+p}^{(4)}(z+in\pi, q)$$
$$=(-1)^{np}[M_{2r+p}^{(4)}(z, q)+2nM_{2r+p}^{(1)}(z, q)]$$

where $M=Mc$ or $Ms$ throughout any of the above equations.

### Other Properties of Characteristic Functions, $q$ Real (Associated With $a_r$ and $b_r$)

Consider

**20.6.18**

$$X_1=Mc_r^{(2)}(z, q)+Mc_r^{(2)}(-z, q);$$
$$X_2=Ms_r^{(2)}(z, q)-Ms_r^{(2)}(-z, q)$$

Since $X_1$ is an even solution it must be proportional to $Mc_r^{(1)}(z, q)$; for **20.1.2** admits of only one even solution (aside from an arbitrary constant factor). Similarly, $X_2$ is proportional to $Ms_r^{(1)}(z, q)$. The proportionality factors can be found by considering values of the functions at $z=0$. Define, therefore,

**20.6.19**

$$Mc_r^{(2)}(-z, q)=-Mc_r^{(2)}(z, q)-2f_{e,r}Mc_r^{(1)}(z, q)$$

**20.6.20**

$$Ms_r^{(2)}(-z, q)=Ms_r^{(2)}(z, q)-2f_{o,r}Ms_r^{(1)}(z, a)$$

where

**20.6.21**

$$f_{e,r}=-Mc_r^{(2)}(0, q)/Mc_r^{(1)}(0, q)$$

$$f_{o,r}=\left[\frac{d}{dz} Ms_r^{(2)}(z, q)/\frac{d}{dz} Ms_r^{(1)}(z, q)\right]_{z=0}$$

See [20.58].

In particular the above equations can be used to extend solutions of **20.6.12–20.6.13** when $\mathscr{R}z<0$. For although the latter converge for $\mathscr{R}z<0$, provided only $|\cosh z|>1$, they do not represent the same functions as **20.6.9–20.6.10.**

## 20.7. Representations by Integrals and Some Integral Equations

Let

**20.7.1** $$G(u)=\oint_C K(u, t)V(t)dt$$

be defined for $u$ in a domain $U$ and let the contour $C$ belong to the region $T$ of the complex $t$-plane, with $t=\gamma_0$ as the starting point of the contour and $t=\gamma_1$ as its end-point. The kernel $K(u, t)$ and the function $V(t)$ satisfy **20.7.3** and the hypotheses in **20.7.2.**

**20.7.2** $K(u, t)$ and its first two partial derivatives with respect to $u$ and $t$ are continuous for $t$ on $C$ and $u$ in $U$; $V$ and $\frac{dV}{dt}$ are continuous in $t$.

**20.7.3**

$$\left[\frac{\partial K}{\partial t} V-\frac{dV}{dt} K\right]_{\gamma_0}^{\gamma_1}=0; \frac{d^2V}{dt^2}+(a-2q \cos 2t)V=0.$$

If $K$ satisfies

**20.7.4** $$\frac{\partial^2 K}{\partial u^2}+\frac{\partial^2 K}{\partial t^2}+2q(\cosh 2u-\cos 2t)K=0$$

then $G(u)$ is a solution of Mathieu's modified equation **20.1.2.**

If $K(u, t)$ satisfies

**20.7.5** $$\frac{\partial^2 K}{\partial u^2}+\frac{\partial^2 K}{\partial t^2}+2q(\cos 2u-\cos 2t)K=0$$

then $G(u)$ is a solution of Mathieu's equation **20.1.1,** with $u$ replacing $v$.

### Kernels $K_1(z, t)$ and $K_2(z, t)$

**20.7.6** $K_1(z, t)=Z_\nu^{(j)}(u)[M(z, t)]^{-\nu/2}, \qquad (\mathscr{R}z>0)$

where

**20.7.7** $u=\sqrt{2q(\cosh 2z+\cos 2t)}$

**20.7.8** $M(z, t)=\cosh (z+it)/\cosh (z-it)$

To make $M^{-\frac{1}{2}\nu}$ single-valued, define

**20.7.9**

$$\begin{aligned}&\cosh (z+i\pi)=e^{i\pi}\cosh z\\&\cosh (z-i\pi)=e^{-i\pi}\cosh z\\&M(z, 0)=1\\&[M(z, \pi)]^{-\frac{1}{2}\nu}=e^{-i\nu\pi}M(z, 0)\end{aligned}$$

Let

**20.7.10** $G(z, q)=\frac{1}{\pi}\int_0^\pi K_1(u, t)F_\nu(t)dt, \qquad (\mathscr{R}z>0)$

where $F_\nu(t)$ is defined in **20.3.8.** It may be verified that $K_1F_\nu$ satisfies **20.7.3,** $K$ satisfies **20.7.2** and **20.7.4.** Hence $G$ is a solution of **20.1.2** (with $z$ replacing $u$). It can be shown that $K_1$ may be replaced by the more general function

**20.7.11**

$$K_2(z, t)=Z^{(j)}_{\nu+2s}(u)[M(z, t)]^{-\frac{1}{2}\nu+s}, \ s \text{ any integer.}$$

See **20.4.7** for definition of $Z^{(j)}_{\nu+2s}(u)$.

From the known expansions for $Z^{(j)}_{\nu+2s}(u)$ when $\mathscr{R}z$ is large and positive it may be verified that

**20.7.12**

$$M_\nu^{(j)}(z, q)=$$

$$\frac{(-1)^s}{\pi c_{2s}}\int_0^\pi Z^{(j)}_{\nu+2s}(u)\left[\frac{\cosh z+it}{\cosh z-it}\right]^{-\frac{1}{2}\nu-s}F_\nu(t)dt$$

$$(\mathscr{R}z>0, \mathscr{R}(\nu+\tfrac{1}{2})>0)$$

where $M_\nu^{(j)}(z, q)$ is given by **20.4.12,** $s=0, 1, \ldots$, $c_{2s}\neq 0$, and $F_\nu(t)$ is the Floquet solution, **20.3.8.**

### Kernel $K_3(z, t, a)$

**20.7.13** $K_3(z, t, a)=e^{2i\sqrt{q}\,w}$

where

**20.7.14** $w=\cosh z\cos a\cos t+\sinh z\sin a\sin t$

**20.7.15** $G(z, q, a)=\frac{1}{\pi}\oint_C e^{2i\sqrt{q}\,w}F_\nu(t)dt$

where $F_\nu(t)$ is the Floquet solution **20.3.8.** The path $C$ is chosen so that $G(z, t, a)$ exists, and **20.7.2, 20.7.3** are satisfied. Then it may be verified that $K_3(z, t, a)$, considered as a function of $z$ and $t$, satisfies **20.7.4;** also, considered as a function of $a$ and $t$, $K_3$ satisfies **20.7.5.** Consequently $G(z, q, a)=Y(z, q)y(a, q)$, where $Y$ and $y$ satisfy **20.1.2** and **20.1.1,** respectively.

*Choice of Path C.* Three paths will be defined:

**20.7.16**

Path $C_3$: from $-d_1+i\infty$ to $d_2-i\infty$, $d_1$, $d_2$ real

$$-d_1<\arg [\sqrt{q}\{\cosh (z+ia)\pm 1\}]<\pi-d_1$$

$$-d_2<\arg [\sqrt{q}\{\cosh (z-ia)\pm 1\}]<\pi-d_2$$

**20.7.17**

Path $C_4$: from $d_2-i\infty$ to $2\pi+i\infty-d_1$

(same $d_1$, $d_2$ as in **20.7.16**)

**20.7.18**

$$F_\nu(a)M_\nu^j(z, q)=\frac{e^{-i\nu\frac{\pi}{2}}}{\pi}\oint_{C_j} e^{2i\sqrt{q}\,w}F_\nu(t)dt \qquad j=3, 4$$

where $M_\nu^j(z, q)$ is also given by **20.4.12.**

**20.7.19** Path $C_1$: from $-d_1+i\infty$ to $2\pi-d_1+i\infty$

$$F_\nu(a)M_\nu^{(1)}(z, q)=\frac{e^{-i\nu\frac{\pi}{2}}}{2\pi}\oint_{C_1} e^{2i\sqrt{q}\,w}F_\nu(t)dt$$

See [20.36], section **2.68.**

If $\nu$ is an integer the paths can be simplified; for in that case $F_\nu(t)$ is periodic and the integrals exist when the path is taken from 0 to $2\pi$. Still further simplifications are possible, if $z$ is also real.

The following are among the more important integral representations for the periodic functions $ce_r(z, q)$, $se_r(z, q)$ and for the associated radial solutions.

Let $r=2s+p$, $p=0$ or 1

**20.7.20**

$$ce_r(z, q)=\rho_r\int_0^{\pi/2}\cos\left(2\sqrt{q}\cos z\cos t-p\frac{\pi}{2}\right)ce_r(t, q)dt$$

**20.7.21**
$$ce_r(z,\ q)=\sigma_r\int_0^{\pi/2}\cosh\ (2\sqrt{q}\sin z\sin t)[(1-p)+p\cos z\cos t]ce_r(t,\ q)dt$$

**20.7.22**
$$se_r(z,\ q)=\rho_r\int_0^{\pi/2}\sin\left(2\sqrt{q}\cos z\cos t+p\,\frac{\pi}{2}\right)\sin z\sin t\ se_r(t,\ q)dt$$

**20.7.23**
$$se_r(z,\ q)=\sigma_r\int_0^{\pi/2}\sinh\ (2\sqrt{q}\sin z\sin t)[(1-p)\cos z\cos t+p]se_r(t,\ q)dt$$

where

**20.7.24** $\rho_r=\frac{2}{\pi}ce_{2s}\left(\frac{\pi}{2},q\right)/A_0^{2s}(q);\ p=0\rho_r=\frac{-2}{\pi}ce'_{2s+1}\left(\frac{\pi}{2},q\right)/\sqrt{q}A_1^{2s+1}(q)$ if $p=1$, for functions $ce_r(z,\ q)$

$\rho_r=\frac{-4}{\pi}se'_{2s}\left(\frac{\pi}{2},q\right)/\sqrt{q}B_2^{2s}(q);\ \rho_r=\frac{4}{\pi}se_{2s+1}\left(\frac{\pi}{2},q\right)/B_1^{2s+1}(q)$, for functions $se_r(z,\ q)$

$\sigma_r=\frac{2}{\pi}ce_{2s}(0,\ q)/A_0^{2s}(q)$ if $p=0$; $\quad\sigma_r=\frac{4}{\pi}ce_{2s+1}(0,\ q)/A_1^{2s+1}(q)$, if $p=1$; associated with functions $ce_r(z,\ q)$

$\sigma_r=\frac{4}{\pi}se'_{2s}(0,q)/\sqrt{q}B_2^{2s}(q)$, if $p=0$; $\quad\sigma_r=\frac{2}{\pi}se'_{2s+1}(0,\ q)/\sqrt{q}B_1^{2s+1}(q)$, if $p=1$; associated with $se_r(z,\ q)$

### Integrals Involving Bessel Function Kernels

Let

**20.7.25**
$$u=\sqrt{2q(\cosh 2z+\cos 2t)},\ (\mathscr{R}\cosh 2z>1;\ \text{if } j=1,\ \text{valid also when } z=0)$$

**20.7.26**
$$Mc_{2r}^{(j)}(z,q)=\frac{(-1)^r2}{\pi A_0^{2r}}\int_0^{\frac{\pi}{2}}Z_0^{(j)}(u)ce_{2r}(t,q)dt;\ Mc_{2r+1}^{(j)}(z,q)=\frac{(-1)^r8\sqrt{q}\cosh z}{\pi A_1^{2r+1}}\int_0^{\frac{\pi}{2}}\frac{Z_1^{(j)}(u)\cos t}{u}ce_{2r+1}(t,q)dt$$

**20.7.27**
$$Ms_{2r}^{(j)}(z,q)=\frac{(-1)^{r+1}8q\sinh 2z}{\pi B_2^{2r}}\int_0^{\frac{\pi}{2}}\frac{Z_2^{(j)}(u)\sin 2t\ se_{2r}(t,q)dt}{u^2}$$

$$Ms_{2r+1}^{(j)}(z,q)=\frac{(-1)^r8\sqrt{q}\sinh z}{\pi B_1^{2r+1}}\int_0^{\frac{\pi}{2}}\frac{Z_1^{(j)}(u)\sin t\ se_{2r+1}(t,q)dt}{u}$$

In the above the $j$-convention of **20.4.7** applies and the functions $Mc$, $Ms$ are defined in **20.5.1–20.5.4.** (These solutions are normalized so that they approach the corresponding Bessel-Hankel functions as $\mathscr{R}z\rightarrow\infty$.)

### Other Integrals for $Mc_r^{(1)}(z,q)$ and $Ms_r^{(1)}(z,q)$

**20.7.28**
$$Mc_r^{(1)}(z,q)=\frac{(-1)^s2}{\pi ce_r(0,q)}\int_0^{\frac{\pi}{2}}\cos\left(2\sqrt{q}\cosh z\cos t-p\,\frac{\pi}{2}\right)ce_r(t,q)dt$$

**20.7.29**
$$Mc_r^{(1)}(z,q)=\tau_r\int_0^{\frac{\pi}{2}}[(1-p)+p\cosh z\cos t]\cos\ (2\sqrt{q}\sinh z\sin \mathrm{t})ce_r(t,q)dt$$

$$r=2s+p,\ p=0,1;\ \tau_r=\frac{2}{\pi}(-1)^s/ce_{2s}\left(\frac{\pi}{2},q\right),\ \text{if } p=0;\ \tau_r=\frac{2}{\pi}(-1)^{s+1}2\sqrt{q}/ce'_{2s+1}\left(\frac{\pi}{2},q\right)$$

**20.7.30**
$$Ms_{2r+1}^{(1)}(z,q)=\frac{2}{\pi}\frac{(-1)^r}{se_{2r+1}\left(\frac{\pi}{2},q\right)}\int_0^{\frac{\pi}{2}}\sin\ (2\sqrt{q}\sinh z\sin t)se_{2r+1}(t,q)dt$$

**20.7.31**
$$Ms_{2r+1}^{(1)}(z,q)=\frac{4}{\pi}\frac{\sqrt{q}(-1)^r}{se'_{2r+1}(0,q)}\int_0^{\frac{\pi}{2}}\sinh z\sin \mathrm{t}\cos\ (2\sqrt{q}\cosh z\cos t)se_{2r+1}(t,q)dt$$

**20.7.32**
$$Ms_{2r}^{(1)}(z,q)=\frac{4}{\pi}\sqrt{q}\frac{(-1)^{r+1}}{se'_{2r}(0,q)}\int_0^{\frac{\pi}{2}}\sin\ (2\sqrt{q}\cosh z\cos t)\ [\sinh z\sin t\ se_{2r}\ (t,q)]dt$$

**20.7.33**
$$Ms_{2r}^{(1)}(z,q)=\frac{4}{\pi}\frac{(-1)^r\sqrt{q}}{se'_{2r}\left(\frac{\pi}{2},q\right)}\int_0^{\frac{\pi}{2}}\sin\ (2\sqrt{q}\sinh z\sin t)[\cosh z\cos t\ se_{2r}(t,q)]dt$$

Further with $w=\cosh z\cos\alpha\cos t+\sinh z\sin\alpha\sin t$

**20.7.34** $$ce_r(\alpha,q)Mc_r^{(1)}(z,q)=\frac{(-1)^s(i)^{-p}}{2\pi}\int_0^{2\pi}e^{2i\sqrt{q}\,w}ce_r(t,q)dt$$

**20.7.35** $$se_r(\alpha,q)Ms_r^{(1)}(z,q)=\frac{(-1)^s(-i)^p}{2\pi}\int_0^{2\pi}e^{2i\sqrt{q}\,w}se_r(t,q)dt.$$

The above can be differentiated with respect to $\alpha$, and we obtain

**20.7.36** $$ce_r'(\alpha,q)Mc_r^{(1)}(z,q)=\frac{(-1)^s(i)^{-p+1}\sqrt{q}}{\pi}\int_0^{2\pi}e^{2i\sqrt{q}\,w}\frac{\partial w}{\partial\alpha}ce_r(t,q)dt$$

**20.7.37** $$se_r'(\alpha,q)Ms_r^{(1)}(z,q)=\frac{(-1)^{s+p}(i)^{-p+1}\sqrt{q}}{\pi}\int_0^{2\pi}e^{2i\sqrt{q}\,w}\frac{\partial w}{\partial\alpha}se_r(t,q)dt$$

### Integrals With Infinite Limits

$$r=2s+p$$

In **20.7.38–20.7.41** below, $z$ and $q$ are positive.

**20.7.38** $$Mc_r^{(1)}(z,q)=\gamma_r\int_0^\infty\sin\left(2\sqrt{q}\cosh z\cosh t+p\frac{\pi}{2}\right)Mc_r^{(1)}(t,q)dt$$

$$\gamma_r=2ce_{2s}\left(\frac{\pi}{2},q\right)/\pi A_0^{2s},\text{ if }p=0\qquad\gamma_r=2ce_{2s+1}'\left(\frac{\pi}{2},q\right)/\sqrt{q}\,\pi A_1^{2s+1},\text{ if }p=1$$

**20.7.39** $$Ms_r^{(1)}(z,q)=\gamma_r\int_0^\infty\sinh z\sinh t\left[\cos\left(2\sqrt{q}\cosh z\cosh t-p\frac{\pi}{2}\right)\right]Ms_r^{(1)}(t,q)dt$$

$$\gamma_r=-4se_{2s}'\left(\frac{\pi}{2},q\right)/\sqrt{q}\pi B_2^{2s},\text{ if }p=0\qquad\gamma_r=-4se_{2s+1}\left(\frac{\pi}{2},q\right)/\pi B_1^{2s+1},\text{ if }p=1$$

**20.7.40** $$Mc_r^{(2)}(z,q)=\gamma_r\int_0^\infty\cos\left(2\sqrt{q}\cosh z\cosh t-p\frac{\pi}{2}\right)Mc_r^{(1)}(t,q)dt$$

$$\gamma_r=-2ce_{2s}(\tfrac{1}{2}\pi,q)/\pi A_0^{2s},\text{ if }p=0\qquad\gamma_r=2ce_{2s+1}'(\tfrac{1}{2}\pi,q)/\pi\sqrt{q}A_1^{2s+1},\text{ if }p=1$$

**20.7.41** $$Ms_r^{(2)}(z,q)=\gamma_r\int_0^\infty\sin\left(2\sqrt{q}\cosh z\cosh t+p\frac{\pi}{2}\right)\sinh z\sinh t\,Ms_r^{(1)}(t,q)dt$$

$$\gamma_r=-4se_{2s}'(\tfrac{1}{2}\pi,q)/\sqrt{q}\,\pi B_2{}^{2s},\text{ if }p=0\qquad\gamma_r=4se_{2s+1}(\tfrac{1}{2}\pi,q)/\pi B_1{}^{2s+1},\text{ if }p=1$$

Additional forms in [20.30], [20.36], [20.15].

## 20.8. Other Properties

### Relations Between Solutions for Parameters $q$ and $-q$

Replacing $z$ by $\frac{1}{2}\pi-z$ in **20.1.1** one obtains

**20.8.1** $$y''+(a+2q\cos 2z)y=0$$

Hence if $u(z)$ is a solution of **20.1.1** then $u(\frac{1}{2}\pi-z)$ satisfies **20.8.1.** It can be shown that

**20.8.2**

$$a(-\nu,q)=a(\nu,-q)=a(\nu,q),\ \nu\text{ not an integer}$$

$$c_{2m}^{\nu}(-q)=\rho(-1)^m c_{2m}^{\nu}(q),\ \nu\text{ not an integer}$$

($c_{2m}$ defined in **20.3.8**) and $\rho$ depending on the normalization;

$$F_\nu(z,-q)=\rho e^{-i\nu\pi/2}F_\nu\left(z+\frac{\pi}{2},q\right)=\rho e^{i\nu\pi/2}F_\nu\left(z-\frac{\pi}{2},q\right)$$

**20.8.3**

$$a_{2r}(-q)=a_{2r}(q);\ b_{2r}(-q)=b_{2r}(q), \text{ for integral } \nu$$

$$a_{2r+1}(-q)=b_{2r+1}(q),\ b_{2r+1}(-q)=a_{2r+1}(q)$$

**20.8.4**

$$ce_{2r}(z,\ -q)=(-1)^r ce_{2r}(\tfrac{1}{2}\pi-z,\ q)$$

$$ce_{2r+1}(z,\ -q)=(-1)^r se_{2r+1}(\tfrac{1}{2}\pi-z,\ q)$$

$$se_{2r+1}(z,\ -q)=(-1)^r ce_{2r+1}(\tfrac{1}{2}\pi-z,\ q)$$

$$se_{2r}(z,\ -q)=(-1)^{r-1} se_{2r}(\tfrac{1}{2}\pi-z,\ q)$$

For the coefficients associated with the above solutions for integral $\nu$:

**20.8.5**

$$A_{2m}^{2r}(-q)=(-1)^{m-r}A_{2m}^{2r}(q);$$

$$B_{2m}^{2r}(-q)=(-1)^{m-r}B_{2m}^{2r}(q)$$

$$A_{2m+1}^{2r+1}(-q)=(-1)^{m-r}B_{2m+1}^{2r+1}(q);$$

$$B_{2m+1}^{2r+1}(-q)=(-1)^{m-r}A_{2m+1}^{2r+1}(q).$$

For the corresponding modified equation

**20.8.6** $$y''-(a+2q\cosh 2z)y=0$$

**20.8.7**

$$M_\nu^{(j)}(z,\ -q)=M_\nu^{(j)}\left(z+i\frac{\pi}{2},\ q\right),$$

$M_\nu^{(j)}(z,\ q)$ defined in **20.4.12.**

For integral values of $\nu$ let

**20.8.8**

$$Ie_{2r}(z,\ q)=\sum_{k=0}^{\infty}(-1)^{k+s}A_{2k}[I_{k-s}(u_1)I_{k+s}(u_2)$$
$$+I_{k+s}(u_1)I_{k-s}(u_2)]/A_{2s}\epsilon_s$$

$$Io_{2r}(z,\ q)=\sum_{k=1}^{\infty}(-1)^{k+s}B_{2k}[I_{k-s}(u_1)I_{k+s}(u_2)$$
$$-I_{k+s}(u_1)I_{k-s}(u_2)]/B_{2s}$$

$$Ie_{2r+1}(z,\ q)=\sum_{k=0}^{\infty}(-1)^{k+s}B_{2k+1}[I_{k-s}(u_1)I_{k+s+1}(u_2)$$
$$+I_{k+s+1}(u_1)I_{k-s}(u_2)]/B_{2s+1}$$

$$Io_{2r+1}(z,\ q)=\sum_{k=0}^{\infty}(-1)^{k+s}A_{2k+1}[I_{k-s}(u_1)I_{k+s+1}(u_2)$$
$$-I_{k+s+1}(u_1)I_{k-s}(u_2)]/A_{2s+1}$$

**20.8.9**

$$Ke_{2r}(z,\ q)=\sum_{k=0}^{\infty}A_{2k}[I_{k-s}(u_1)K_{k+s}(u_2)$$
$$+I_{k+s}(u_1)K_{k-s}(u_2)]/A_{2s}\epsilon_s$$

* $$Ko_{2r}(z,\ q)=\sum_{k=0}^{\infty}B_{2k}[I_{k-s}(u_1)K_{k+s}(u_2)$$
* $$-I_{k+s}(u_1)K_{k-s}(u_2)]/B_{2s}$$

$$Ke_{2r+1}(z,\ q)=\sum_{k=0}^{\infty}B_{2k+1}[I_{k-s}(u_1)K_{k+s+1}(u_2)$$
$$-I_{k+s+1}(u_1)K_{k-s}(u_2)]/B_{2s+1}$$

$$Ko_{2r+1}(z,\ q)=\sum_{k=0}^{\infty}A_{2k+1}[I_{k-s}(u_1)K_{k+s+1}(u_2)$$
$$+I_{k+s+1}(u_1)K_{k-s}(u_2)]/A_{2s+1}$$

where $I_m(x)$, $K_m(x)$ are the modified Bessel functions, $u_1$, $u_2$ are defined below **20.6.10.** Superscripts are omitted, $\epsilon_s=2$, if $s=0$, $\epsilon_s=1$ if $s\neq 0$.

Then for functions of first kind:

**20.8.10**

$$Mc_{2r}^{(1)}(z,\ -q)=(-1)^r Ie_{2r}(z,\ q)$$

$$Ms_{2r}^{(1)}(z,\ -q)=(-1)^r Io_{2r}(z,\ q)$$

$$Mc_{2r+1}^{(1)}(z,\ -q)=(-1)^r i Ie_{2r+1}(z,\ q)$$

$$Ms_{2r+1}^{(1)}(z,\ -q)=(-1)^r i Io_{2r+1}(z,\ q)$$

For the Mathieu-Hankel function of first kind:

**20.8.11**

$$Mc_{2r}^{(3)}(z,\ -q)=(-1)^{r+1}i\frac{2}{\pi}Ke_{2r}(z,\ q)$$

$$Ms_{2r}^{(3)}(z,\ -q)=(-1)^{r+1}i\frac{2}{\pi}Ko_{2r}(z,\ q)$$

$$Mc_{2r+1}^{(3)}(z,\ -q)=(-1)^{r+1}\frac{2}{\pi}Ke_{2r+1}(z,\ q)$$

$$Ms_{2r+1}^{(3)}(z,\ -q)=(-1)^{r+1}\frac{2}{\pi}Ko_{2r+1}(z,\ q)$$

For $M_r^{(j)}(z,\ -q)$, $j=2,\ 4$, one may use the definitions

$$M_r^{(2)}=-i(M_r^{(3)}-M_r^{(1)});\ M_r=Mc_r \text{ or } Ms_r$$

also

$$M_r^{(4)}(z,\ -q)=2M_r^{(1)}(z,\ -q)-M_r^{(3)}(z,\ -q)$$

$M=Mc$ or $Ms$; for real $z$, $q$, $M_r^{(j)}(z,\ -q)$ are in general complex if $j=2,\ 4$.

### Zeros of the Functions for Real Values of *q*.

See [20.36], section **2.8** for further results.

**Zeros of $ce_r(z,\ q)$ and $se_r(z,\ q)$, $Mc_r^{(1)}(z,\ q)$, $Ms_r^{(1)}(z,\ q)$.**

In $0\leq z<\pi$, $ce_r(z,\ q)$ and $se_r(z,\ q)$ have $r$ real zeros. *

There are complex zeros if $q>0$.

If $z_0=x_0+iy_0$ is any zero of $ce_r(z,\ q)$, $se_r(z,\ q)$ in

$$-\frac{\pi}{2}<x_0<\frac{\pi}{2}, \text{ then } k\pi\pm z_0,\ k\pi\pm\bar{z}_0$$

are also zeros, $k$ an integer.

---

*See page II.

In the strip $-\frac{\pi}{2}<x_0<\frac{\pi}{2}$, the imaginary zeros of $ce_r(z, q)$, $se_r(z, q)$ are the real zeros of $Ce_r(z, q)$, $Se_r(z, q)$, hence also the real zeros of $Mc_r^{(1)}(z, q)$ and $Ms_r^{(1)}(z, q)$, respectively.

For small $q$, the large zeros of $Ce_r(z, q)$, $Se_r(z, q)$ approach the zeros of $J_r(2\sqrt{q}\cosh z)$.

### Tabulation of Zeros

Ince [20.56] tabulates the first "non-trivial" zero $\left(\text{i.e. different from } 0, \frac{\pi}{2}, \pi\right)$ for $ce_r(z)$, $se_r(z)$, $r=2(1)5$ and for $se_6(z)$ to within $^\circ 10^{-4}$, for $q=0(1)10(2)40$. He also gives the "turning" points (zeros of the derivative) and also expansions for them for small $q$. Wiltse and King [20.61,2] tabulate the first two (non-trivial) zeros of $Mc_r^{(1)}(z, q)$ and $Ms_r^{(1)}(z, q)$ and of their derivatives $r=0, 1, 2$ for 6 or 7 values of $q$ between .25 and 10. The graphs reproduced here indicate their location.

Between two real zeros of $Mc_r^{(1)}(z, q)$, $Ms_r^{(1)}(z, q)$ there is a zero of $Mc_r^{(2)}(z, q)$, $Ms_r^{(2)}(z, q)$, respectively. No tabulation of such zeros exists yet.

Available tables are described in the References.

The most comprehensive tabulation of the characteristic values $a_r$, $b_r$ (in a somewhat different notation) and of the coefficients proportional to $A_m$ and $B_m$ as defined in **20.5.4** and **20.5.5** can be found in [20.58]. In addition, the table contains certain important "joining factors", with the aid of which it is possible to obtain values of $Mc_r^{(j)}(z, q)$ and $Ms_r^{(j)}(z, q)$ as well as their derivatives, at $x=0$. Values of the functions $ce_r(x, q)$ and $se_r(x, q)$ for orders up to five or six can be found in [20.56]. Tabulations of less extensive character, but important in some aspects, are outlined in the other references cited. In this chapter only representative values of the various functions are given, along with several graphs.

### Special Values for Arguments 0 and $\frac{\pi}{2}$

**20.8.12**

$$ce_{2r}\left(\frac{\pi}{2}, q\right)=(-1)^r g_{e,2r}(q) A_0^{2r}(q)\sqrt{\frac{\pi}{2}}$$

$$ce'_{2r+1}\left(\frac{\pi}{2}, q\right)=(-1)^{r+1} g_{e,2r+1}(q) A_1^{2r+1}(q)\sqrt{\frac{\pi}{2}q}$$

$$se'_{2r}\left(\frac{\pi}{2}, q\right)=(-1)^r g_{o,2r}(q) B_2^{2r}(q)\cdot q\sqrt{\frac{\pi}{2}}$$

$$se_{2r+1}\left(\frac{\pi}{2}, q\right)=(-1)^r g_{o,2r+1}(q) B_1^{2r+1}(q)\sqrt{\frac{\pi}{2}q}$$

$$Mc_r^{(1)}(0, q)=\sqrt{\frac{2}{\pi}}\frac{1}{g_{e,r}(q)}$$

$$Mc_r^{(2)}(0, q)=-\sqrt{\frac{2}{\pi}}f_{e,r}(q)/g_{e,r}(q)$$

$$\frac{d}{dz}[Mc_r^{(2)}(z, q)]_{z=0}=\sqrt{\frac{2}{\pi}}g_{e,r}(q)$$

$$\frac{d}{dz}[Ms_r^{(1)}(z, q)]_{z=0}=\sqrt{\frac{2}{\pi}}\frac{1}{g_{o,r}(q)}$$

$$\frac{d}{dz}\left[Ms_r^{(2)}(z, q)\right]_{z=0}=\sqrt{\frac{2}{\pi}}f_{o,r}(q)/g_{o,r}(q)$$

$$Ms_r^{(2)}(z, q)=-g_{o,r}(q)\sqrt{\frac{2}{\pi}}$$

The functions $f_{o,r}$, $g_{o,r}$, $f_{e,r}$, $g_{e,r}$ are tabulated in [20.58] for $q\leq 25$.

## 20.9. Asymptotic Representations

The representations given below are applicable to the *characteristic solutions*, for real values of $q$, unless otherwise noted. The Floquet exponent $\nu$ is defined below, as in [20.36] to be as follows:

In solutions associated with $a_r$: $\nu=r$

In solutions associated with $b_r$: $\nu=-r$.

For the functions defined in **20.6.7–20.6.10:**

**20.9.1**

$$\begin{aligned}&Mc_r^{(3)}(z, q)\\&(-1)^r Ms_r^{(3)}(z, q)\end{aligned}\sim\frac{e^{i\left(2\sqrt{q}\cosh z-\frac{\nu\pi}{2}-\frac{\pi}{4}\right)}}{\pi^{\frac{1}{2}}q^{1/4}(\cosh z-\sigma)^{\frac{1}{2}}}\sum_{m=0}^{\infty}\frac{D_m}{[-4i\sqrt{q}(\cosh z-\sigma)]^m}$$

where $D_{-1}=D_{-2}=0$; $D_0=1$, and the coefficients $D_m$ are obtainable from the following recurrence formula:

**20.9.2**

$$(m+1)D_{m+1}+\left[\left(m+\frac{1}{2}\right)^2-\left(m+\frac{1}{4}\right)8i\sqrt{q}\,\sigma+2q-a\right]D_m+\left(m-\frac{1}{2}\right)[16q(1-\sigma^2)-8i\sqrt{q}\,\sigma m]D_{m-1}+4q(2m-3)(2m-1)(1-\sigma^2)D_{m-2}=0$$

**20.9.3**

$$\begin{aligned}&Mc_r^{(4)}(z, q)\\&(-1)^r Ms_r^{(4)}(z, q)\end{aligned}\sim\frac{e^{-i\left[2\sqrt{q}\cosh z-\frac{1}{2}\nu\pi-\frac{1}{4}\pi\right]}}{\pi^{\frac{1}{2}}q^{1/4}(\cosh z-\sigma)^{\frac{1}{2}}}\sum_{m=0}^{\infty}\frac{d_m}{[4i\sqrt{q}(\cosh z-\sigma)]^m}$$

$d_{-1}=d_{-2}=0$; $d_0=1$, and

**20.9.4**

$$(m+1)d_{m+1}+\left[\left(m+\frac{1}{2}\right)^2+\left(m+\frac{1}{4}\right)8i\sqrt{q}\,\sigma\right.$$
$$\left.+2q-a\right]d_m+\left(m-\frac{1}{2}\right)[16q(1-\sigma^2)+8i\sqrt{q}\,\sigma m]d_{m-1}$$
$$+4q(2m-3)(2m-1)(1-\sigma^2)d_{m-2}=0.$$

In the above

$$-2\pi<\arg\sqrt{q}\cosh z<\pi$$
$$|\cosh z-\sigma|>|\sigma\pm 1|,\ \mathscr{R}z>0,$$

but $\sigma$ is otherwise arbitrary. If $\sigma^2=1$, **20.9.2** and **20.9.4** become three-term recurrence relations.

Formulas **20.9.1** and **20.9.3** are valid for arbitrary $a$, $q$, provided $\nu$ is also known; they give multiples of **20.4.12,** normalized so as to approach the corresponding Hankel functions $H_\nu^{(1)}(\sqrt{q}e^z)$, $H_\nu^{(2)}(\sqrt{q}e^z)$, as $z\rightarrow\infty$. See [20.36], section **2.63.** The formula is especially useful if $|\cosh z|$is large and $q$ is not too large; thus if $\sigma=-1$, the absolute ratio of two successive terms in the expansion is essentially

$$\left|\left(\frac{\sqrt{q}}{m}+\frac{m}{4\sqrt{q}}+2\right)/(\cosh z+1)\right|.$$

If $a$, $q$, $z$, $\nu$ are real, the real and imaginary components of $Mc_r^{(3)}(z,q)$ are $Mc_r^{(1)}(z,q)$ and $Mc_r^{(2)}(z,q)$, respectively; similarly for the components of $Ms_r^{(3)}(z,q)$. If the parameters are complex

**20.9.5** $Mc_r^{(1)}(z,q)=\frac{1}{2}\,[Mc_r^{(3)}(z,q)+Mc_r^{(4)}(z,q)]$

**20.9.6** $Mc_r^{(2)}(z,q)=-\frac{i}{2}\,[Mc_r^{(3)}(z,q)-Mc_r^{(4)}(z,q)]$

Replacing $c$ by $s$ in the above will yield corresponding relations among $Ms_r^{(j)}(z,q)$.

Formulas in which the parameter $a$ does not enter explicitly:

### Goldstein's Expansions

**20.9.7**

$$Mc_r^{(3)}(z,q)\sim iMs_{r+1}^{(3)}(z,q)$$
$$\approx[F_0(z)-iF_1(z)]e^{i\phi}/\pi^{\frac{1}{2}}q^{\frac{1}{4}}(\cosh z)^{\frac{1}{2}}$$

where

**20.9.8**

$$\phi=2\sqrt{q}\sinh z-\frac{1}{2}(2r+1)\arctan\sinh z,$$
$$\mathscr{R}z>0,\ q>>1,\ w=2r+1$$

**20.9.9**

$$F_0(z)\sim 1+\frac{w}{8\sqrt{q}\cosh^2 z}$$
$$+\frac{1}{2048q}\left[\frac{w^4+86w^2+105}{\cosh^4 z}-\frac{w^4+22w^2+57}{\cosh^2 z}\right]$$
$$+\frac{1}{16384q^{3/2}}\left[\frac{-(w^5+14w^3+33w)}{\cosh^2 z}\right.$$
$$\left.-\frac{(2w^5+124w^3+1122w)}{\cosh^4 z}+\frac{3w^5+290w^3+1627w}{\cosh^6 z}\right]+\dots$$

**20.9.10**

$$F_1(z)\sim\frac{\sinh z}{\cosh^2 z}\left[\frac{w^2+3}{32\sqrt{q}}+\frac{1}{512q}\left(w^3+3w+\frac{4w^3+44w}{\cosh^2 z}\right)\right.$$
$$+\frac{1}{16384q^{3/2}}\left\{5w^4+34w^2+9\right.$$
$$-\frac{(w^6-47w^4+667w^2+2835)}{12\cosh^2 z}$$
$$\left.\left.+\frac{(w^6+505w^4+12139w^2+10395)}{12\cosh^4 z}\right\}\right]+\dots$$

See [20.18] for details and an added term in $q^{-5/2}$; a correction to the latter is noted in [20.58].

The expansions **20.9.7** are especially useful when $q$ is large and $z$ is bounded away from zero. The order of magnitude of $Mc_r^{2}(0,q)$ cannot be obtained from the expansion. The expansion can also be used, with some success, for $z=ix$, when $q$ is large, if $|\cos x|>>0$; they fail at $x=\frac{1}{2}\pi$. Thus, if $q$, $x$ are real, one obtains

**20.9.11**

$$ce_r(x,q)\sim\frac{ce_r(0,q)2^{r-\frac{1}{2}}}{F_0(0)}\{W_1[P_0(x)-P_1(x)]$$
$$+W_2[P_0(x)+P_1(x)]\}$$

**20.9.12**

$$se_{r+1}(x,q)\sim se'_{r+1}(0,q)\tau_{r+1}\{W_1[P_0(x)-P_1(x)]$$
$$-W_2[P_0(x)+P_1(x)]\}$$

In the above, $P_0(x)$ and $P_1(x)$ are obtainable from $F_0(z)$, $F_1(x)$ in **20.9.9–20.9.10** by replacing $\cosh z$ with $\cos x$ and $\sinh z$ with $\sin x$. Thus $P_0(x)=F_0(ix)$; $P_1(x)=-iF_1(ix)$:

**20.9.13**

$$W_1=e^{2\sqrt{q}\sin x}[\cos(\tfrac{1}{2}x+\tfrac{1}{4}\pi)]^{2r+1}/(\cos x)^{r+1}$$

$$W_2=e^{-2\sqrt{q}\sin x}[\sin(\tfrac{1}{2}x+\tfrac{1}{4}\pi)]^{2r+1}/(\cos x)^{r+1}$$

**20.9.14**

$$\tau_{r+1}\sim 2^{r-\frac{1}{2}}\bigg/\left[2\sqrt{q}-\tfrac{1}{4}w-\frac{(2w^2+3)}{64\sqrt{q}}-\frac{(7w^3+47w)}{1024q}-\ldots\right]$$

See **20.9.23–20.9.24** for expressions relating to $ce_r(0, q)$ and $se'_r(0, q)$. When $|\cos x|>\sqrt{4r+2}/q^{\frac{1}{4}}$, **20.9.11–20.9.12** are useful. The approximations become poorer as $r$ increases.

### Expansions in Terms of Parabolic Cylinder Functions

(Good for angles close to $\frac{1}{2}\pi$, for large values of $q$, especially when $|\cos x|<2^{\frac{1}{2}}/q^{\frac{1}{4}}$.) Due to Sips [20.44–20.46].

**20.9.15** $\quad ce_r(x, q)\sim C_r[Z_0(\alpha)+Z_1(\alpha)]$

**20.9.16**

$$se_{r+1}(x, q)\sim S_r[Z_0(\alpha)-Z_1(\alpha)]\sin x, \qquad \alpha=2q^{\frac{1}{4}}\cos x.$$

Let $D_k=D_k(\alpha)=(-1)^k e^{\frac{1}{4}\alpha^2}\dfrac{d^k}{d\alpha^k}\,e^{-\frac{1}{4}\alpha^2}$.

**20.9.17**

$$Z_0(\alpha)\sim D_r+\frac{1}{4q^{\frac{1}{2}}}\left[-\frac{D_{r+4}}{16}+\frac{3}{2}\binom{r}{4}D_{r-4}\right]$$
$$+\frac{1}{16q}\left[\frac{D_{r+8}}{512}-\frac{(r+2)D_{r+4}}{16}+\frac{3}{2}(r-1)\binom{r}{4}D_{r-4}\right.$$
$$\left.+\frac{315}{4}\binom{r}{8}D_{r-8}\right]+\ldots$$

**20.9.18**

$$Z_1(\alpha)\sim\frac{1}{4q^{\frac{1}{2}}}\left[-\frac{1}{4}D_{r+2}-\frac{r(r-1)}{4}D_{r-2}\right]$$
$$+\frac{1}{16q}\left[\frac{D_{r+6}}{64}+\frac{(r^2-25r-36)}{64}D_{r+2}\right.$$
$$\left.+\frac{r(r-1)(-r^2-27r+10)}{64}D_{r-2}-\frac{45}{4}\binom{r}{6}D_{r-6}+\ldots\right]$$

**20.9.19**

$$C_r\sim\left(\frac{\pi}{2}\right)^{\frac{1}{4}}q^{\frac{1}{8}}/(r!)^{\frac{1}{2}}\left[1+\frac{2r+1}{8q^{\frac{1}{2}}}\right.$$
$$\left.+\frac{r^4+2r^3+263r^2+262r+108}{2048q}+\frac{f_1}{16384q^{\frac{3}{2}}}+\ldots\right]^{-\frac{1}{2}}$$
$$f_1=6r^5+15r^4+1280r^3+1905r^2+1778r+572$$

**20.9.20**

$$S_r\sim\left(\frac{\pi}{2}\right)^{\frac{1}{4}}q^{\frac{1}{8}}/(r!)^{\frac{1}{2}}\left[1-\frac{2r+1}{8q^{\frac{1}{2}}}\right.$$
$$\left.+\frac{r^4+2r^3-121r^2-122r-84}{2048q}+\frac{f_2}{16384q^{\frac{3}{2}}}+\ldots\right]^{-\frac{1}{2}}$$
$$f_2=2r^5+5r^4-416r^3-629r^2-1162r-476$$

It should be noted that **20.9.15** is also valid as an approximation for $se_{r+1}(x, q)$, but **20.9.16** may give slightly better results. See [20.4.]

### Explicit Expansions for Orders 0, 1, to Terms in $q^{-3/2}$ ($q$ Large)

**20.9.21** For $r=0$:

$$Z_0\sim D_0-\frac{D_4}{64\sqrt{q}}+\frac{1}{16q}\left(-\frac{D_4}{8}+\frac{D_8}{512}\right)\ *$$
$$+\frac{1}{64q^{3/2}}\left(-\frac{99D_4}{256}+\frac{3D_8}{256}-\frac{D_{12}}{24576}\right)+\ldots$$

$$Z_1\sim\frac{-D_2}{16\sqrt{q}}+\frac{1}{16q}\left(-\frac{9D_2}{16}+\frac{D_6}{64}\right)$$
$$+\frac{1}{64q^{3/2}}\left(-\frac{61D_2}{32}+\frac{25D_6}{256}-\frac{5D_{10}}{10240}\right)+\ldots$$

**20.9.22** For $r=1$:

$$Z_0\sim D_1-\frac{D_5}{64\sqrt{q}}+\frac{1}{16q}\left(-\frac{3D_5}{16}+\frac{D_9}{512}\right)$$
$$+\frac{1}{64q^{3/2}}\left(-\frac{207D_5}{256}+\frac{D_9}{64}-\frac{D_{13}}{24576}\right)+\ldots$$

$$Z_1\sim\frac{-D_3}{16\sqrt{q}}+\frac{1}{16q}\left(-\frac{15D_3}{16}+\frac{D_7}{64}\right)$$
$$+\frac{1}{64q^{3/2}}\left(-\frac{153D_3}{32}+\frac{35D_7}{256}-\frac{D_{11}}{2048}\right)+\ldots$$

### Formulas Involving $ce_r(0, q)$ and $se_r(0, q)$

**20.9.23**

$$\frac{ce_0(0, q)}{ce_0(\frac{1}{2}\pi, q)}\sim 2\sqrt{2}\,e^{-2\sqrt{q}}\left(1+\frac{1}{16\sqrt{q}}+\frac{9}{256q}+\ldots\right)$$

$$\frac{ce_2(0, q)}{ce_2(\frac{1}{2}\pi, q)}\sim-32q\sqrt{2}\,e^{-2\sqrt{q}}\left(1-\frac{1}{16\sqrt{q}}+\frac{29}{128q}+\ldots\right)$$

---

*See page II.

$$\frac{ce_1(0,q)}{ce_1'(\frac{1}{2}\pi,q)}\sim-4\sqrt{2}e^{-2\sqrt{q}}\left(1+\frac{3}{16\sqrt{q}}+\frac{45}{256q}+\ldots\right)$$

$$\frac{ce_3(0,q)}{ce_3'(\frac{1}{2}\pi,q)}\sim\frac{64}{3}\,q\sqrt{2}\,e^{-2\sqrt{q}}\left(1-\frac{3}{16\sqrt{q}}+\frac{47}{128q}+\ldots\right)$$

**20.9.24**

$$\frac{se_1'(0,q)}{se_1(\frac{1}{2}\pi,q)}\sim4\,q\sqrt{2}\,e^{-2\sqrt{q}}\left(1-\frac{3}{16\sqrt{q}}-\frac{11}{256q}+\ldots\right)$$

$$\frac{se_3'(0,q)}{se_3(\frac{1}{2}\pi,q)}\sim-64\,q\sqrt{2}\,e^{-2\sqrt{q}}\left(1-\frac{21}{16\sqrt{q}}-\frac{17}{128q}+\ldots\right)$$

$$\frac{se_2'(0,q)}{se_2'(\frac{1}{2}\pi,q)}\sim-8\,q\sqrt{2}\,e^{-2\sqrt{q}}\left(1-\frac{9}{16\sqrt{q}}-\frac{39}{256q}+\ldots\right)$$

$$\frac{se_4'(0,q)}{se_4'(\frac{1}{2}\pi,q)}\sim\frac{128}{3}\,q\sqrt{2}e^{-2\sqrt{q}}\left(1-\frac{31}{16\sqrt{q}}-\frac{15}{128q}+\ldots\right)$$

For higher orders, these ratios are increasingly more difficult to obtain. One method of estimating values at the origin is to evaluate both **20.9.11** and **20.9.15** for some $x$ where both expansions are satisfactory, and so to use **20.9.11** as a means to solve for $ce_r(0,q)$; similarly for $se_r'(0,q)$.

Other asymptotic expansions, valid over various regions of the complex $z$-plane, for real values of $a$, $q$, have been given by Langer [20.25]. It is not always easy, however, to determine the linear combinations of Langer's solutions which coincide with those defined here.

## 20.10. Comparative Notations

# 21. Spheroidal Wave Functions

## Mathematical Properties

### 21.1. Definition of Elliptical Coordinates

**21.1.1** $$\xi=\frac{r_1+r_2}{2f};\quad \eta=\frac{r_1-r_2}{2f}$$

$r_1$ and $r_2$ are the distances to the foci of a family of confocal ellipses and hyperbolas; $2f$ is the distance between foci.

**21.1.2** $$a=f\xi,\ b=f\sqrt{\xi^2-1},\qquad e=\frac{f}{a}$$

$a$=semi-major axis; $b$=semi-minor axis; $e$=eccentricity.

**Equation of Family of Confocal Ellipses**

**21.1.3** $$\frac{x^2}{\xi^2}+\frac{y^2}{\xi^2-1}=f^2\qquad (1<\xi<\infty)$$

**Equation of Family of Confocal Hyperbolas**

**21.1.4** $$\frac{x^2}{\eta^2}-\frac{y^2}{1-\eta^2}=f^2\qquad (-1<\eta<1)$$

**Relations Between Cartesian and Elliptical Coordinates**

**21.1.5** $$x=f\xi\eta;\quad y=f\sqrt{(\xi^2-1)(1-\eta^2)}$$

### 21.2. Definition of Prolate Spheroidal Coordinates

If the system of confocal ellipses and hyberbolas referred to in **21.1.3** and **21.1.4** revolves around the major axis, then

**21.2.1** $$\frac{x^2}{\xi^2}+\frac{r^2}{\xi^2-1}=f^2;\qquad \frac{x^2}{\eta^2}-\frac{r^2}{1-\eta^2}=f^2$$

$$y=r\cos\phi;\quad z=r\sin\phi;\quad 0\leq\phi\leq 2\pi$$

where $\xi$, $\eta$ and $\phi$ are prolate spheroidal coordinates.

**Relations Between Cartesian and Prolate Spheroidal Coordinates**

**21.2.2**

$$x=f\xi\eta;\ y=f\sqrt{(\xi^2-1)(1-\eta^2)}\cos\phi;$$
$$z=f\sqrt{(\xi^2-1)(1-\eta^2)}\sin\phi$$

### 21.3. Definition of Oblate Spheroidal Coordinates

If the system of confocal ellipses and hyperbolas referred to in **21.1.3** and **21.1.4** revolves around the minor axis, then

**21.3.1** $$\frac{r^2}{\xi^2}+\frac{y^2}{\xi^2-1}=f^2;\qquad \frac{r^2}{\eta^2}-\frac{y^2}{1-\eta^2}=f^2$$

$$z=r\cos\phi;\quad x=r\sin\phi;\quad 0\leq\phi\leq 2\pi$$

where $\xi$, $\eta$ and $\phi$ are oblate spheroidal coordinates.

**Relations Between Cartesian and Oblate Spheroidal Coordinates**

**21.3.2**

$$x=f\xi\eta\sin\phi;\ y=f\sqrt{(\xi^2-1)(1-\eta^2)};\ z=f\xi\eta\cos\phi$$

### 21.4. Laplacian in Spheroidal Coordinates

**21.4.1**

$$\nabla^2=\frac{1}{h_\xi h_\eta h_\phi}\left[\frac{\partial}{\partial\xi}\left(\frac{h_\eta h_\phi}{h_\xi}\frac{\partial}{\partial\xi}\right)+\frac{\partial}{\partial\eta}\left(\frac{h_\xi h_\phi}{h_\eta}\frac{\partial}{\partial\eta}\right)+\frac{\partial}{\partial\phi}\left(\frac{h_\xi h_\eta}{h_\phi}\frac{\partial}{\partial\phi}\right)\right]$$

$$h_\xi^2=\left(\frac{\partial x}{\partial\xi}\right)^2+\left(\frac{\partial y}{\partial\xi}\right)^2+\left(\frac{\partial z}{\partial\xi}\right)^2$$

$$h_\eta^2=\left(\frac{\partial x}{\partial\eta}\right)^2+\left(\frac{\partial y}{\partial\eta}\right)^2+\left(\frac{\partial z}{\partial\eta}\right)^2$$

$$h_\phi^2=\left(\frac{\partial x}{\partial\phi}\right)^2+\left(\frac{\partial y}{\partial\phi}\right)^2+\left(\frac{\partial z}{\partial\phi}\right)^2$$

**Metric Coefficients for Prolate Spheroidal Coordinates**

**21.4.2**

$$h_\xi=f\sqrt{\frac{\xi^2-\eta^2}{\xi^2-1}};\ h_\eta=f\sqrt{\frac{\xi^2-\eta^2}{1-\eta^2}};\ h_\phi=f\sqrt{(\xi^2-1)(1-\eta^2)}$$ *

**Metric Coefficients for Oblate Spheroidal Coordinates**

**21.4.3**

$$h_\xi=f\sqrt{\frac{\xi^2-\eta^2}{\xi^2-1}};\ h_\eta=f\sqrt{\frac{\xi^2-\eta^2}{1-\eta^2}};\ h_\phi=f\xi\eta$$ *

### 21.5. Wave Equation in Prolate and Oblate Spheroidal Coordinates

**Wave Equation in Prolate Spheroidal Coordinates**

**21.5.1**

$$\nabla^2\Phi+k^2\Phi=\frac{\partial}{\partial\xi}\left[(\xi^2-1)\frac{\partial\Phi}{\partial\xi}\right]+\frac{\partial}{\partial\eta}\left[(1-\eta^2)\frac{\partial\Phi}{\partial\eta}\right]$$
$$+\frac{\xi^2-\eta^2}{(\xi^2-1)(1-\eta^2)}\frac{\partial^2\Phi}{\partial\phi^2}+c^2(\xi^2-\eta^2)\Phi=0$$

$$\left(c=\frac{1}{2}fk\right)$$

---

*See page II.

#### Wave Equation in Oblate Spheroidal Coordinates

**21.5.2**

$$\nabla^2\Phi+k^2\Phi=\frac{\partial}{\partial\xi}\left[(\xi^2+1)\frac{\partial\Phi}{\partial\xi}\right]+\frac{\partial}{\partial\eta}\left[(1-\eta^2)\frac{\partial\Phi}{\partial\eta}\right]$$
$$+\frac{\xi^2+\eta^2}{(\xi^2+1)(1-\eta^2)}\frac{\partial^2\Phi}{\partial\phi^2}+c^2(\xi^2+\eta^2)\Phi=0$$
$$\left(c=\frac{1}{2}fk\right)$$

**21.5.2** may be obtained from **21.5.1** by the transformations

$$\xi\to\pm i\xi,\ c\to\mp ic.$$

## 21.6. Differential Equations for Radial and Angular Prolate Spheroidal Wave Functions

If in **21.5.1** we put

$$\Phi=R_{mn}(c,\xi)S_{mn}(c,\eta)\begin{matrix}\cos\\ \sin\end{matrix}m\phi$$

then the "radial solution" $R_{mn}(c,\xi)$ and the "angular solution" $S_{mn}(c,\eta)$ satisfy the differential equations

**21.6.1**

$$\frac{d}{d\xi}\left[(\xi^2-1)\frac{d}{d\xi}R_{mn}(c,\xi)\right]$$
$$-\left(\lambda_{mn}-c^2\xi^2+\frac{m^2}{\xi^2-1}\right)R_{mn}(c,\xi)=0$$

**21.6.2**

$$\frac{d}{d\eta}\left[(1-\eta^2)\frac{d}{d\eta}S_{mn}(c,\eta)\right]$$
$$+\left(\lambda_{mn}-c^2\eta^2-\frac{m^2}{1-\eta^2}\right)S_{mn}(c,\eta)=0$$

where the separation constants (or eigenvalues) $\lambda_{mn}$ are to be determined so that $R_{mn}(c,\xi)$ and $S_{mn}(c,\eta)$ are finite at $\xi=\pm1$ and $\eta=\pm1$ respectively.

(**21.6.1** and **21.6.2** are identical. Radial and angular prolate spheroidal functions satisfy the same differential equation over different ranges of the variable.)

#### Differential Equations for Radial and Angular Oblate Spheroidal Functions

**21.6.3**

$$\frac{d}{d\xi}\left[(\xi^2+1)\frac{d}{d\xi}R_{mn}(c,\xi)\right]$$
$$-\left(\lambda_{mn}-c^2\xi^2-\frac{m^2}{\xi^2+1}\right)R_{mn}(c,\xi)=0$$

**21.6.4**

$$\frac{d}{d\eta}\left[(1-\eta^2)\frac{d}{d\eta}S_{mn}(c,\eta)\right]$$
$$+\left(\lambda_{mn}+c^2\eta^2-\frac{m^2}{1-\eta^2}\right)S_{mn}(c,\eta)=0$$

(**21.6.3** may be obtained from **21.6.1** by the transformations $\xi\to\pm i\xi$, $c\to\mp ic$; **21.6.4** may be obtained from **21.6.2** by the transformation $c\to\mp ic$.)

## 21.7. Prolate Angular Functions

**21.7.1**

$$S^{(1)}_{mn}(c,\eta)=\sum_{r=0,1}^{\infty}{}' d^{mn}_r(c)P^m_{m+r}(\eta)$$

=Prolate angular function of the first kind

**21.7.2**

$$S^{(2)}_{mn}(c,\eta)=\sum_{r=-\infty}^{\infty}{}' d^{mn}_r(c)Q^m_{m+r}(\eta)$$

=Prolate angular function of the second kind

($P^m_n(\eta)$ and $Q^m_n(\eta)$ are associated Legendre functions of the first and second kinds respectively. However, for $-1\leq z\leq1$, $P^m_n(z)=(1-z^2)^{m/2}d^mP_n(z)/dz^m$ (see **8.6.6**). The summation is extended over even values or odd values of $r$.)

#### Recurrence Relations Between the Coefficients

**21.7.3**

$$\alpha_kd_{k+2}+(\beta_k-\lambda_{mn})d_k+\gamma_kd_{k-2}=0$$

$$\alpha_k=\frac{(2m+k+2)(2m+k+1)c^2}{(2m+2k+3)(2m+2k+5)}$$

$$\beta_k=(m+k)(m+k+1)$$
$$+\frac{2(m+k)(m+k+1)-2m^2-1}{(2m+2k-1)(2m+2k+3)}c^2$$

$$\gamma_k=\frac{k(k-1)c^2}{(2m+2k-3)(2m+2k-1)}$$

#### Transcendental Equation for $\lambda_{mn}$

**21.7.4**

$$U(\lambda_{mn})=U_1(\lambda_{mn})+U_2(\lambda_{mn})=0$$

$$U_1(\lambda_{mn})=\gamma^m_r-\lambda_{mn}-\frac{\beta^m_r}{\gamma^m_{r-2}-\lambda_{mn}-}\ \frac{\beta^m_{r-2}}{\gamma^m_{r-4}-\lambda_{mn}-}\cdots$$

$$U_2(\lambda_{mn})=-\frac{\beta^m_{r+2}}{\gamma^m_{r+2}-\lambda_{mn}-}\ \frac{\beta^m_{r+4}}{\gamma^m_{r+4}-\lambda_{mn}-}\cdots$$

$$\beta^m_k=\frac{k(k-1)(2m+k)(2m+k-1)c^4}{(2m+2k-1)^2(2m+2k+1)(2m+2k-3)}\qquad(k\geq2)$$

$$\gamma^m_k=(m+k)(m+k+1)$$
$$+\tfrac{1}{2}c^2\left[1-\frac{4m^2-1}{(2m+2k-1)(2m+2k+3)}\right]\ (k\geq0)$$

(The choice of $r$ in **21.7.4** is arbitrary.)

### Power Series Expansion for $\lambda_{mn}$

**21.7.5**

$$\lambda_{mn}=\sum_{k=0}^{\infty} l_{2k}c^{2k}$$

$$l_0=n(n+1)$$

$$l_2=\tfrac{1}{2}\left[1-\frac{(2m-1)(2m+1)}{(2n-1)(2n+3)}\right]$$

$$l_4=\frac{-(n-m+1)(n-m+2)(n+m+1)(n+m+2)}{2(2n+1)(2n+3)^3(2n+5)}+\frac{(n-m-1)(n-m)(n+m-1)(n+m)}{2(2n-3)(2n-1)^3(2n+1)}$$

$$l_6=(4m^2-1)\left[\frac{(n-m+1)(n-m+2)(n+m+1)(n+m+2)}{(2n-1)(2n+1)(2n+3)^5(2n+5)(2n+7)}-\frac{(n-m-1)(n-m)(n+m-1)(n+m)}{(2n-5)(2n-3)(2n-1)^5(2n+1)(2n+3)}\right]$$

$$l_8=2(4m^2-1)^2A+\frac{1}{16}B+\frac{1}{8}C+\frac{1}{2}D$$

$$A=\frac{(n-m-1)(n-m)(n+m-1)(n+m)}{(2n-5)^2(2n-3)(2n-1)^7(2n+1)(2n+3)^2}-\frac{(n-m+1)(n-m+2)(n+m+1)(n+m+2)}{(2n-1)^2(2n+1)(2n+3)^7(2n+5)(2n+7)^2}$$

$$B=\frac{(n-m-3)(n-m-2)(n-m-1)(n-m)(n+m-3)(n+m-2)(n+m-1)(n+m)}{(2n-7)(2n-5)^2(2n-3)^3(2n-1)^4(2n+1)}$$
$$-\frac{(n-m+1)(n-m+2)(n-m+3)(n-m+4)(n+m+1)(n+m+2)(n+m+3)(n+m+4)}{(2n+1)(2n+3)^4(2n+5)^3(2n+7)^2(2n+9)}$$

$$C=\frac{(n-m+1)^2(n-m+2)^2(n+m+1)^2(n+m+2)^2}{(2n+1)^2(2n+3)^7(2n+5)^2}-\frac{(n-m-1)^2(n-m)^2(n+m-1)^2(n+m)^2}{(2n-3)^2(2n-1)^7(2n+1)^2}$$

$$D=\frac{(n-m-1)(n-m)(n-m+1)(n-m+2)(n+m-1)(n+m)(n+m+1)(n+m+2)}{(2n-3)(2n-1)^4(2n+1)^2(2n+3)^4(2n+5)}$$

### Asymptotic Expansion for $\lambda_{mn}$

**21.7.6**

$$\lambda_{mn}(c)=cq+m^2-\frac{1}{8}(q^2+5)-\frac{q}{64c}(q^2+11-32m^2)$$
$$-\frac{1}{1024c^2}[5(q^4+26q^2+21)-384m^2(q^2+1)]$$
$$-\frac{1}{c^3}\left[\frac{1}{128^2}(33q^5+1594q^3+5621q)-\frac{m^2}{128}(37q^3+167q)+\frac{m^4}{8}q\right]$$
$$-\frac{1}{c^4}\left[\frac{1}{256^2}(63q^6+4940q^4+43327q^2+22470)-\frac{m^2}{512}(115q^4+1310q^2+735)+\frac{3m^4}{8}(q^2+1)\right]$$
$$-\frac{1}{c^5}\left[\frac{1}{1024^2}(527q^7+61529q^5+1043961q^3+2241599q)-\frac{m^2}{32\cdot 1024}(5739q^5+127550q^3+298951q)+\frac{m^4}{512}(355q^3+1505q)-\frac{m^6q}{16}\right]+O(c^{-6})$$

$$q=2(n-m)+1$$

### Refinement of Approximate Values of $\lambda_{mn}$

If $\lambda_{mn}^{(1)}$ is an approximation to $\lambda_{mn}$ obtained either from **21.7.5** or **21.7.6** then

**21.7.7**

$$\lambda_{mn}=\lambda_{mn}^{(1)}+\delta\lambda_{mn}$$

$$\delta\lambda_{mn}=\frac{U_1(\lambda_{mn}^{(1)})+U_2(\lambda_{mn}^{(1)})}{\Delta_1+\Delta_2}$$

$$\Delta_1=1+\frac{\beta_r^m}{(N_r^m)^2}+\frac{\beta_r^m\beta_{r-2}^m}{(N_r^mN_{r-2}^m)^2}+\frac{\beta_r^m\beta_{r-2}^m\beta_{r-4}^m}{(N_r^mN_{r-2}^mN_{r-4}^m)^2}+\ldots$$

$$\Delta_2=\frac{(N_{r+2}^m)^2}{\beta_{r+2}^m}+\frac{(N_{r+2}^mN_{r+4}^m)^2}{\beta_{r+2}^m\beta_{r+4}^m}+\frac{(N_{r+2}^mN_{r+4}^mN_{r+6}^m)^2}{\beta_{r+2}^m\beta_{r+4}^m\beta_{r+6}^m}+\ldots$$

$$N_r^m=\frac{(2m+r)(2m+r-1)c^2}{(2m+2r-1)(2m+2r+1)}\frac{d_r}{d_{r-2}}\qquad(r\geq 2)$$

$$\beta_r^m=\frac{r(r-1)(2m+r)(2m+r-1)c^4}{(2m+2r-1)^2(2m+2r+1)(2m+2r-3)}\qquad(r\geq 2)$$

### Evaluation of Coefficients

Step 1. Calculate $N_r^m$'s from

**21.7.8**

$$N^m_{r+2}=\gamma^m_r-\lambda_{mn}-\frac{\beta^m_r}{N^m_r}\qquad (r\geq 2)$$

$$N^m_2=\gamma^m_0-\lambda_{mn};\ N^m_3=\gamma^m_1-\lambda_{mn}$$

$$\gamma^m_r=(m+r)(m+r+1)$$

$$+\frac{1}{2}c^2\left[1-\frac{4m^2-1}{(2m+2r-1)(2m+2r+3)}\right]\ (r\geq 0)$$

Step 2. Calculate ratios $\frac{d_0}{d_{2r}}$ and $\frac{d_1}{d_{2p+1}}$ from

**21.7.9** $$\frac{d_0}{d_{2r}}=\left(\frac{d_0}{d_2}\right)\left(\frac{d_2}{d_4}\right)\cdots\left(\frac{d_{2r-2}}{d_{2r}}\right)$$

**21.7.10** $$\frac{d_1}{d_{2p+1}}=\left(\frac{d_1}{d_3}\right)\left(\frac{d_3}{d_5}\right)\cdots\left(\frac{d_{2p-1}}{d_{2p+1}}\right)$$

and the formula for $N_r^m$ in **21.7.7.**

The coefficients $d_r^{mn}$ are determined to within the arbitrary factor $d_0$ for $r$ even and $d_1$ for $r$ odd. The choice of these factors depends on the normalization scheme adopted.

### Normalization of Angular Functions

#### Meixner-Schäfke Scheme

**21.7.11** $$\int_{-1}^{1}[S_{mn}(c,\eta)]^2d\eta=\frac{2}{2n+1}\,\frac{(n+m)!}{(n-m)!}$$

#### Stratton-Morse-Chu-Little-Corbató Scheme

**21.7.12** $$\sum_{r=0,1}^{}{}' \frac{(r+2m)!}{r!}\,d_r=\frac{(n+m)!}{(n-m)!}$$

(This normalization has the effect that $S_{mn}(c,\eta)\to P_n^m(\eta)$ as $\eta\to 1$.)

#### Flammer Scheme [21.4]

**21.7.13**

$$S_{mn}(c,0)=P^m_n(0)=\frac{(-1)^{\frac{n-m}{2}}(n+m)!}{2^n\left(\frac{n-m}{2}\right)!\left(\frac{n+m}{2}\right)!}$$

$(n-m)$ even

**21.7.14**

$$S'_{mn}(c,0)=P^{m\prime}_n(0)=\frac{(-1)^{\frac{n-m-1}{2}}(n+m+1)!}{2^n\left(\frac{n-m-1}{2}\right)!\left(\frac{n+m+1}{2}\right)!}$$

$(n-m)$ odd

The above lead to the following conditions for $d_r^{mn}$

**21.7.15**

$$\sum_{r=0}^{\infty}{}'\frac{(-1)^{r/2}(r+2m)!}{2^r\left(\frac{r}{2}\right)!\left(\frac{r+2m}{2}\right)!}\,d^{mn}_r=\frac{(-1)^{\frac{n-m}{2}}(n+m)!}{2^{n-m}\left(\frac{n-m}{2}\right)!\left(\frac{n+m}{2}\right)!}$$

$(n-m)$ even

**21.7.16**

$$\sum_{r=1}^{\infty}{}'\frac{(-1)^{\frac{r-1}{2}}(r+2m+1)!}{2^r\left(\frac{r-1}{2}\right)!\left(\frac{r+2m+1}{2}\right)!}\,d^{mn}_r$$

$$=\frac{(-1)^{\frac{n-m-1}{2}}(n+m+1)!}{2^{n-m}\left(\frac{n-m-1}{2}\right)!\left(\frac{n+m+1}{2}\right)!}\qquad (n-m)\text{ odd}$$

(The normalization scheme **21.7.13** and **21.7.14** is also used in [21.10].)

### Asymptotic Expansions for $S_{mn}(c,\eta)$

**21.7.17**

$$S_{mn}(c,\eta)=(1-\eta^2)^{\frac{1}{2}}U_{mn}(c,\eta)\qquad (c\to\infty)$$

$$U_{mn}(x)=\sum_{r=-\infty}^{\infty}h^l_rD_{l+r}(x)\qquad l=n-m$$

where the $D_r(x)$'s are the parabolic cylinder functions (see chapter **19**).

$$D_r(x)=(-1)^re^{x^2/4}\frac{d^2}{dx^2}e^{-x^2/2}=2^{-r/2}e^{-x^2/4}H_r\left(\frac{x}{\sqrt{2}}\right)$$

and the $H_r(x)$ are the Hermite polynomials (see chapter **22**). (For tables of $h^l_{\pm r}/h^l_0$ see [21.4].)

### Expansion of $S_{mn}(c,\eta)$ in Powers of $\eta$

**21.7.18**

$$S_{mn}(c,\eta)=(1-\eta^2)^{m/2}\sum_{r=0,1}^{\infty}{}'p^{mn}_r(c)\eta^r$$

$$(r+1)(r+2)p^{mn}_{r+2}(c)-[r(r+2m+1)+m(m+1)$$

$$-\lambda_{mn}(c)]p^{mn}_r(c)-c^2p^{mn}_{r-2}(c)=0$$

(The derivation of the transcendental equation for $\lambda_{mn}$ is similar to the derivation of **21.7.4** from **21.7.3.**)

### Expansion of $S_{mn}(c,\eta)$ in Powers of $(1-\eta^2)$

**21.7.19**

$$S_{mn}(c,\eta)=(1-\eta^2)^{m/2}\sum_{k=0}^{\infty}c^{mn}_{2k}(1-\eta^2)^k\qquad (n-m)\text{ even}$$

**21.7.20**

$$S_{mn}(c,\eta)=\eta(1-\eta^2)^{m/2}\sum_{k=0}^{\infty}c_{2k}^{mn}(1-\eta^2)^k \qquad (n-m)\text{ odd}$$

$$c_{2k}^{mn}=\frac{1}{2^m k!(m+k)!}\sum_{r=k}^{\infty}\frac{(2m+2r)!}{(2r)!}(-r)_k\left(m+r+\frac{1}{2}\right)_k d_{2r}^{mn}$$

$$(n-m)\text{ even}$$

$$c_{2k}^{mn}=$$

$$\frac{1}{2^m k!(m+k)!}\sum_{r=k}^{\infty}\frac{(2m+2r+1)!}{(2r+1)!}(-r)_k\left(m+r+\frac{3}{2}\right)_k d_{2r+1}^{mn}$$

$$(n-m)\text{ odd}$$

$$(\alpha)_k=\alpha(\alpha+1)(\alpha+2)\ .\ .\ .\ (\alpha+k+1)$$

(The $d_r^{mn}$'s are the coefficients in **21.7.1.**)

### Prolate Angular Functions—Second Kind

Expansion **21.7.2** ultimately leads to

**21.7.21**

$$S_{mn}^{(2)}(c,\eta)=\sum_{r=-2m,\ -2m+1}^{\infty}{}' d_r^{mn}Q_{m+r}^m(\eta)$$

$$+\sum_{r=2m+2,\ 2m+1}^{\infty}{}' d_{\rho|r}^{mn}P_{r-m-1}^m(\eta)$$

(The coefficients $d_r^{mn}$ are the same as in **21.7.1**; the coefficients $d_{\rho|r}^{mn}$ are tabulated in [21.4].)

## 21.8. Oblate Angular Functions

### Power Series Expansion for Eigenvalues

**21.8.1** $$\lambda_{mn}=\sum_{k=0}^{\infty}(-1)^k l_{2k}c^{2k}$$

where the $l_k$'s are the same as in **21.7.5.**

### Asymptotic Expansion for Eigenvalues [21.4]

**21.8.2**

$$\lambda_{mn}=-c^2+2c(2\nu+m+1)-2\nu(\nu+m+1)$$
$$-(m+1)+\Lambda_{mn}$$

$\nu=\frac{1}{2}(n-m)$ for $(n-m)$ even;

$\nu=\frac{1}{2}(n-m-1)$ for $(n-m)$ odd

$$\Lambda_{mn}=\sum_{k=1}^{\infty}\beta_k^{mn}c^{-k}$$

$$\beta_1^{mn}=-2^{-3}q(q^2+1-m^2)$$

$$\beta_2^{mn}=-2^{-6}[5q^4+10q^2+1-2m^2(3q^2+1)+m^4]$$

$$\beta_3^{mn}=-2^{-9}q[33q^4+114q^2+37-2m^2(23q^2+25)$$
$$+13m^4]$$

$$\beta_4^{mn}=-2^{-10}[63q^6+340q^4+239q^2+14$$
$$-10m^2(10q^4+23q^2+3)+m^4(39q^2-18)-2m^6]$$

$$\beta_k^{mn}=\nu(\nu+m)a_k^{-1}+(\nu+1)(\nu+m+1)a_k^{+1}$$

$q=n+1$ for $(n-m)$ even; $q=n$ for $(n-m)$ odd

(For the definition of $a_k^{\pm r}$ see **21.8.3.**)

### Asymptotic Expansion for Oblate Angular Functions

**21.8.3**

$$S_{mn}(-ic,\eta)\sim(1-\eta^2)^{m/2}\sum_{s=-\nu}^{\infty}A_s^{mn}\{e^{-c(1-\eta)}L_{\nu+s}^{(m)}[2c(1-\eta)]$$
$$+(-1)^{n-m}e^{-c(1+\eta)}L_{\nu+s}^{(m)}[2c(1+\eta)]\}$$

where the $L_\nu^{(m)}(x)$ are Laguerre polynomials (see chapter 22) and

$$\frac{A_{\pm r}^{mn}}{A_0^{mn}}=\sum_{k=r}^{\infty}a_k^{\pm r}(m,n)c^{-k}$$

(Expressions of $a_k{}^{\pm r}$ are given in [21.4].)

## 21.9. Radial Spheroidal Wave Functions

**21.9.1**

$$R_{mn}^{(p)}(c,\xi)=\left\{\sum_{r=0,\ 1}^{\infty}{}'\frac{(2m+r)!}{r!}d_r^{mn}\right\}^{-1}\left(\frac{\xi^2-1}{\xi^2}\right)^{m/2}$$
$$\cdot\sum_{r=0,\ 1}^{\infty}{}' i^{r+m-n}\frac{(2m+r)!}{r!}d_r^{mn}Z_{m+r}^{(p)}(c\xi)^{*}$$

$$Z_n^{(p)}(z)=\sqrt{\frac{\pi}{2z}}J_{n+\frac{1}{2}}(z) \qquad (p=1)$$

$$=\sqrt{\frac{\pi}{2z}}Y_{n+\frac{1}{2}}(z) \qquad (p=2)$$

($J_{n+\frac{1}{2}}(z)$ and $Y_{n+\frac{1}{2}}(z)$ are Bessel functions, order $n+\frac{1}{2}$, of the first and second kind respectively (see chapter **10**).)

**21.9.2** $$R_{mn}^{(3)}(c,\xi)=R_{mn}^{(1)}(c,\xi)+iR_{mn}^{(2)}(c,\xi)$$

**21.9.3** $$R_{mn}^{(4)}(c,\xi)=R_{mn}^{(1)}(c,\xi)-iR_{mn}^{(2)}(c,\xi)$$

### Asymptotic Behavior of $R_{mn}^{(1)}(c,\xi)$ and $R_{mn}^{(2)}(c,\xi)$

**21.9.4** $$R_{mn}^{(1)}(c,\xi)\xrightarrow[c\xi\to\infty]{}\frac{1}{c\xi}\cos\left[c\xi-\tfrac{1}{2}(n+1)\pi\right]$$

**21.9.5** $$R_{mn}^{(2)}(c,\xi)\xrightarrow[c\xi\to\infty]{}\frac{1}{c\xi}\sin\left[c\xi-\tfrac{1}{2}(n+1)\pi\right]$$

---

*See page II.

## 21.10. Joining Factors for Prolate Spheroidal Wave Functions

**21.10.1**

$$S_{mn}^{(1)}(c,\xi)=\kappa_{mn}^{(1)}(c)R_{mn}^{(1)}(c,\xi)$$

$$\kappa_{mn}^{(1)}(c)=\frac{(2m+1)(n+m)!\sum\limits_{r=0}^{\infty}{}' d_r^{mn}(2m+r)!/r!}{2^{n+m}d_0^{mn}(c)c^m m!\left(\frac{n-m}{2}\right)!\left(\frac{n+m}{2}\right)!} \qquad (n-m) \text{ even}$$

$$=\frac{(2m+3)(n+m+1)!\sum\limits_{r=1}^{\infty}{}' d_r^{mn}(2m+r)!/r!}{2^{n+m}d_1^{mn}(c)c^{m+1}m!\left(\frac{n-m-1}{2}\right)!\left(\frac{n+m+1}{2}\right)!} \qquad (n-m) \text{ odd}$$

**21.10.2**

$$S_{mn}^{(2)}(c,\xi)=\kappa_{mn}^{(2)}(c)R_{mn}^{(2)}(c,\xi)$$

$$\kappa_{mn}^{(2)}(c)=\frac{2^{n-m}(2m)!\left(\frac{n-m}{2}\right)!\left(\frac{n+m}{2}\right)!\,d_{-2m}^{mn}(c)}{(2m-1)m!(n+m)!c^{m-1}}\sum_{r=0}^{\infty}{}'\frac{(2m+r)!}{r!}d_r^{mn}(c) \qquad (n-m) \text{ even}$$

$$=-\frac{2^{n-m}(2m)!\left(\frac{n-m-1}{2}\right)!\left(\frac{n+m+1}{2}\right)!\,d_{-2m+1}^{mn}(c)}{(2m-3)(2m-1)m!(n+m+1)!\,c^{m-2}}\sum_{r=1}^{\infty}{}'\frac{(2m+r)!}{r!}d_r^{mn}(c) \qquad (n-m) \text{ odd}$$

(The expression for joining factors appropriate to the oblate case may be obtained from the above formulas by the transformation $c\rightarrow -ic$.)

## 21.11. Notation

# 22. Orthogonal Polynomials

## Mathematical Properties

### 22.1. Definition of Orthogonal Polynomials

A system of polynomials $f_n(x)$, degree $[f_n(x)]=n$, is called orthogonal on the interval $a \leq x \leq b$, with respect to the weight function $w(x)$, if

**22.1.1**

$$\int_a^b w(x) f_n(x) f_m(x) dx = 0 \qquad (n \neq m; n, m = 0, 1, 2, \ldots)$$

The weight function $w(x)[w(x) \geq 0]$ determines the system $f_n(x)$ up to a constant factor in each polynomial. The specification of these factors is referred to as standardization. For suitably standardized orthogonal polynomials we set

**22.1.2**

$$\int_a^b w(x) f_n^2(x) dx = h_n, f_n(x) = k_n x^n + k'_n x^{n-1} + \ldots \qquad (n = 0, 1, 2, \ldots)$$

These polynomials satisfy a number of relationships of the same general form. The most important ones are:

**Differential Equation**

**22.1.3** $$g_2(x) f''_n + g_1(x) f'_n + a_n f_n = 0$$

where $g_2(x)$, $g_1(x)$ are independent of $n$ and $a_n$ a constant depending only on $n$.

**Recurrence Relation**

**22.1.4** $$f_{n+1} = (a_n + x b_n) f_n - c_n f_{n-1}$$

where

**22.1.5**

$$b_n = \frac{k_{n+1}}{k_n}, \quad a_n = b_n \left( \frac{k'_{n+1}}{k_{n+1}} - \frac{k'_n}{k_n} \right), \quad c_n = \frac{k_{n+1} k_{n-1} h_n}{k_n^2 h_{n-1}}$$

**Rodrigues' Formula**

**22.1.6** $$f_n = \frac{1}{e_n w(x)} \frac{d^n}{dx_n} \{ w(x) [g(x)]^n \}$$

where $g(x)$ is a polynomial in $x$ independent of $n$. The system $\left\{ \frac{df_n}{dx} \right\}$ consists again of orthogonal polynomials.

## 22.5. Interrelations

### Interrelations Between Orthogonal Polynomials of the Same Family

### Jacobi Polynomials

**22.5.1**

$$P_n^{(\alpha,\beta)}(x)=\frac{\Gamma(2n+\alpha+\beta+1)}{n!\,\Gamma(n+\alpha+\beta+1)}G_n\left(\alpha+\beta+1,\beta+1,\frac{x+1}{2}\right)$$

**22.5.2**

$$G_n(p,q,x)=\frac{n!\,\Gamma(n+p)}{\Gamma(2n+p)}P_n^{(p-q,q-1)}(2x-1)$$

(see [22.21]).

**22.5.3**

$$F_n(p,q,x)=(-1)^n n!\,\frac{\Gamma(q)}{\Gamma(q+n)}P_n^{(p-q,q-1)}(2x-1)$$

(see [22.13]).

### Ultraspherical Polynomials

**22.5.4** $$C_n^{(0)}(x)=\lim_{\alpha\to 0}\frac{1}{\alpha}C_n^{(\alpha)}(x)$$

### Chebyshev Polynomials

**22.5.5** $$T_n(x)=\tfrac{1}{2}C_n(2x)=T_n^*\left(\frac{1+x}{2}\right)$$

**22.5.6** $$T_n(x)=U_n(x)-xU_{n-1}(x)$$

---

*See page II.

**22.5.7** $T_n(x)=xU_{n-1}(x)-U_{n-2}(x)$

**22.5.8** $T_n(x)=\frac{1}{2}\left[U_n(x)-U_{n-2}(x)\right]$

**22.5.9** $U_n(x)=S_n(2x)=U_n^*\left(\frac{1+x}{2}\right)$

**22.5.10** $U_{n-1}(x)=\frac{1}{1-x^2}\left[xT_n(x)-T_{n+1}(x)\right]$

**22.5.11** $C_n(x)=2T_n\left(\frac{x}{2}\right)=2T_n^*\left(\frac{x+2}{4}\right)$

**22.5.12** $C_n(x)=S_n(x)-S_{n-2}(x)$

**22.5.13** $S_n(x)=U_n\left(\frac{x}{2}\right)=U_n^*\left(\frac{x+2}{4}\right)$

**22.5.14** $T_n^*(x)=T_n(2x-1)=\frac{1}{2}\,C_n(4x-2)$

(see [22.22]).

**22.5.15** $U_n^*(x)=S_n(4x-2)=U_n(2x-1)$

(see [22.22]).

### Generalized Laguerre Polynomials

**22.5.16** $L_n^{(0)}(x)=L_n(x)$

**22.5.17** $L_n^{(m)}(x)=(-1)^m\frac{d^m}{dx^m}\left[L_{n+m}(x)\right]$

### Hermite Polynomials

**22.5.18** $He_n(x)=2^{-n/2}H_n\left(\frac{x}{\sqrt{2}}\right)$

(see [22.20]).

**22.5.19** $H_n(x)=2^{n/2}He_n(x\sqrt{2})$

(see [22.13], [22.20]).

## Interrelations Between Orthogonal Polynomials of Different Families

### Jacobi Polynomials

**22.5.20**

$$P_n^{(\alpha-\frac{1}{2},\alpha-\frac{1}{2})}(x)=\frac{\Gamma(2\alpha)\Gamma(\alpha+n+\frac{1}{2})}{\Gamma(2\alpha+n)\Gamma(\alpha+\frac{1}{2})}\,C_n^{(\alpha)}(x)$$

**22.5.21**

$$P_n^{(\alpha,\frac{1}{2})}(x)=\frac{(\frac{1}{2})_{n+1}}{\sqrt{\frac{x+1}{2}}\,(\alpha+\frac{1}{2})_{n+1}}\,C_{2n+1}^{(\alpha+\frac{1}{2})}\left(\sqrt{\frac{x+1}{2}}\right)$$

**22.5.22** $P_n^{(\alpha,-\frac{1}{2})}(x)=\frac{(\frac{1}{2})_n}{(\alpha+\frac{1}{2})_n}\,C_{2n}^{(\alpha+\frac{1}{2})}\left(\sqrt{\frac{x+1}{2}}\right)$

**22.5.23** $P_n^{(-\frac{1}{2},-\frac{1}{2})}(x)=\frac{1}{4^n}\binom{2n}{n}T_n(x)$

**22.5.24** $P_n^{(0,0)}(x)=P_n(x)$

### Ultraspherical Polynomials

**22.5.25**

$$C_{2n}^{(\alpha)}(x)=\frac{\Gamma(\alpha+n)n!2^{2n}}{\Gamma(\alpha)(2n)!}\,P_n^{(\alpha-\frac{1}{2},-\frac{1}{2})}\,(2x^2-1) \qquad (\alpha\neq 0)$$

**22.5.26**

$$C_{2n+1}^{(\alpha)}(x)=\frac{\Gamma(\alpha+n+1)n!2^{2n+1}}{\Gamma(\alpha)(2n+1)!}\,xP_n^{(\alpha-\frac{1}{2},\frac{1}{2})}(2x^2-1) \qquad (\alpha\neq 0)$$

**22.5.27**

$$C_n^{(\alpha)}(x)=\frac{\Gamma(\alpha+\frac{1}{2})\Gamma(2\alpha+n)}{\Gamma(2\alpha)\Gamma(\alpha+n+\frac{1}{2})}\,P_n^{(\alpha-\frac{1}{2},\alpha-\frac{1}{2})}(x) \qquad (\alpha\neq 0)$$

**22.5.28**

$$C_n^{(0)}(x)=\frac{2}{n}T_n(x)=2\,\frac{(n-1)!}{\Gamma(n+\frac{1}{2})}\sqrt{\pi}P_n^{(-\frac{1}{2},-\frac{1}{2})}(x)$$ *

### Chebyshev Polynomials

**22.5.29** $T_{2n+1}(x)=\frac{n!\sqrt{\pi}}{\Gamma(n+\frac{1}{2})}\,xP_n^{(-\frac{1}{2},\frac{1}{2})}(2x^2-1)$

**22.5.30** $U_{2n}(x)=\frac{n!\sqrt{\pi}}{\Gamma(n+\frac{1}{2})}\,P_n^{(\frac{1}{2},-\frac{1}{2})}(2x^2-1)$

**22.5.31** $T_n(x)=\frac{n!\sqrt{\pi}}{\Gamma(n+\frac{1}{2})}\,P_n^{(-\frac{1}{2},-\frac{1}{2})}(x)$

**22.5.32** $U_n(x)=\frac{(n+1)!\sqrt{\pi}}{2\Gamma(n+\frac{3}{2})}\,P_n^{(\frac{1}{2},\frac{1}{2})}(x)$

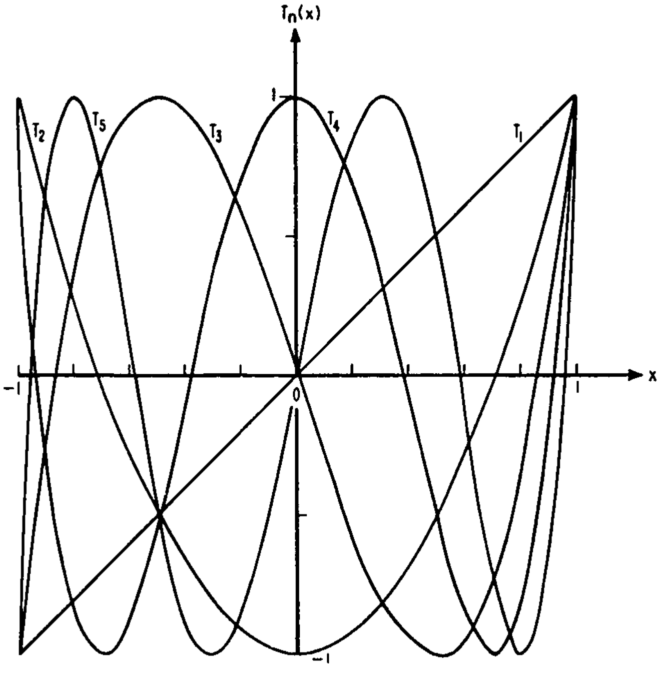

FIGURE 22.6. *Chebyshev Polynomials* $T_n(x)$, $n=1(1)5$.

---

*See page II.

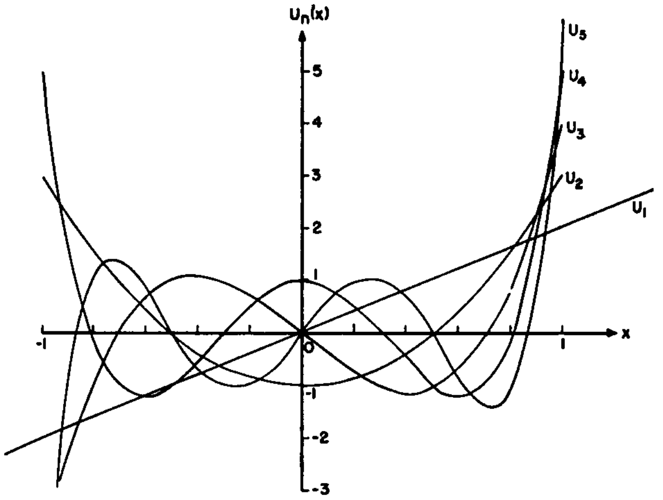

FIGURE 22.7. *Chebyshev Polynomials* $U_n(x)$, $n=1(1)5$.

**22.5.33** $$T_n(x)=\frac{n}{2}C_n^{(0)}(x)$$

**22.5.34** $$U_n(x)=C_n^{(1)}(x)$$

### Legendre Polynomials

**22.5.35** $$P_n(x)=P_n^{(0,0)}(x)$$

**22.5.36** $$P_n(x)=C_n^{(1/2)}(x)$$

**22.5.37**

$$\frac{d^m}{dx^m}[P_n(x)]=1\cdot 3\ldots(2m-1)C_{n-m}^{(m+\frac{1}{2})}(x) \qquad (m\leq n)$$

### Generalized Laguerre Polynomials

**22.5.38** $$L_n^{(-1/2)}(x)=\frac{(-1)^n}{n!2^{2n}}H_{2n}(\sqrt{x})$$

**22.5.39** $$L_n^{(1/2)}(x)=\frac{(-1)^n}{n!2^{2n+1}\sqrt{x}}H_{2n+1}(\sqrt{x})$$

### Hermite Polynomials

**22.5.40** $$H_{2m}(x)=(-1)^m 2^{2m} m!L_m^{(-1/2)}(x^2)$$

**22.5.41** $$H_{2m+1}(x)=(-1)^m 2^{2m+1} m!xL_m^{(1/2)}(x^2)$$

### Orthogonal Polynomials as Hypergeometric Functions (see chapter 15)

$$f_n(x)=dF(a, b; c; g(x))$$

For each of the listed polynomials there are numerous other representations in terms of hypergeometric functions.

| | $f_n(x)$ | $d$ | $a$ | $b$ | $c$ | $g(x)$ |
|---|---|---|---|---|---|---|
| **22.5.42** | $P_n^{(\alpha,\beta)}(x)$ | $\binom{n+\alpha}{n}$ | $-n$ | $n+\alpha+\beta+1$ | $\alpha+1$ | $\frac{1-x}{2}$ |
| **22.5.43** | $P_n^{(\alpha,\beta)}(x)$ | $\binom{2n+\alpha+\beta}{n}\left(\frac{x-1}{2}\right)^n$ | $-n$ | $-n-\alpha$ | $-2n-\alpha-\beta$ | $\frac{2}{1-x}$ |
| **22.5.44** | $P_n^{(\alpha,\beta)}(x)$ | $\binom{n+\alpha}{n}\left(\frac{1+x}{2}\right)^n$ | $-n$ | $-n-\beta$ | $\alpha+1$ | $\frac{x-1}{x+1}$ |
| **22.5.45** | $P_n^{(\alpha,\beta)}(x)$ | $\binom{n+\beta}{n}\left(\frac{x-1}{2}\right)^n$ | $-n$ | $-n-\alpha$ | $\beta+1$ | $\frac{x+1}{x-1}$ |
| **22.5.46** | $C_n^{(\alpha)}(x)$ | $\frac{\Gamma(n+2\alpha)}{n!\Gamma(2\alpha)}$ | $-n$ | $n+2\alpha$ | $\alpha+\frac{1}{2}$ | $\frac{1-x}{2}$ |
| **22.5.47** | $T_n(x)$ | $1$ | $-n$ | $n$ | $\frac{1}{2}$ | $\frac{1-x}{2}$ |
| **22.5.48** | $U_n(x)$ | $n+1$ | $-n$ | $n+2$ * | $\frac{3}{2}$ | $\frac{1-x}{2}$ |
| **22.5.49** | $P_n(x)$ | $1$ | $-n$ | $n+1$ | $1$ | $\frac{1-x}{2}$ |
| **22.5.50** | $P_n(x)$ | $\binom{2n}{n}\left(\frac{x-1}{2}\right)^n$ | $-n$ | $-n$ | $-2n$ | $\frac{2}{1-x}$ |
| **22.5.51** | $P_n(x)$ | $\binom{2n}{n}\left(\frac{x}{2}\right)^n$ | $-\frac{n}{2}$ | $\frac{1-n}{2}$ | $\frac{1}{2}-n$ | $\frac{1}{x^2}$ |
| **22.5.52** | $P_{2n}(x)$ | $(-1)^n\frac{(2n)!}{2^{2n}(n!)^2}$ | $-n$ | $n+\frac{1}{2}$ | $\frac{1}{2}$ | $x^2$ |
| **22.5.53** | $P_{2n+1}(x)$ | $(-1)^n\frac{(2n+1)!}{2^{2n}(n!)^2}x$ | $-n$ | $n+\frac{3}{2}$ | $\frac{3}{2}$ | $x^2$ |

---

*See page II.

### Orthogonal Polynomials as Confluent Hypergeometric Functions (see chapter 13)

**22.5.54** $L_n^{(\alpha)}(x)=\binom{n+\alpha}{n}M(-n,\alpha+1,x)$

### Orthogonal Polynomials as Parabolic Cylinder Functions (see chapter 19)

**22.5.55** $H_n(x)=2^nU\left(\frac{1}{2}-\frac{1}{2}n,\frac{3}{2},x^2\right)$

**22.5.56** $H_{2m}(x)=(-1)^m\frac{(2m)!}{m!}M\left(-m,\frac{1}{2},x^2\right)$

**22.5.57**

* $H_{2m+1}(x)=(-1)^m\frac{(2m+1)!}{m!}2xM\left(-m,\frac{3}{2},x^2\right)$

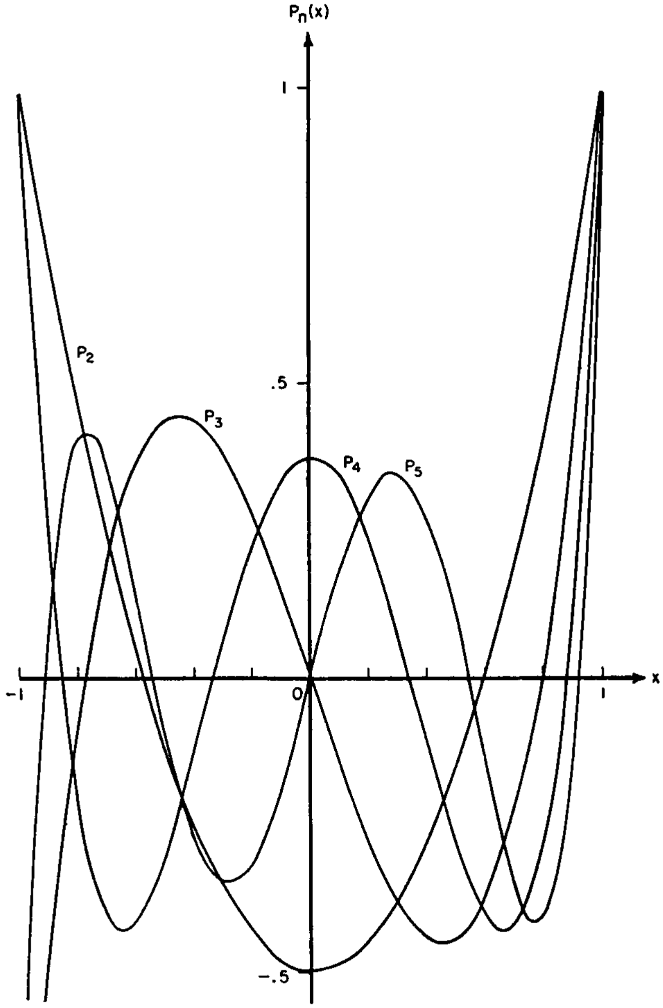

FIGURE 22.8. *Legendre Polynomials* $P_n(x)$, $n=2(1)5$.

**22.5.58**

$$H_n(x)=2^{n/2}e^{x^2/2}D_n(\sqrt{2}x)=2^{n/2}e^{x^2/2}U\left(-n-\frac{1}{2},\sqrt{2}x\right)$$

**22.5.59** $He_n(x)=e^{x^2/4}D_n(x)=e^{x^2/4}U\left(-n-\frac{1}{2},x\right)$

### Orthogonal Polynomials as Legendre Functions (see chapter 8)

**22.5.60**

$C_n^{(\alpha)}(x)=$

$$\frac{\Gamma(\alpha+\frac{1}{2})\Gamma(2\alpha+n)}{n!\Gamma(2\alpha)}\left[\frac{1}{4}(x^2-1)\right]^{\frac{1}{4}-\frac{\alpha}{2}}P^{(\frac{1}{2}-\alpha)}_{n+\alpha-\frac{1}{2}}(x)$$

$(\alpha\neq0)$

| 22.7.10 | $P_n(x)$ | $n+1$ | $0$ | $2n+1$ | $n$ |
| 22.7.11 | $P_n^*(x)$ | $n+1$ | $-2n-1$ | $4n+2$ | $n$ |
| 22.7.12 | $L_n^{(\alpha)}(x)$ | $n+1$ | $2n+\alpha+1$ | $-1$ | $n+\alpha$ |
| 22.7.13 | $H_n(x)$ | $1$ | $0$ | $2$ | $2n$ |
| 22.7.14 | $He_n(x)$ | $1$ | $0$ | $1$ | $n$ |

### Miscellaneous Recurrence Relations

#### Jacobi Polynomials

**22.7.15**

$$\left(n+\frac{\alpha}{2}+\frac{\beta}{2}+1\right)(1-x)P_n^{(\alpha+1,\beta)}(x)=(n+\alpha+1)P_n^{(\alpha,\beta)}(x)-(n+1)P_{n+1}^{(\alpha,\beta)}(x)$$

**22.7.16**

$$\left(n+\frac{\alpha}{2}+\frac{\beta}{2}+1\right)(1+x)P_n^{(\alpha,\beta+1)}(x)=(n+\beta+1)P_n^{(\alpha,\beta)}(x)+(n+1)P_{n+1}^{(\alpha,\beta)}(x)$$

**22.7.17**

$$(1-x)P_n^{(\alpha+1,\beta)}(x)+(1+x)P_n^{(\alpha,\beta+1)}(x)=2P_n^{(\alpha,\beta)}(x)$$

**22.7.18**

$$(2n+\alpha+\beta)P_n^{(\alpha-1,\beta)}(x)=(n+\alpha+\beta)P_n^{(\alpha,\beta)}(x)-(n+\beta)P_{n-1}^{(\alpha,\beta)}(x)$$

**22.7.19**

$$(2n+\alpha+\beta)P_n^{(\alpha,\beta-1)}(x)=(n+\alpha+\beta)P_n^{(\alpha,\beta)}(x)+(n+\alpha)P_{n-1}^{(\alpha,\beta)}(x)$$

**22.7.20** $P_n^{(\alpha,\beta-1)}(x)-P_n^{(\alpha-1,\beta)}(x)=P_{n-1}^{(\alpha,\beta)}(x)$

#### Ultraspherical Polynomials

**22.7.21**

$$2\alpha(1-x^2)C_{n-1}^{(\alpha+1)}(x)=(2\alpha+n-1)C_{n-1}^{(\alpha)}(x)-nxC_n^{(\alpha)}(x)$$

**22.7.22**

$$=(n+2\alpha)xC_n^{(\alpha)}(x)-(n+1)C_{n+1}^{(\alpha)}(x)$$

**22.7.23** $(n+\alpha)C_{n+1}^{(\alpha-1)}(x)=(\alpha-1)[C_{n+1}^{(\alpha)}(x)-C_{n-1}^{(\alpha)}(x)]$

#### Chebyshev Polynomials

**22.7.24**

$$2T_m(x)T_n(x)=T_{n+m}(x)+T_{n-m}(x)\qquad(n\geq m)\qquad *$$

**22.7.25**

$$2(x^2-1)U_{m-1}(x)U_{n-1}(x)=T_{n+m}(x)-T_{n-m}(x)\qquad(n\geq m)$$

**22.7.26**

$$2T_m(x)U_{n-1}(x)=U_{n+m-1}(x)+U_{n-m-1}(x)\qquad(n>m)$$

**22.7.27**

$$2T_n(x)U_{m-1}(x)=U_{n+m-1}(x)-U_{n-m-1}(x)\qquad(n>m)$$

**22.7.28** $2T_n(x)U_{n-1}(x)=U_{2n-1}(x)$

---

*See page II.

### Generalized Laguerre Polynomials

**22.7.29**

$$L_n^{(\alpha+1)}(x)=\frac{1}{x}\left[(x-n)L_n^{(\alpha)}(x)+(\alpha+n)L_{n-1}^{(\alpha)}(x)\right]$$

**22.7.30** $$L_n^{(\alpha-1)}(x)=L_n^{(\alpha)}(x)-L_{n-1}^{(\alpha)}(x)$$

**22.7.31**

$$L_n^{(\alpha+1)}(x)=\frac{1}{x}\left[(n+\alpha+1)L_n^{(\alpha)}(x)-(n+1)L_{n+1}^{(\alpha)}(x)\right]$$

**22.7.32**

$$L_n^{(\alpha-1)}(x)=\frac{1}{n+\alpha}\left[(n+1)L_{n+1}^{(\alpha)}(x)-(n+1-x)L_n^{(\alpha)}(x)\right]$$

## 22.8. Differential Relations

$$g_2(x)\frac{d}{dx}f_n(x)=g_1(x)f_n(x)+g_0(x)f_{n-1}(x)$$

| | $f_n$ | $g_2$ | $g_1$ | $g_0$ |
|---|---|---|---|---|
| **22.8.1** | $P_n^{(\alpha,\beta)}(x)$ | $(2n+\alpha+\beta)(1-x^2)$ | $n[\alpha-\beta-(2n+\alpha+\beta)x]$ | $2(n+\alpha)(n+\beta)$ |
| **22.8.2** | $C_n^{(\alpha)}(x)$ | $1-x^2$ | $-nx$ | $n+2\alpha-1$ |
| **22.8.3** | $T_n(x)$ | $1-x^2$ | $-nx$ | $n$ |
| **22.8.4** | $U_n(x)$ | $1-x^2$ | $-nx$ | $n+1$ |
| **22.8.5** | $P_n(x)$ | $1-x^2$ | $-nx$ | $n$ |
| **22.8.6** | $L_n^{(\alpha)}(x)$ | $x$ | $n$ | $-(n+\alpha)$ |
| **22.8.7** | $H_n(x)$ | $1$ | $0$ | $2n$ |
| **22.8.8** | $He_n(x)$ | $1$ | $0$ | $n$ |

## 22.9. Generating Functions

$$g(x,z)=\sum_{n=0}^{\infty}a_nf_n(x)z^n \qquad R=\sqrt{1-2xz+z^2}$$

| | $f_n(x)$ | $a_n$ | $g(x,z)$ | Remarks |
|---|---|---|---|---|
| **22.9.1** | $P_n^{(\alpha,\beta)}(x)$ | $2^{-\alpha-\beta}$ | $R^{-1}(1-z+R)^{-\alpha}(1+z+R)^{-\beta}$ | $\lvert z\rvert<1$ |
| **22.9.2** | $C_n^{(\alpha)}(x)$ | $\frac{2^{\frac{1}{2}-\alpha}\Gamma(\alpha+\frac{1}{2}+n)\Gamma(2\alpha)}{\Gamma(\alpha+\frac{1}{2})\Gamma(2\alpha+n)}$ | $R^{-1}(1-xz+R)^{\frac{1}{2}-\alpha}$ | $\lvert z\rvert<1, \alpha\neq 0$ |
| **22.9.3** | $C_n^{(\alpha)}(x)$ | $1$ | $R^{-2\alpha}$ | $\lvert z\rvert<1, \alpha\neq 0$ |
| **22.9.4** | $C_n^{(0)}(x)$ | $1$ | $-\ln R^2$ | $\lvert z\rvert<1$ |
| **22.9.5** | $C_n^{(\alpha)}(x)$ | $\frac{\Gamma(2\alpha)}{\Gamma(\alpha+\frac{1}{2})\Gamma(2\alpha+n)}$ | $e^{z\cos\theta}\left(\frac{z}{2}\sin\theta\right)^{\frac{1}{2}-\alpha}J_{\alpha-\frac{1}{2}}(z\sin\theta)$ | $x=\cos\theta$ |
| **22.9.6** | $T_n(x)$ | $2$ | $\left(\frac{1-z^2}{R^2}+1\right)$ | $-1<x<1$<br>$\lvert z\rvert<1$ |
| **22.9.7** | $T_n(x)$ | $\frac{\sqrt{2}}{4^n}\binom{2n}{n}$ | $R^{-1}(1-xz+R)^{1/2}$ | $-1<x<1$<br>$\lvert z\rvert<1$ |
| **22.9.8** | $T_n(x)$ | $\frac{1}{n}$ | $1-\frac{1}{2}\ln R^2$ | $a_0=1$<br>$-1<x<1$<br>$\lvert z\rvert<1$ |
| **22.9.9** | $T_n(x)$ | $1$ | $\frac{1-xz}{R^2}$ | $-1<x<1$<br>$\lvert z\rvert<1$ |
| **22.9.10** | $U_n(x)$ | $1$ | $R^{-2}$ | $-1<x<1$<br>$\lvert z\rvert<1$ |

| **22.9.16** | $L_n^{(\alpha)}(x)$ | $\frac{1}{\Gamma(n+\alpha+1)}$ | $(xz)^{-\frac{1}{2}\alpha}e^zJ_\alpha[2(xz)^{1/2}]$ | |
| **22.9.17** | $H_n(x)$ | $\frac{1}{n!}$ | $e^{2xz-z^2}$ | |
| **22.9.18** | $H_{2n}(x)$ | $\frac{(-1)^n}{(2n)!}$ | $e^z\cos(2x\sqrt{z})$ * | |
| **22.9.19** | $H_{2n+1}(x)$ | $\frac{(-1)^n}{(2n+1)!}$ | $z^{-1/2}e^z\sin(2x\sqrt{z})$ * | |

## 22.10. Integral Representations

### Contour Integral Representations

$f_n(x)=\frac{g_0(x)}{2\pi i}\int_C [g_1(z,x)]^n g_2(z,x)dz$ where $C$ is a closed contour taken around $z=a$ in the positive sense

| | $f_n(x)$ | $g_0(x)$ | $g_1(z,x)$ | $g_2(z,x)$ | $a$ | Remarks |
|---|---|---|---|---|---|---|
| **22.10.1** | $P_n^{(\alpha,\beta)}(x)$ | $\frac{1}{(1-x)^\alpha(1+x)^\beta}$ | $\frac{z^2-1}{2(z-x)}$ | $\frac{(1-z)^\alpha(1+z)^\beta}{z-x}$ | $x$ | $\pm 1$ outside $C$ |
| **22.10.2** | $C_n^{(\alpha)}(x)$ | $1$ | $1/z$ | $(1-2xz+z^2)^{-\alpha}z^{-1}$ | $0$ | Both zeros of $1-2xz+z^2$ outside $C$, $\alpha>0$ |
| **22.10.3** | $T_n(x)$ | $1/2$ | $1/z$ | $\frac{1-z^2}{z(1-2xz+z^2)}$ | $0$ | Both zeros of $1-2xz+z^2$ outside $C$ |
| **22.10.4** | $U_n(x)$ | $1$ | $1/z$ | $\frac{1}{z(1-2xz+z^2)}$ | $0$ | Both zeros of $1-2xz+z^2$ outside $C$ |
| **22.10.5** | $P_n(x)$ | $1$ | $1/z$ | $\frac{1}{z}(1-2xz+z^2)^{-1/2}$ | $0$ | Both zeros of $1-2xz+z^2$ outside $C$ |
| **22.10.6** | $P_n(x)$ | $\frac{1}{2^n}$ | $\frac{z^2-1}{z-x}$ | $\frac{1}{z-x}$ | $x$ | |
| **22.10.7** | $L_n^{(\alpha)}(x)$ | $e^xx^{-\alpha}$ | $\frac{z}{z-x}$ | $\frac{z^\alpha}{z-x}e^{-z}$ | $x$ | Zero outside $C$ |
| **22.10.8** | $L_n^{(\alpha)}(x)$ | $1$ | $1+\frac{x}{z}$ | $e^{-z}\left(1+\frac{z}{x}\right)^\alpha 1/z$ | $0$ | $z=-x$ outside $C$ |
| **22.10.9** | $H_n(x)$ | $n!$ | $1/z$ | $\frac{e^{2xz-z^2}}{z}$ | $0$ | |

### Miscellaneous Integral Representations

**22.10.10** $$C_n^{(\alpha)}(x)=\frac{2^{(1-2\alpha)}\Gamma(n+2\alpha)}{n![\Gamma(\alpha)]^2}\int_0^\pi [x+\sqrt{x^2-1}\cos\phi]^n(\sin\phi)^{2\alpha-1}d\phi \qquad (\alpha>0)$$

**22.10.11** $$C_n^{(\alpha)}(\cos\theta)=\frac{2^{1-\alpha}\Gamma(n+2\alpha)}{n![\Gamma(\alpha)]^2}(\sin\theta)^{1-2\alpha}\int_0^\theta \frac{\cos(n+\alpha)\phi}{(\cos\phi-\cos\theta)^{1-\alpha}}d\phi \qquad (\alpha>0)$$

---

*See page II.

**22.10.12** $$P_n(\cos\theta)=\frac{1}{\pi}\int_0^\pi(\cos\theta+i\sin\theta\cos\phi)^n d\phi$$

**22.10.13** $$P_n(\cos\theta)=\frac{\sqrt{2}}{\pi}\int_\theta^\pi\frac{\sin(n+\frac{1}{2})\phi d\phi}{(\cos\theta-\cos\phi)^{\frac{1}{2}}}$$

**22.10.14** $$L_n^{(\alpha)}(x)=\frac{e^x x^{-\frac{\alpha}{2}}}{n!}\int_0^\infty e^{-t}t^{n+\frac{\alpha}{2}}J_\alpha(2\sqrt{tx})dt$$

**22.10.15**

$$H_n(x)=e^{x^2}\frac{2^{n+1}}{\sqrt{\pi}}\int_0^\infty e^{-t^2}t^n\cos\left(2xt-\frac{n}{2}\pi\right)dt$$

## 22.11. Rodrigues' Formula

$$f_n(x)=\frac{1}{a_n\rho(x)}\frac{d^n}{dx^n}\{\rho(x)(g(x))^n\}$$

The polynomials given in the following table are the only orthogonal polynomials which satisfy this formula.

| | $f_n(x)$ | $a_n$ | $\rho(x)$ | $g(x)$ |
|---|---|---|---|---|
| **22.11.1** | $P_n^{(\alpha,\beta)}(x)$ | $(-1)^n 2^n n!$ | $(1-x)^\alpha(1+x)^\beta$ | $1-x^2$ |
| **22.11.2** | $C_n^{(\alpha)}(x)$ | $(-1)^n 2^n n!\,\frac{\Gamma(2\alpha)\Gamma(\alpha+n+\frac{1}{2})}{\Gamma(\alpha+\frac{1}{2})\Gamma(n+2\alpha)}$ | $(1-x^2)^{\alpha-\frac{1}{2}}$ | $1-x^2$ |
| **22.11.3** | $T_n(x)$ | $(-1)^n 2^n\,\frac{\Gamma(n+\frac{1}{2})}{\sqrt{\pi}}$ * | $(1-x^2)^{-\frac{1}{2}}$ | $1-x^2$ |
| **22.11.4** | $U_n(x)$ | $(-1)^n 2^{n+1}\,\frac{\Gamma(n+\frac{3}{2})}{(n+1)\sqrt{\pi}}$ | $(1-x^2)^{\frac{1}{2}}$ | $1-x^2$ |
| **22.11.5** | $P_n(x)$ | $(-1)^n 2^n n!$ | $1$ | $1-x^2$ |
| **22.11.6** | $L_n^{(\alpha)}(x)$ | $n!$ | $e^{-x}x^\alpha$ | $x$ |
| **22.11.7** | $H_n(x)$ | $(-1)^n$ | $e^{-x^2}$ | $1$ |
| **22.11.8** | $He_n(x)$ | $(-1)^n$ | $e^{-x^2/2}$ | $1$ |

## 22.12. Sum Formulas

### Christoffel-Darboux Formula

**22.12.1**

$$\sum_{m=0}^n\frac{1}{h_m}f_m(x)f_m(y)=\frac{k_n}{k_{n+1}h_n}\,\frac{f_{n+1}(x)f_n(y)-f_n(x)f_{n+1}(y)}{x-y}$$

### Miscellaneous Sum Formulas (Only a Limited Selection Is Given Here.)

**22.12.2** $$\sum_{m=0}^n T_{2m}(x)=\tfrac{1}{2}[1+U_{2n}(x)]$$

**22.12.3** $$\sum_{m=0}^{n-1}T_{2m+1}(x)=\tfrac{1}{2}U_{2n-1}(x)$$

**22.12.4** $$\sum_{m=0}^n U_{2m}(x)=\frac{1-T_{2n+2}(x)}{2(1-x^2)}$$

**22.12.5** $$\sum_{m=0}^{n-1}U_{2m+1}(x)=\frac{x-T_{2n+1}(x)}{2(1-x^2)}$$

**22.12.6** $$\sum_{m=0}^n L_m^{(\alpha)}(x)L_{n-m}^{(\beta)}(y)=L_n^{(\alpha+\beta+1)}(x+y)$$

**22.12.7** $$\sum_{m=0}^n\binom{n+\alpha}{m}\mu^{n-m}(1-\mu)^m L_{n-m}^{(\alpha)}(x)=L_n^{(\alpha)}(\mu x)$$

**22.12.8**

$$H_n(x+y)=\frac{1}{2^{n/2}}\sum_{k=0}^n\binom{n}{k}H_k(\sqrt{2}x)H_{n-k}(\sqrt{2}y)$$

## 22.13. Integrals Involving Orthogonal Polynomials

**22.13.1**

$$2n\int_0^x(1-y)^\alpha(1+y)^\beta P_n^{(\alpha,\beta)}(y)dy$$
$$=P_{n-1}^{(\alpha+1,\beta+1)}(0)-(1-x)^{\alpha+1}(1+x)^{\beta+1}P_{n-1}^{(\alpha+1,\beta+1)}(x)$$

**22.13.2**

$$\frac{n(2\alpha+n)}{2\alpha}\int_0^x(1-y^2)^{\alpha-\frac{1}{2}}C_n^{(\alpha)}(y)dy$$
$$=C_{n-1}^{(\alpha+1)}(0)-(1-x^2)^{\alpha+\frac{1}{2}}C_{n-1}^{(\alpha+1)}(x)$$

**22.13.3** $$-\!\!\!\!\!\!\int_{-1}^1\frac{T_n(y)dy}{(y-x)\sqrt{1-y^2}}=\pi U_{n-1}(x)$$

**22.13.4** $$-\!\!\!\!\!\!\int_{-1}^1\frac{\sqrt{1-y^2}U_{n-1}(y)dy}{(y-x)}=-\pi T_n(x)$$ *

**22.13.5** $$\int_{-1}^1(1-x)^{-1/2}P_n(x)dx=\frac{2^{3/2}}{2n+1}$$ *

**22.13.6** $$\int_0^\pi P_{2n}(\cos\theta)d\theta=\frac{\pi}{16^n}\binom{2n}{n}^2$$

**22.13.7** $$\int_0^\pi P_{2n+1}(\cos\theta)\cos\theta d\theta=\frac{\pi}{4^{2n+1}}\binom{2n}{n}\binom{2n+2}{n+1}$$

---

*See page II.

**22.13.8**

$$\int_0^1 x^\lambda P_{2n}(x)dx = \frac{(-1)^n \Gamma\left(n-\frac{\lambda}{2}\right)\Gamma\left(\frac{1}{2}+\frac{\lambda}{2}\right)}{2\Gamma\left(-\frac{\lambda}{2}\right)\Gamma\left(n+\frac{3}{2}+\frac{\lambda}{2}\right)} \quad (\lambda>-1)$$

**22.13.9**

$$\int_0^1 x^\lambda P_{2n+1}(x)dx = \frac{(-1)^n \Gamma\left(n+\frac{1}{2}-\frac{\lambda}{2}\right)\Gamma\left(1+\frac{\lambda}{2}\right)}{2\Gamma\left(n+2+\frac{\lambda}{2}\right)\Gamma\left(\frac{1}{2}-\frac{\lambda}{2}\right)} \quad (\lambda>-2)$$

**22.13.10**

$$\int_{-1}^x \frac{P_n(t)dt}{\sqrt{x-t}} = \frac{1}{(n+\frac{1}{2})\sqrt{1+x}}\left[T_n(x)+T_{n+1}(x)\right]$$

**22.13.11**

$$\int_x^1 \frac{P_n(t)dt}{\sqrt{t-x}} = \frac{1}{(n+\frac{1}{2})\sqrt{1-x}}\left[T_n(x)-T_{n+1}(x)\right]$$

**22.13.12** $$\int_x^\infty e^{-t}L_n^{(\alpha)}(t)dt = e^{-x}\left[L_n^{(\alpha)}(x)-L_{n-1}^{(\alpha)}(x)\right]$$

**22.13.13**

$$\Gamma(\alpha+\beta+n+1)\int_0^x (x-t)^{\beta-1}t^\alpha L_n^{(\alpha)}(t)dt = \Gamma(\alpha+n+1)\Gamma(\beta)x^{\alpha+\beta}L_n^{(\alpha+\beta)}(x) \quad (\mathscr{R}\alpha>-1,\ \mathscr{R}\beta>0)$$

**22.13.14**

$$\int_0^x L_m(t)L_n(x-t)dt = \int_0^x L_{m+n}(t)dt = L_{m+n}(x)-L_{m+n+1}(x)$$

**22.13.15** $$\int_0^x e^{-t^2}H_n(t)dt = H_{n-1}(0)-e^{-x^2}H_{n-1}(x)$$

**22.13.16** $$\int_0^x H_n(t)dt = \frac{1}{2(n+1)}\left[H_{n+1}(x)-H_{n+1}(0)\right]$$

**22.13.17** $$\int_{-\infty}^\infty e^{-t^2}H_{2m}(tx)dt = \sqrt{\pi}\,\frac{(2m)!}{m!}\,(x^2-1)^m$$

**22.13.18**

$$\int_{-\infty}^\infty e^{-t^2}tH_{2m+1}(tx)dt = \sqrt{\pi}\,\frac{(2m+1)!}{m!}\,x(x^2-1)^m$$

**22.13.19** $$\int_{-\infty}^\infty e^{-t^2}t^nH_n(xt)dt = \sqrt{\pi}n!P_n(x)$$

**22.13.20**

$$\int_0^\infty e^{-t^2}[H_n(t)]^2 \cos(xt)dt = \sqrt{\pi}2^{n-1}n!e^{-\frac{1}{4}x^2}L_n\left(\frac{x^2}{2}\right)$$

## 22.14. Inequalities

**22.14.1**

$$|P_n^{(\alpha,\beta)}(x)| \leqq \begin{cases} \binom{n+q}{n} \approx n^q, \text{ if } q=\max(\alpha,\beta)\geq -1/2 \\ \qquad\qquad (\alpha>-1,\ \beta>-1) \\ |P_n^{(\alpha,\beta)}(x')| \approx \sqrt{\frac{1}{n}}, \text{ if } q<-\frac{1}{2} \end{cases}$$

$x'$ maximum point nearest to $\frac{\beta-\alpha}{\alpha+\beta+1}$

**22.14.2**

$$|C_n^{(\alpha)}(x)| \leq \begin{cases} \binom{n+2\alpha-1}{n} & (\alpha>0) \\ |C_n^{(\alpha)}(x')| & \left(-\frac{1}{2}<\alpha<0\right) \end{cases}$$

$x'=0$ if $n=2m$; $x'$=maximum point nearest zero if $n=2m+1$

**22.14.3**

$$|C_n^{(\alpha)}(\cos\theta)| < 2^{1-\alpha}\,\frac{n^{\alpha-1}}{(\sin\theta)^\alpha\Gamma(\alpha)} \quad (0<\alpha<1,\ 0<\theta<\pi)$$

**22.14.4** $|T_n(x)|\leq 1 \qquad (-1\leq x\leq 1)$

**22.14.5** $\left|\frac{dT_n(x)}{dx}\right|\leq n^2 \qquad (-1\leq x\leq 1)$

**22.14.6** $|U_n(x)|\leq n+1 \qquad (-1\leq x\leq 1)$

**22.14.7** $|P_n(x)|\leq 1 \qquad (-1\leq x\leq 1)$

**22.14.8** $\left|\frac{dP_n(x)}{dx}\right|\leq \frac{1}{2}n(n+1) \qquad (-1\leq x\leq 1)$

**22.14.9** $|P_n(x)|\leq \sqrt{\frac{2}{\pi n}}\,\frac{1}{\sqrt[4]{1-x^2}} \qquad (-1<x\leq 1)$*

**22.14.10**

$$P_n^2(x)-P_{n-1}(x)P_{n+1}(x) < \frac{2n+1}{3n(n+1)} \qquad (-1\leq x\leq 1)$$

**22.14.11**

$$P_n^2(x)-P_{n-1}(x)P_{n+1}(x) \geq \frac{1-P_n^2(x)}{(2n-1)(n+1)} \qquad (-1\leq x\leq 1)$$

**22.14.12** $|L_n(x)|\leq e^{x/2} \qquad (x\geq 0)$

**22.14.13** $|L_n^{(\alpha)}(x)|\leq \frac{\Gamma(\alpha+n+1)}{n!\Gamma(\alpha+1)}\,e^{x/2} \qquad (\alpha\geq 0,\ x\geq 0)$

**22.14.14**

$$|L_n^{(\alpha)}(x)| \leq \left[2-\frac{\Gamma(\alpha+n+1)}{n!\Gamma(\alpha+1)}\right]e^{x/2} \qquad (-1<\alpha<0,\ x\geq 0)$$

---

*See page II.

**22.14.15** $|H_{2m}(x)|\leq e^{x^2/2}2^{2m}m!\left[2-\frac{1}{2^{2m}}\binom{2m}{m}\right]$

**22.14.16** $|H_{2m+1}(x)|\leq xe^{x^2/2}\frac{(2m+2)!}{(m+1)!}\qquad(x\geq 0)$

**22.14.17** $|H_n(x)|<e^{x^2/2}k2^{n/2}\sqrt{n!}\qquad k\approx 1.086435$

## 22.15. Limit Relations

**22.15.1**

$$\lim_{n\to\infty}\left[\frac{1}{n^\alpha}P_n^{(\alpha,\beta)}\left(\cos\frac{x}{n}\right)\right]$$

$$=\lim_{n\to\infty}\frac{1}{n^\alpha}P_n^{(\alpha,\beta)}\left(1-\frac{x^2}{2n^2}\right)=\left(\frac{2}{x}\right)^\alpha J_\alpha(x)$$

**22.15.2** $\lim_{n\to\infty}\left[\frac{1}{n^\alpha}L_n^{(\alpha)}\left(\frac{x}{n}\right)\right]=x^{-\alpha/2}J_\alpha(2\sqrt{x})$

**22.15.3** $\lim_{n\to\infty}\left[\frac{(-1)^n\sqrt{n}}{4^n n!}H_{2n}\left(\frac{x}{2\sqrt{n}}\right)\right]=\frac{1}{\sqrt{\pi}}\cos x$

**22.15.4** $\lim_{n\to\infty}\left[\frac{(-1)^n}{4^n n!}H_{2n+1}\left(\frac{x}{2\sqrt{n}}\right)\right]=\frac{2}{\sqrt{\pi}}\sin x$

**22.15.5** $\lim_{\beta\to\infty}P_n^{(\alpha,\beta)}\left(1-\frac{2x}{\beta}\right)=L_n^{(\alpha)}(x)$

**22.15.6** $\lim_{\alpha\to\infty}\frac{1}{\alpha^{n/2}}C_n^{(\alpha)}\left(\frac{x}{\sqrt{\alpha}}\right)=\frac{1}{n!}H_n(x)$

For asymptotic expansions, see [22.5] and [22.17].

## 22.16. Zeros

For tables of the zeros and associated weight factors necessary for the Gaussian-type quadrature formulas see chapter 25. All the zeros of the orthogonal polynomials are real, simple and located in the interior of the interval of orthogonality.

### Explicit and Asymptotic Formulas and Inequalities

*Notations:*

$x_m^{(n)}$ $m$th zero of $f_n(x)\ (x_1^{(n)}<x_2^{(n)}<\ldots<x_n^{(n)})$

$\theta_m^{(n)}=\arccos x_{n-m+1}^{(n)}\ (0<\theta_1^{(n)}<\theta_2^{(n)}<\ldots<\theta_n^{(n)}<\pi)$

$j_{\alpha,m}$, $m$th positive zero of the Bessel function $J_\alpha(x)$

$0<j_{\alpha,1}<j_{\alpha,2}<\ldots$

| | $f_n(x)$ | Relation |
|---|---|---|
| **22.16.1** | $P_n^{(\alpha,\beta)}(\cos\theta)$ | $\lim_{n\to\infty} n\theta_m^{(n)}=j_{\alpha,m}\qquad(\alpha>-1,\ \beta>-1)$ |
| **22.16.2** | $C_n^{(\alpha)}(x)$ | $x_m^{(n)}=1-\frac{j^2_{\alpha-\frac{1}{2},m}}{2n^2}\left[1-\frac{2\alpha}{n}+O\left(\frac{1}{n^2}\right)\right]$ |
| **22.16.3** | $C_n^{(\alpha)}(\cos\theta)$ | $\frac{(m+\alpha-1)\pi}{n+\alpha}\leq\theta_m^{(n)}\leq\frac{m\pi}{n+\alpha}\qquad(0\leq\alpha\leq 1)$ |
| **22.16.4** | $T_n(x)$ | $x_m^{(n)}=\cos\frac{2m-1}{2n}\pi$ |
| **22.16.5** | $U_n(x)$ | $x_m^{(n)}=\cos\frac{m}{n+1}\pi$ |
| **22.16.6** | $P_n(\cos\theta)$ | $\begin{cases}\frac{2m-1}{2n+1}\pi\leq\theta_m^{(n)}\leq\frac{2m}{2n+1}\pi\\ \theta_m^{(n)}=\frac{4m-1}{4n+2}\pi+\frac{1}{8n^2}\cot\frac{4m-1}{4n+2}\pi+O(n^{-3})\end{cases}$ |
| **22.16.7** | $P_n(x)$ | $\begin{cases}x_m^{(n)}=1-\frac{j^2_{0,m}}{2n^2}\left[1-\frac{1}{n}+O(n^{-2})\right]\\ x_m^{(n)}=1-\frac{4\xi_m^{(n)}}{2n+1+\xi_m^{(n)}};\ \xi_m^{(n)}=\frac{j^2_{0,m}}{4n+2}\left[1+\frac{j^2_{0,m-2}}{12(2n+1)^2}\right]+O\left(\frac{1}{n^5}\right)\end{cases}$ |
| **22.16.8** | $L_n^{(\alpha)}(x)$ | $\left.\begin{cases}x_m^{(n)}>\frac{j^2_{\alpha,m}}{4k_n}\\ x_m^{(n)}<\frac{k_m}{k_n}\left(2k_m+\sqrt{4k_m^2+\frac{1}{4}-\alpha^2}\right)\\ x_m^{(n)}=\frac{j^2_{\alpha,m}}{4k_n}\left(1+\frac{2(\alpha^2-1)+j^2_{\alpha,m}}{48k_n^2}\right)+O(n^{-5})\end{cases}\right\}\ k_\tau=\tau+\frac{\alpha+1}{2}$ |

For error estimates see [22.6].

## 22.17. Orthogonal Polynomials of a Discrete Variable

In this section some polynomials $f_n(x)$ are listed which are orthogonal with respect to the scalar product

**22.17.1** $$(f_n, f_m)=\sum_i w^*(x_i)f_n(x_i)f_m(x_i).$$

The $x_i$ are the integers in the interval $a \leq x_i \leq b$ and $w^*(x_i)$ is a positive function such that $\sum_i w^*(x_i)$ is finite. The constant factor which is still free in each polynomial when only the orthogonality condition is given is defined here by the explicit representation (which corresponds to the Rodrigues' formula)

**22.17.2** $$f_n(x)=\frac{1}{r_n w^*(x)}\Delta^n[w^*(x)g(x, n)]$$

where $g(x, n)=g(x)g(x-1)\ldots g(x-n+1)$ and $g(x)$ is a polynomial in $x$ independent of $n$.

| Name | $a$ | $b$ | $w^*(x)$ | $r_n$ | $g(x, n)$ | Remarks |
|---|---|---|---|---|---|---|
| Chebyshev | 0 | $N-1$ | 1 | $1/n!$ | $\binom{x}{n}\binom{x-N}{n}$ | |
| Krawtchouk | 0 | $N$ | $p^x q^{N-x}\binom{N}{x}$ | $(-1)^n n!$ | $\frac{q^n x!}{(x-n)!}$ | $p, q>0;$ $p+q=1$ |
| Charlier | 0 | $\infty$ | $\frac{e^{-a}a^x}{x!}$ | $(-1)^n\sqrt{a^n}n!$ | $\frac{x!}{(x-n)!}$ | $a>0$ |
| Meixner | 0 | $\infty$ | $\frac{c^x\Gamma(b+x)}{\Gamma(b)x!}$ | $c^n$ | $\frac{x!}{(x-n)!}$ | $b>0, 0<c<1$ |
| Hahn | 0 | $\infty$ | $\frac{\Gamma(b)\Gamma(c+x)\Gamma(d+x)}{x!\Gamma(b+x)\Gamma(c)\Gamma(d)}$ | $n!$ | $\frac{x!\Gamma(b+x)}{(x-n)!\Gamma(b+x-n)}$ | |

For a more complete list of the properties of these polynomials see [22.5] and [22.17].

# Numerical Methods

## 22.18. Use and Extension of the Tables

*Evaluation of an orthogonal polynomial for which the coefficients are given numerically.*

**Example 1.** Evaluate $L_6(1.5)$ and its first and second derivative using **Table 22.10** and the Horner scheme.

| | | | | | | |
|---|---|---|---|---|---|---|
| 1 | −36 | 450 | −2400 | 5400 | −4320 | 720 |
| $x=1.5$ | 1.5 | −51.75 | 597.375 | −2703.9375 | 4044.09375 | −413.859375 |
| 1 | −34.5 | 398.25 | −1802.625 | 2696.0625 | −275.90625 | 306.140625 |
| 1.5 | 1.5 | −49.5 | 523.125 | −1919.25 | 1165.21875 | $L_6=\frac{306.140625}{720}$ $=.42519\ 53$ |
| 1 | −33.0 | 348.75 | −1279.500 | 776.8125 | 889.3125 | |
| 1.5 | 1.5 | −47.25 | 452.250 | −1240.875 | | $L_6'=\frac{889.3125}{720}$ $=1.23515\ 625$ |
| 1 | −31.5 | 301.50 | −827.250 | −464.0625 | | $L_6''=2\frac{[-464.0625]}{720}$ $=-1.28906\ 25$ |

*Evaluation of an orthogonal polynomial using the explicit representation when the coefficients are not given numerically.*

If an isolated value of the orthogonal polynomial $f_n(x)$ is to be computed, use the proper explicit expression rewritten in the form

$$f_n(x)=d_n(x)a_0(x)$$

and generate $a_0(x)$ recursively, where

$$a_{m-1}(x)=1-\frac{b_m}{c_m}f(x)a_m(x) \qquad (m=n,\ n-1,\ .\ .\ .,\ 2,\ 1,\ a_n(x)=1).$$

The $d_n(x)$, $b_m$, $c_m$, $f(x)$ for the polynomials of this chapter are listed in the following table:

| $f_n(x)$ | $d_n(x)$ | $b_m$ | $c_m$ | $f(x)$ |
|---|---|---|---|---|
| $P_n^{(\alpha,\beta)}$ | $\binom{n+\alpha}{n}$ | $(n-m+1)(\alpha+\beta+n+m)$ | $2m(\alpha+m)$ | $1-x$ |
| $C_{2n}^{(\alpha)}$ | $(-1)^n\frac{(\alpha)_n}{n!}$ | $2(n-m+1)(\alpha+n+m-1)$ | $m(2m-1)$ | $x^2$ |
| $C_{2n+1}^{(\alpha)}$ | $(-1)^n\frac{(\alpha)_{n+1}}{n!}2x$ | $2(n-m+1)(\alpha+n+m)$ | $m(2m+1)$ | $x^2$ |
| $T_{2n}$ | $(-1)^n$ | $2(n-m+1)(n+m-1)$ | $m(2m-1)$ | $x^2$ |
| $T_{2n+1}$ | $(-1)^n(2n+1)x$ | $2(n-m+1)(n+m)$ | $m(2m+1)$ | $x^2$ |
| $U_{2n}$ | $(-1)^n$ | $2(n-m+1)(n+m)$ | $m(2m-1)$ | $x^2$ |
| $U_{2n+1}$ | $(-1)^n 2(n+1)x$ | $2(n-m+1)(n+m+1)$ | $m(2m+1)$ | $x^2$ |
| $P_{2n}$ | $\frac{(-1)^n}{4^n}\binom{2n}{n}$ | $(n-m+1)(2n+2m-1)$ | $m(2m-1)$ | $x^2$ |
| $P_{2n+1}$ | $\frac{(-1)^n}{4^n}\binom{2n+1}{n}(n+1)x$ | $(n-m+1)(2n+2m+1)$ | $m(2m+1)$ | $x^2$ |
| $L_n^{(\alpha)}$ | $\binom{n+\alpha}{n}$ | $n-m+1$ | $m(\alpha+m)$ | $x$ |
| $H_{2n}$ | $(-1)^n\frac{(2n)!}{n!}$ | $2(n-m+1)$ | $m(2m-1)$ | $x^2$ |
| $H_{2n+1}$ | $(-1)^n\frac{(2n+1)!}{n!}2x$ | $2(n-m+1)$ | $m(2m+1)$ | $x^2$ |

**Example 2.** Compute $P_8^{(1/2,3/2)}(2)$. Here $d_8=\binom{8.5}{8}=3.33847$, $f(2)=-1$.

| $m$ | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|
| $a_m$ | 1 | 1.132353 | 1.366667 | 1.841026 | 3.008392 | 6.849651 | 26.44156 | 223.1091 | 6545.533 |
| $b_m$ | 18 | 34 | 48 | 60 | 70 | 78 | 84 | 88 | 90 |
| $c_m$ | 136 | 105 | 78 | 55 | 36 | 21 | 10 | 3 | 0 |

$P_8^{(1/2,3/2)}(2)=d_8a_0(2)=(3.33847)(6545.533)=21852.07$

*Evaluation of orthogonal polynomials by means of their recurrence relations*

**Example 3.** Compute $C_n^{(\frac{1}{4})}(2.5)$ for $n=2,3,4,5,6$.

From **Table 22.2** $C_0^{(\frac{1}{4})}=1$, $C_1^{(\frac{1}{4})}=1.25$ and from **22.7** the recurrence relation is

$$C_{n+1}^{(\frac{1}{4})}(2.5)=[5(n+\tfrac{1}{4})C_n^{(\frac{1}{4})}(2.5)-(n-\tfrac{1}{2})C_{n-1}^{(\frac{1}{4})}(2.5)]\frac{1}{n+1}.$$

| $n$ | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|
| $C_n^{(\frac{1}{4})}(2.5)$ | 3.65625 | 13.08594 | 50.87648 | 207.0649 | 867.7516 |

Check: Compute $C_6^{(\frac{1}{4})}(2.5)$ by the method of **Example 2.**

### Change of Interval of Orthogonality

In some applications it is more convenient to use polynomials orthogonal on the interval [0, 1]. One can obtain the new polynomials from the ones given in this chapter by the substitution $x=2\bar{x}-1$. The coefficients of the new polynomial can be computed from the old by the following recursive scheme, provided the standardization is not changed. If

$$f_n(x)=\sum_{m=0}^{n} a_m x^m, \quad f_n^*(x)=f_n(2x-1)=\sum_{m=0}^{n} a_m^* x^m$$

then the $a_m^*$ are given recursively by the $a_m$ through the relations

$a_m^{(j)}=2a_m^{(j-1)}-a_{m+1}^{(j)};\ m=n-1,\ n-2,\ .\ .\ .,\ j;\ j=0,\ 1,\ 2,\ .\ .\ .,\ n$

$a_m^{(-1)}=a_m/2,\ m=0,\ 1,\ 2,\ .\ .\ .,\ n$

$a_n^{(j)}=2^j a_n,\ j=0,\ 1,\ 2,\ .\ .\ .,\ n$ and $a_m^{(m)}=a_m^*;\ m=0,\ 1,\ 2,\ .\ .\ .,\ n.$

**Example 4.** Given $T_5(x)=5x-20x^3+16x^5$, find $T_5^*(x)$.

| $m$<br>$j$ | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|
| $-1$ | $8=a_5^{(-1)}$ | 0 | $-10=a_3^{(-1)}$ | 0 | $2.5=a_1^{(-1)}$ | 0 |
| 0 | 16 | $-16$ | $-4$ | 4 | 1 | $-1=a_0^*$ |
| 1 | 32 | $-64$ | 56 | $-48$ | $50=a_1^*$ | |
| 2 | 64 | $-192$ | 304 | $-400=a_2^*$ | | |
| 3 | 128 | $-512$ | $1120=a_3^*$ | | | |
| 4 | 256 | $-1280=a_4^*$ | | | | |
| 5 | $512=a_5^*$ | | | | | |

Hence, $T_5^*(x)=512x^5-1280x^4+1120x^3-400x^2+50x-1$.

## 22.19. Least Square Approximations

*Problem:* Given a function $f(x)$ (analytically or in form of a table) in a domain $D$ (which may be a continuous interval or a set of discrete points).[2] Approximate $f(x)$ by a polynomial $F_n(x)$ of given degree $n$ such that a weighted sum of the squares of the errors in $D$ is least.

*Solution:* Let $w(x)\geq 0$ be the weight function chosen according to the relative importance of the errors in different parts of $D$. Let $f_m(x)$ be orthogonal polynomials in $D$ relative to $w(x)$, i.e. $(f_m, f_n)=0$ for $m\neq n$, where

$$(f,g)=\begin{cases} \displaystyle\int_D w(x)f(x)g(x)dx & \text{if } D \text{ is a continuous interval} \\ \displaystyle\sum_{m=1}^{N} w(x_m)f(x_m)g(x_m) & \text{if } D \text{ is a set of } N \text{ discrete points } x_m. \end{cases}$$

Then

$$F_n(x)=\sum_{m=0}^{n} a_m f_m(x)$$

where

* $$a_m=(f, f_m)/(f_m, f_m).$$

### $D$ a Continuous Interval

**Example 5.** Find a least square polynomial of degree 5 for $f(x)=\frac{1}{1+x}$, in the interval $2\leq x\leq 5$, using the weight function

$$w(x)=\frac{1}{\sqrt{(x-2)(5-x)}}$$

which stresses the importance of the errors at the ends of the interval.

Reduction to interval $[-1,1]$, $t=\frac{2x-7}{3}$

$$w(x(t))=\frac{2}{3}\frac{1}{\sqrt{1-t^2}}$$

From 22.2, $f_m(t)=T_m(t)$ and

$$a_m=\frac{4}{3\pi}\int_{-1}^{1}\frac{1}{\sqrt{1-t^2}}\frac{1}{t+3}T_m(t)dt \qquad (m\neq 0)$$

$$a_0=\frac{2}{3\pi}\int_{-1}^{1}\frac{1}{\sqrt{1-t^2}}\frac{dt}{t+3}$$

---

[2] $f(x)$ has to be square integrable, see e.g. [22.17].

---

*See page II.

Evaluating the integrals numerically we get

$$\frac{1}{1+x}\sim .235703-.080880T_1\left(\frac{2x-7}{3}\right)+.013876T_2\left(\frac{2x-7}{3}\right)-.002380T_3\left(\frac{2x-7}{3}\right)$$
$$+.000408T_4\left(\frac{2x-7}{3}\right)-.000070T_5\left(\frac{2x-7}{3}\right)$$

### *D* a Set of Discrete Points

If $x_m=m(m=0, 1, 2, \ldots, N)$ and $w(x)=1$, use the Chebyshev polynomials in the discrete range **22.17.** It is convenient to introduce here a slightly different standardization such that

$$f_n(x)=\sum_{m=0}^{n}(-1)^m\binom{n}{m}\binom{n+m}{m}\frac{x!(N-m)!}{(x-m)!N!}$$

$$(f_n, f_n)=\frac{(N+n+1)!(N-n)!}{(2n+1)(N!)^2}$$

Recurrence relation: $f_0(x)=1, f_1(x)=1-\frac{2x}{N}$

$$(n+1)(N-n)f_{n+1}(x)=(2n+1)(N-2x)f_n(x)-n(N+n+1)f_{n-1}(x)$$

**Example 6.** Approximate in the least square sense the function $f(x)$ given in the following table by a third degree polynomial.

| $x$ | $f(x)$ | $\bar{x}=\frac{x-10}{2}$ | $f_0(\bar{x})$ | $f_1(\bar{x})$ | $f_2(\bar{x})$ | $f_3(\bar{x})$ |
|---|---|---|---|---|---|---|
| 10 | .3162 | 0 | 1 | 1 | 1 | 1 |
| 12 | .2887 | 1 | 1 | 1/2 | −1/2 | −2 |
| 14 | .2673 | 2 | 1 | 0 | −1 | 0 |
| 16 | .2500 | 3 | 1 | −1/2 | −1/2 | 2 |
| 18 | .2357 | 4 | 1 | −1 | 1 | −1 |

|  | $f_0(\bar{x})$ | $f_1(\bar{x})$ | $f_2(\bar{x})$ | $f_3(\bar{x})$ |
|---|---|---|---|---|

### 22.20. Economization of Series

*Problem:* Given $f(x)=\sum_{m=0}^{n}a_mx^m$ in the interval $-1\leq x\leq 1$ and $R>0$. Find $\bar{f}(x)=\sum_{m=0}^{N}b_mx^m$ with $N$ as small as possible, such that $|\bar{f}(x)-f(x)|<R$.

*Solution:* Express $f(x)$ in terms of Chebyshev polynomials using **Table 22.3,**

$$f(x)=\sum_{m=0}^{n}b_mT_m(x)$$

Then, since $|T_m(x)|\leq 1(-1\leq x\leq 1)$

$$\bar{f}(x)=\sum_{m=0}^{N}b_mT_m(x)$$

within the desired accuracy if

$$\sum_{m=N+1}^{n}|b_m|<R$$

$\bar{f}(x)$ is evaluated most conveniently by using the recurrence relation (see **22.7**).

**Example 7.** Economize $f(x)=1+x/2+x^2/3+x^3/4+x^4/5+x^5/6$ with $R=.05$.

From **Table 22.3**

$$f(x)=\frac{1}{120}[149T_0(x)+32T_2(x)+3T_4(x)]$$

$$+\frac{1}{96}[76T_1(x)+11T_3(x)+T_5(x)]$$

so

$$\bar{f}(x)=\frac{1}{120}[149T_0(x)+32T_2(x)]+\frac{1}{96}[76T_1(x)+11T_3(x)]$$

since $$|\bar{f}(x)-f(x)|\leq\frac{1}{40}+\frac{1}{96}<.05$$

# 23. Bernoulli and Euler Polynomials—Riemann Zeta Function

## Mathematical Properties

### 23.1. Bernoulli and Euler Polynomials and the Euler-Maclaurin Formula

**Generating Functions**

**23.1.1** $$\frac{te^{xt}}{e^t-1}=\sum_{n=0}^{\infty} B_n(x)\,\frac{t^n}{n!} \qquad |t|<2\pi$$

$$\frac{2e^{xt}}{e^t+1}=\sum_{n=0}^{\infty} E_n(x)\,\frac{t^n}{n!} \qquad |t|<\pi$$

**Bernoulli and Euler Numbers**

**23.1.2** $$B_n=B_n(0) \qquad n=0, 1, \ldots$$

$$E_n=2^nE_n\left(\frac{1}{2}\right)=\text{ integer} \qquad n=0, 1, \ldots$$

**23.1.3** $$B_0=1,\ B_1=-\frac{1}{2},\ B_2=\frac{1}{6},\ B_4=-\frac{1}{30}$$

$$E_0=1,\ E_2=-1,\ E_4=5$$

(For occurrence of $B_n$ and $E_n$ in series expansions of circular functions, see chapter 4.)

**Sums of Powers**

**23.1.4** $$\sum_{k=1}^{m} k^n=\frac{B_{n+1}(m+1)-B_{n+1}}{n+1} \qquad m, n=1, 2, \ldots$$

$$\sum_{k=1}^{m} (-1)^{m-k}k^n=\frac{E_n(m+1)+(-1)^mE_n(0)}{2} \qquad m, n=1, 2, \ldots$$

**Derivatives and Differences**

**23.1.5** $$B_n'(x)=nB_{n-1}(x) \qquad n=1, 2, \ldots$$

$$E_n'(x)=nE_{n-1}(x) \qquad n=1, 2, \ldots$$

**23.1.6** $$B_n(x+1)-B_n(x)=nx^{n-1} \qquad n=0, 1, \ldots$$

$$E_n(x+1)+E_n(x)=2x^n \qquad n=0, 1, \ldots$$

**Expansions**

**23.1.7**

$$B_n(x+h)=\sum_{k=0}^{n}\binom{n}{k} B_k(x)h^{n-k} \qquad n=0, 1, \ldots$$

$$E_n(x+h)=\sum_{k=0}^{n}\binom{n}{k} E_k(x)h^{n-k} \qquad n=0, 1, \ldots$$

$$E_n(x)=\sum_{k=0}^{n}\binom{n}{k}\frac{E_k}{2^k}\left(x-\frac{1}{2}\right)^{n-k} \qquad n=0, 1, \ldots$$

**Symmetry**

**23.1.8** $$B_n(1-x)=(-1)^nB_n(x) \qquad n=0, 1, \ldots$$

$$E_n(1-x)=(-1)^nE_n(x) \qquad n=0, 1, \ldots$$

**23.1.9** $$(-1)^nB_n(-x)=B_n(x)+nx^{n-1} \qquad n=0,1,\ldots$$

$$(-1)^{n+1}E_n(-x)=E_n(x)-2x^n \qquad n=0, 1, \ldots$$

**Multiplication Theorem**

**23.1.10**

$$B_n(mx)=m^{n-1}\sum_{k=0}^{m-1} B_n\left(x+\frac{k}{m}\right) \qquad \begin{array}{l} n=0, 1, \ldots \\ m=1, 2, \ldots \end{array}$$

$$E_n(mx)=m^n\sum_{k=0}^{m-1} (-1)^kE_n\left(x+\frac{k}{m}\right) \qquad \begin{array}{l} n=0, 1, \ldots \\ m=1, 3, \ldots \end{array}$$

$$E_n(mx)=-\frac{2}{n+1}\,m^n\sum_{k=0}^{m-1} (-1)^kB_{n+1}\left(x+\frac{k}{m}\right) \qquad \begin{array}{l} n=0, 1, \ldots \\ m=2, 4, \ldots \end{array}$$

### Integrals

**23.1.11**

$$\int_a^x B_n(t)dt=\frac{B_{n+1}(x)-B_{n+1}(a)}{n+1}$$

$$\int_a^x E_n(t)dt=\frac{E_{n+1}(x)-E_{n+1}(a)}{n+1}$$

**23.1.12**

$$\int_0^1 B_n(t)B_m(t)dt=(-1)^{n-1}\frac{m!n!}{(m+n)!}B_{m+n}\qquad m,n=1,2,\ldots$$

$$\int_0^1 E_n(t)E_m(t)dt=(-1)^n 4(2^{m+n+2}-1)\frac{m!n!}{(m+n+2)!}B_{m+n+2}\qquad m,n=0,1,\ldots$$

(The polynomials are orthogonal for $m+n$ odd.)

### Inequalities

**23.1.13**

$$|B_{2n}|>|B_{2n}(x)|\qquad n=1,2,\ldots,\qquad 1>x>0$$

$$4^{-n}|E_{2n}|>(-1)^nE_{2n}(x)>0\qquad n=1,2,\ldots,\qquad \tfrac{1}{2}>x>0$$

**23.1.14**

$$\frac{2(2n+1)!}{(2\pi)^{2n+1}}\left(\frac{1}{1-2^{-2n}}\right)>(-1)^{n+1}B_{2n+1}(x)>0\qquad n=1,2,\ldots,\qquad \tfrac{1}{2}>x>0$$

$$\frac{4(2n-1)!}{\pi^{2n}}\left(1+\frac{1}{2^{2n}-2}\right)>(-1)^nE_{2n-1}(x)>0\qquad n=1,2,\ldots,\qquad \tfrac{1}{2}>x>0$$

**23.1.15**

$$\frac{2(2n)!}{(2\pi)^{2n}}\left(\frac{1}{1-2^{1-2n}}\right)>(-1)^{n+1}B_{2n}>\frac{2(2n)!}{(2\pi)^{2n}}\qquad n=1,2,\ldots$$

$$\frac{4^{n+1}(2n)!}{\pi^{2n+1}}>(-1)^nE_{2n}>\frac{4^{n+1}(2n)!}{\pi^{2n+1}}\left(\frac{1}{1+3^{-1-2n}}\right)\qquad n=0,1,\ldots$$

### Fourier Expansions

**23.1.16**

$$B_n(x)=-2\frac{n!}{(2\pi)^n}\sum_{k=1}^{\infty}\frac{\cos\,(2\pi kx-\frac{1}{2}\pi n)}{k^n}\qquad \begin{array}{l} n>1,1\geq x\geq 0\\ n=1,1>x>0\end{array}$$

$$E_n(x)=4\frac{n!}{\pi^{n+1}}\sum_{k=0}^{\infty}\frac{\sin\,((2k+1)\pi x-\frac{1}{2}\pi n)}{(2k+1)^{n+1}}\qquad \begin{array}{l} n>0,1\geq x\geq 0\\ n=0,1>x>0\end{array}$$

**23.1.17**

$$B_{2n-1}(x)=\frac{(-1)^n2(2n-1)!}{(2\pi)^{2n-1}}\sum_{k=1}^{\infty}\frac{\sin 2k\pi x}{k^{2n-1}}\qquad \begin{array}{l} n>1,\ 1\geq x\geq 0\\ n=1,1>x>0\end{array}$$

$$E_{2n-1}(x)=\frac{(-1)^n4(2n-1)!}{\pi^{2n}}\sum_{k=0}^{\infty}\frac{\cos\,(2k+1)\pi x}{(2k+1)^{2n}}\qquad n=1,2,\ldots,\qquad 1\geq x\geq 0$$

**23.1.18**

$$B_{2n}(x)=\frac{(-1)^{n-1}2(2n)!}{(2\pi)^{2n}}\sum_{k=1}^{\infty}\frac{\cos 2k\pi x}{k^{2n}}\qquad n=1,2,\ldots,\qquad 1\geq x\geq 0$$

$$E_{2n}(x)=\frac{(-1)^n4(2n)!}{\pi^{2n+1}}\sum_{k=0}^{\infty}\frac{\sin\,(2k+1)\pi x}{(2k+1)^{2n+1}}\qquad \begin{array}{l} n>0,1\geq x\geq 0\\ n=0,1>x>0\end{array}$$

### Special Values

**23.1.19**

$$B_{2n+1}=0\qquad n=1,2,\ldots$$

$$E_{2n+1}=0\qquad n=0,1,\ldots$$

**23.1.20**

$$B_n(0)=(-1)^nB_n(1)=B_n\qquad n=0,1,\ldots$$

$$E_n(0)=-E_n(1)=-2(n+1)^{-1}(2^{n+1}-1)B_{n+1}\qquad n=1,2,\ldots$$

**23.1.21**

$$B_n(\tfrac{1}{2})=-(1-2^{1-n})B_n\qquad n=0,1,\ldots$$

$$E_n(\tfrac{1}{2})=2^{-n}E_n\qquad n=0,1,\ldots$$

**23.1.22**
$$B_n(\tfrac{1}{4})=(-1)^nB_n(\tfrac{3}{4})$$
$$=-2^{-n}(1-2^{1-n})B_n-n4^{-n}E_{n-1} \qquad n=1,2,\ldots$$

**23.1.23**
$$B_{2n}(\tfrac{1}{3})=B_{2n}(\tfrac{2}{3})$$
$$=-2^{-1}(1-3^{1-2n})B_{2n} \qquad n=0,1,\ldots$$

**23.1.24**
$$B_{2n}(\tfrac{1}{6})=B_{2n}(\tfrac{5}{6})$$
$$=2^{-1}(1-2^{1-2n})(1-3^{1-2n})B_{2n} \qquad n=0,1,\ldots$$

$$E_{2n-1}(\tfrac{1}{3})=-E_{2n-1}(\tfrac{2}{3})$$
$$=-(2n)^{-1}(1-3^{1-2n})(2^{2n}-1)B_{2n} \qquad n=1,2,\ldots$$

### Symbolic Operations

**23.1.25** $p(B(x)+1)-p(B(x))=p'(x)$ | $p(E(x)+1)+p(E(x))=2p(x)$

**23.1.26** $B_n(x+h)=(B(x)+h)^n \quad n=0,\ 1,\ \ldots$ | $E_n(x+h)=(E(x)+h)^n \quad n=0,\ 1,\ \ldots$

Here $p(x)$ denotes a polynomial in $x$ and after expanding we set $\{B(x)\}^n=B_n(x)$ and $\{E(x)\}^n=E_n(x)$.

### Relations Between the Polynomials

**23.1.27**
$$E_{n-1}(x)=\frac{2^n}{n}\left\{B_n\left(\frac{x+1}{2}\right)-B_n\left(\frac{x}{2}\right)\right\}$$
$$=\frac{2}{n}\left\{B_n(x)-2^nB_n\left(\frac{x}{2}\right)\right\} \qquad n=1,2,\ldots$$

**23.1.28**
$$E_{n-2}(x)=2\binom{n}{2}^{-1}\sum_{k=0}^{n-2}\binom{n}{k}(2^{n-k}-1)B_{n-k}B_k(x)$$
$$n=2,3,\ldots$$

**23.1.29**
$$B_n(x)=2^{-n}\sum_{k=0}^{n}\binom{n}{k}B_{n-k}E_k(2x) \qquad n=0,1,\ldots$$

### Euler-Maclaurin Formulas

Let $F(x)$ have its first $2n$ derivatives continuous on an interval $(a,\ b)$. Divide the interval into $m$ equal parts and let $h=(b-a)/m$. Then for some $\theta$, $1>\theta>0$, depending on $F^{(2n)}(x)$ on $(a,\ b)$, we have

**23.1.30**
$$\sum_{k=0}^{m}F(a+kh)=\frac{1}{h}\int_a^b F(t)dt+\frac{1}{2}\{F(b)+F(a)\}$$
$$+\sum_{k=1}^{n-1}\frac{h^{2k-1}}{(2k)!}B_{2k}\{F^{(2k-1)}(b)-F^{(2k-1)}(a)\}$$
$$+\frac{h^{2n}}{(2n)!}B_{2n}\sum_{k=0}^{m-1}F^{(2n)}(a+kh+\theta h)$$

Equivalent to this is

**23.1.31**
$$\frac{1}{h}\int_x^{x+h}F(t)dt=\frac{1}{2}\{F(x+h)+F(x)\}$$
$$-\sum_{k=1}^{n-1}\frac{h^{2k-1}}{(2k)!}B_{2k}\{F^{(2k-1)}(x+h)-F^{(2k-1)}(x)\}$$
$$-\frac{h^{2n}}{(2n)!}B_{2n}F^{(2n)}(x+\theta h) \qquad b-h\geq x\geq a$$

Let $\hat{B}_n(x)=B_n(x-[x])$. The Euler Summation Formula is

**23.1.32**
$$\sum_{k=0}^{m-1}F(a+kh+\omega h)=\frac{1}{h}\int_a^b F(t)dt$$
$$+\sum_{k=1}^{p}\frac{h^{k-1}}{k!}B_k(\omega)\{F^{(k-1)}(b)-F^{(k-1)}(a)\}$$
$$-\frac{h^p}{p!}\int_0^1\hat{B}_p(\omega-t)\left\{\sum_{k=0}^{m-1}F^{(p)}(a+kh+th)\right\}dt$$
$$p\leq 2n,\ 1\geq\omega\geq 0$$

## 23.2. Riemann Zeta Function and Other Sums of Reciprocal Powers

**23.2.1** $$\zeta(s)=\sum_{k=1}^{\infty} k^{-s} \qquad \mathscr{R}s>1$$

**23.2.2** $$=\prod_{p}(1-p^{-s})^{-1} \qquad \mathscr{R}s>1$$

(product over all primes $p$).

**23.2.3** $$=\frac{1}{s-1}+\frac{1}{2}+\sum_{k=1}^{n}\frac{B_{2k}}{2k}\binom{s+2k-2}{2k-1} -\binom{s+2n}{2n+1}\int_{1}^{\infty}\frac{B_{2n+1}(x-[x])}{x^{s+2n+1}}\,dx$$

$$s\neq 1,\ n=1,2,\ldots,\quad \mathscr{R}s>-2n$$

* **23.2.4** $$=-\frac{\Gamma(1-s)}{2\pi i}\int_{C}\frac{(-z)^{s-1}}{e^{z}-1}\,dz$$

**23.2.5** $$=\frac{1}{s-1}+\sum_{n=0}^{\infty}\frac{(-1)^{n}}{n!}\gamma_{n}(s-1)^{n}$$

where

$$\gamma_{n}=\lim_{m\to\infty}\left\{\sum_{k=1}^{m}\frac{(\ln k)^{n}}{k}-\frac{(\ln m)^{n+1}}{n+1}\right\}$$

$$\mathscr{R}s>0$$

**23.2.6** $$=2^{s}\pi^{s-1}\sin\left(\tfrac{1}{2}\pi s\right)\Gamma(1-s)\zeta(1-s)$$

**23.2.7** $$=\frac{1}{\Gamma(s)}\int_{0}^{\infty}\frac{x^{s-1}}{e^{x}-1}\,dx \qquad \mathscr{R}s>1$$

**23.2.8** $$=\frac{1}{(1-2^{1-s})\Gamma(s)}\int_{0}^{\infty}\frac{x^{s-1}}{e^{x}+1}\,dx$$

**23.2.9** $$=\sum_{k=1}^{n}k^{-s}+(s-1)^{-1}n^{1-s}-s\int_{n}^{\infty}\frac{x-[x]}{x^{s+1}}\,dx$$

$$n=1,2,\ldots,\ \mathscr{R}s>0$$

**23.2.10** $$=\frac{\exp\left(\ln 2\pi-1-\tfrac{1}{2}\gamma\right)s}{2(s-1)\Gamma\left(\tfrac{1}{2}s+1\right)}\prod_{\rho}\left(1-\frac{s}{\rho}\right)e^{\frac{s}{\rho}}$$

product over all zeros $\rho$ of $\zeta(s)$ with $\mathscr{R}\rho>0$.

The contour $C$ in the fourth formula starts at infinity on the positive real axis, circles the origin once in the positive direction excluding the points $\pm 2ni\pi$ for $n=1, 2, \ldots$, and returns to the starting point. Therefore $\zeta(s)$ is regular for all values of $s$ except for a simple pole at $s=1$ with residue 1.

### Special Values

**23.2.11** $$\zeta(0)=-\tfrac{1}{2}$$

**23.2.12** $$\zeta(1)=\infty$$

**23.2.13** $$\zeta'(0)=-\tfrac{1}{2}\ln 2\pi$$

**23.2.14** $$\zeta(-2n)=0 \qquad n=1,2,\ldots$$

**23.2.15** $$\zeta(1-2n)=-\frac{B_{2n}}{2n} \qquad n=1,2,\ldots$$

**23.2.16** $$\zeta(2n)=\frac{(2\pi)^{2n}}{2(2n)!}|B_{2n}| \qquad n=1,2,\ldots$$

**23.2.17**

$$\zeta(2n+1)=\frac{(-1)^{n+1}(2\pi)^{2n+1}}{2(2n+1)!}\int_{0}^{1}B_{2n+1}(x)\cot(\pi x)\,dx$$

$$n=1,2,\ldots$$

### Sums of Reciprocal Powers

The sums referred to are

**23.2.18** $$\zeta(n)=\sum_{k=1}^{\infty}k^{-n} \qquad n=2,3,\ldots$$

**23.2.19**

$$\eta(n)=\sum_{k=1}^{\infty}(-1)^{k-1}k^{-n}=(1-2^{1-n})\zeta(n) \qquad n=1,2,\ldots$$

**23.2.20**

$$\lambda(n)=\sum_{k=0}^{\infty}(2k+1)^{-n}=(1-2^{-n})\zeta(n) \qquad n=2,3,\ldots$$

**23.2.21**

$$\beta(n)=\sum_{k=0}^{\infty}(-1)^{k}(2k+1)^{-n} \qquad n=1,2,\ldots$$

These sums can be calculated from the Bernoulli and Euler polynomials by means of the last two formulas for special values of the zeta function (note that $\eta(1)=\ln 2$), and

**23.2.22** $$\beta(2n+1)=\frac{(\pi/2)^{2n+1}}{2(2n)!}|E_{2n}| \qquad n=0,1,\ldots$$

**23.2.23**

$$\beta(2n)=\frac{(-1)^{n}\pi^{2n}}{4(2n-1)!}\int_{0}^{1}E_{2n-1}(x)\sec(\pi x)\,dx$$

$$n=1,2,\ldots$$

$\beta(2)$ is known as Catalan's constant. Some other special values are

**23.2.24** $$\zeta(2)=1+\frac{1}{2^{2}}+\frac{1}{3^{2}}+\ldots=\frac{\pi^{2}}{6}$$

**23.2.25** $$\zeta(4)=1+\frac{1}{2^{4}}+\frac{1}{3^{4}}+\ldots=\frac{\pi^{4}}{90}$$

---

*See page II.

**23.2.26** $$\eta(2)=1-\frac{1}{2^2}+\frac{1}{3^2}-\ldots=\frac{\pi^2}{12}$$

**23.2.27** $$\eta(4)=1-\frac{1}{2^4}+\frac{1}{3^4}-\ldots=\frac{7\pi^4}{720}$$

**23.2.28** $$\lambda(2)=1+\frac{1}{3^2}+\frac{1}{5^2}+\ldots=\frac{\pi^2}{8}$$

**23.2.29** $$\lambda(4)=1+\frac{1}{3^4}+\frac{1}{5^4}+\ldots=\frac{\pi^4}{96}$$

**23.2.30** $$\beta(1)=1-\frac{1}{3}+\frac{1}{5}-\ldots=\frac{\pi}{4}$$

**23.2.31** $$\beta(3)=1-\frac{1}{3^3}+\frac{1}{5^3}-\ldots=\frac{\pi^3}{32}$$

# 24. Combinatorial Analysis

## Mathematical Properties

In each sub-section of this chapter we use a fixed format which emphasizes the use and methods of extending the accompanying tables. The format follows this form:

**I. Definitions**
- A. Combinatorial
- B. Generating functions
- C. Closed form

**II. Relations**
- A. Recurrences
- B. Checks in computing
- C. Basic use in numerical analysis

**III. Asymptotic and Special Values**

In general the notations used are standard. This includes the difference operator $\Delta$ defined on functions of $x$ by $\Delta f(x)=f(x+1)-f(x)$, $\Delta^{n+1}f(x)=\Delta(\Delta^n f(x))$, the Kronecker delta $\delta_{ij}$, the Riemann zeta function $\zeta(s)$ and the greatest common divisor symbol $(m,n)$. The range of the summands for a summation sign without limits is explained to the right of the formula.

The notations which are not standard are those for the multinomials which are arbitrary shorthand for use in this chapter, and those for the Stirling numbers which have never been standardized. A short table of various notations for these numbers follows:

**Notations for the Stirling Numbers**

| *Reference* | *First Kind* | *Second Kind* | |
|---|---|---|---|
| This chapter | $S_n^{(m)}$ | $\mathfrak{S}_n^{(m)}$ | |
| [24.2] Fort | $S_n^{(m)}$ | $\mathscr{S}_n^{(m)}$ | * |
| [24.7] Jordan | $S_n^m$ | $\mathfrak{S}_n^m$ | * |
| [24.10] Moser and Wyman | $S_n^m$ | $\sigma_n^m$ | |
| [24.9] Milne-Thomson | $\binom{n-1}{m-1}B_{n-m}^{(n)}$ | $\binom{n}{m}B_{n-m}^{(-m)}$ | |
| [24.15] Riordan | $s(n,m)$ | $S(n,m)$ | |
| [24.1] Carlitz<br>[24.3] Gould | $(-1)^{n-m}S_1(n-1,n-m)$ | $S_2(m,n-m)$ | |
| Miksa (Unpublished tables) | $S(n-m+1,n)$ | ${}_mS_n$ | |
| [24.17] Gupta | | $u(n,m)$ | |

We feel that a capital $S$ is natural for Stirling numbers of the first kind; it is infrequently used for other notation in this context. But once it is used we have difficulty finding a suitable symbol for Stirling numbers of the second kind. The numbers are sufficiently important to warrant a special and easily recognizable symbol, and yet that symbol must be easy to write. We have settled on a script capital $\mathfrak{S}$ without any certainty that we have settled this question permanently.

We feel that the subscript-superscript notation emphasizes the generating functions (which are powers of mutually inverse functions) from which most of the important relations flow.

### 24.1. Basic Numbers

### 24.1.1 Binomial Coefficients

**I. Definitions**

A. $\binom{n}{m}$ is the number of ways of choosing $m$ objects from a collection of $n$ distinct objects without regard to order.

B. Generating functions

$$* \quad (1+x)^n=\sum_{m=0}^{n}\binom{n}{m}x^m \qquad n=0,1,\ldots$$

$$(1-x)^{-m-1}=\sum_{n=m}^{\infty}\binom{n}{m}x^{n-m} \qquad |x|<1$$

C. Closed form

$$\binom{n}{m}=\frac{n!}{m!(n-m)!}=\binom{n}{n-m} \qquad n\geq m$$

$$=\frac{n(n-1)\ldots(n-m+1)}{m!}$$

**II. Relations**

A. Recurrences

$$\binom{n+1}{m}=\binom{n}{m}+\binom{n}{m-1} \qquad n\geq m\geq 1$$

$$=\binom{n}{m}+\binom{n-1}{m-1}+\ldots+\binom{n-m}{0} \qquad n\geq m$$

B. Checks

$$\sum_{m=0}^{n}\binom{r}{m}\binom{s}{n-m}=\binom{r+s}{n} \qquad r+s\geq n$$

$$\sum_{m=0}^{n}(-1)^{n-m}\binom{r}{m}=\binom{r-1}{n} \qquad r\geq n+1$$

$$\binom{n}{m}\equiv\binom{n_0}{m_0}\binom{n_1}{m_1}\ldots \pmod{p} \qquad p \text{ a prime}$$

---

*See page II.

where

$$n=\sum_{k=0}^{\infty} n_k p^k, \qquad m=\sum_{k=0}^{\infty} m_k p^k \qquad p>m_k,\ n_k\geq 0$$

C. Numerical analysis

$$\Delta^n f(x)=\sum_{m=0}^{n} (-1)^{n-m}\binom{n}{m} f(x+m)$$

$$=\sum_{k=0}^{r}\binom{r}{k}\Delta^{n+k} f(x-r)$$

$$\sum_{m=0}^{s} (-1)^m\binom{n}{m} f(x-m)$$

$$=\sum_{k=0}^{s} (-1)^{s-k}\binom{n-k-1}{s-k}\Delta^k f(x-s) \qquad s<n$$

**III. Special Values**

$$\binom{n}{0}=\binom{n}{n}=1$$

$$\binom{2n}{n}=\frac{2^n(2n-1)(2n-3)\ldots 3\cdot 1}{n!}$$

## 24.1.2 Multinomial Coefficients

### I. Definitions

A. $(n;\, n_1, n_2, \ldots, n_m)$ is the number of ways of putting $n=n_1+n_2+\ldots+n_m$ different objects into $m$ different boxes with $n_k$ in the $k$-th box, $k=1, 2, \ldots, m$.

$(n;\, a_1, a_2, \ldots, a_n)^*$ is the number of permutations of $n=a_1+2a_2+\ldots+na_n$ symbols composed of $a_k$ cycles of length $k$ for $k=1, 2, \ldots, n$.

$(n;\, a_1, a_2, \ldots, a_n)'$ is the number of ways of partitioning a set of $n=a_1+2a_2+\ldots+na_n$ different objects into $a_k$ subsets containing $k$ objects for $k=1, 2, \ldots, n$.

B. Generating functions

$$(x_1+x_2+\ldots+x_m)^n=\Sigma(n;\, n_1, n_2, \ldots, n_m)x_1^{n_1}x_2^{n_2}\ldots x_m^{n_m} \qquad \text{summed over } n_1+n_2+\ldots+n_m=n$$

$$\left(\sum_{k=1}^{\infty}\frac{x_k}{k}t^k\right)^m=m!\sum_{n=m}^{\infty}\frac{t^n}{n!}\Sigma(n;\, a_1, a_2, \ldots, a_n)^* x_1^{a_1}x_2^{a_2}\ldots x_n^{a_n}$$

summed over $a_1+2a_2+\ldots+na_n=n$ and $a_1+a_2+\ldots+a_n=m$

$$\left(\sum_{k=1}^{\infty}\frac{x_k}{k!}t^k\right)^m=m!\sum_{n=m}^{\infty}\frac{t^n}{n!}\Sigma(n;\, a_1, a_2, \ldots, a_n)' x_1^{a_1}x_2^{a_2}\ldots x_n^{a_n}$$

C. Closed forms

$$(n; n_1, n_2, \ldots, n_m)=n!/n_1!n_2!\ldots n_m! \qquad n_1+n_2+\ldots+n_m=n$$

$$(n; a_1, a_2, \ldots, a_n)^*=n!/1^{a_1}a_1!2^{a_2}a_2!\ldots n^{a_n}a_n! \qquad a_1+2a_2+\ldots+na_n=n$$

$$(n; a_1, a_2, \ldots, a_n)'=n!/(1!)^{a_1}a_1!(2!)^{a_2}a_2!\ldots (n!)^{a_n}a_n! \qquad a_1+2a_2+\ldots+na_n=n$$

### II. Relations

A. Recurrence

$$(n+m; n_1+1, n_2+1, \ldots, n_m+1)=\sum_{k=1}^{m}(n+m-1; n_1+1, \ldots, n_{k-1}+1, n_k, n_{k+1}+1, \ldots, n_m+1)$$

B. Checks

* $$\Sigma(n; n_1, n_2, \ldots, n_m)=\begin{Bmatrix} m^n & \text{all } n_i\geqslant 1 \\ m!\ \mathfrak{S}_n^{(m)} & \end{Bmatrix} \qquad \text{summed over } n_1+n_2+\ldots+n_m=n$$

$$\Sigma(n; a_1, a_2, \ldots, a_n)^*=(-1)^{n-m}S_n^{(m)}$$

$$\Sigma(n; a_1, a_2, \ldots, a_n)'=\mathfrak{S}_n^{(m)}$$

summed over $a_1+2a_2+\ldots+na_n=n$ and $a_1+a_2+\ldots+a_n=m$

C. Numerical analysis (Faà di Bruno's formula)

$$\frac{d^n}{dx^n}f(g(x))=\sum_{m=0}^{n} f^{(m)}(g(x))\Sigma(n; a_1, a_2, \ldots, a_n)'\{g'(x)\}^{a_1}\{g''(x)\}^{a_2}\ldots\{g^{(n)}(x)\}^{a_n}$$

summed over $a_1+2a_2+\ldots+na_n=n$ and $a_1+a_2+\ldots+a_n=m$.

---

*See page II.

$$\begin{vmatrix} P_1 & 1 & 0 & \dots & 0 \\ P_2 & P_1 & 2 & \dots & . \\ P_3 & P_2 & P_1 & \dots & . \\ . & . & . & \dots & . \\ . & . & . & \dots & 0 \\ . & . & . & \dots & n-1 \\ P_n & P_{n-1} & P_{n-2} & \dots & P_1 \end{vmatrix} = \Sigma(-1)^{n-\Sigma a_i}(n;\, a_1, a_2, \dots, a_n)^* P_1^{a_1} P_2^{a_2} \dots P_n^{a_n}$$

summed over $a_1+2a_2+\dots+na_n=n$; e.g. if $P_k=\Sigma_{j=1}^{r} x_j^k$ for $k=1, 2, \dots, n$ then the determinant and sum equal $n!\Sigma x_1x_2\dots x_n$, the latter sum denoting the $n$-th elementary symmetric function of $x_1, x_2, \dots, x_r$.

### 24.1.3 Stirling Numbers of the First Kind

#### I. Definitions

A. $(-1)^{n-m}S_n^{(m)}$ is the number of permutations of $n$ symbols which have exactly $m$ cycles.

B. Generating functions

$$x(x-1)\dots(x-n+1)=\sum_{m=0}^{n} S_n^{(m)}x^m$$

$$\{\ln(1+x)\}^m=m!\sum_{n=m}^{\infty} S_n^{(m)}\frac{x^n}{n!} \qquad |x|<1$$

C. Closed form (see closed form for $\mathfrak{S}_n^{(m)}$)

$$S_n^{(m)}=\sum_{k=0}^{n-m}(-1)^k\binom{n-1+k}{n-m+k}\binom{2n-m}{n-m-k}\mathfrak{S}_{n-m+k}^{(k)}$$

#### II. Relations

A. Recurrences

$$S_{n+1}^{(m)}=S_n^{(m-1)}-nS_n^{(m)} \qquad n\geq m\geq 1$$

$$\binom{m}{r}S_n^{(m)}=\sum_{k=m-r}^{n-r}\binom{n}{k}S_{n-k}^{(r)}S_k^{(m-r)} \qquad n\geq m\geq r$$

B. Checks

$$\sum_{m=1}^{n} S_n^{(m)}=0 \qquad n>1$$

$$\sum_{m=0}^{n}(-1)^{n-m}S_n^{(m)}=n!$$

$$\sum_{k=m}^{n} S_{n+1}^{(k+1)}n^{k-m}=S_n^{(m)}$$

C. Numerical analysis

$$\frac{d^m}{dx^m}f(x)=m!\sum_{n=m}^{\infty}\frac{S_n^{(m)}}{n!}\Delta^n f(x)$$

if convergent.

#### III. Asymptotics and Special Values

$$|S_n^{(m)}|\sim(n-1)!(\gamma+\ln n)^{m-1}/(m-1)!$$

for $m=o(\ln n)$

$$\lim_{m\to\infty}\frac{S_{n+m}^{(m)}}{m^{2n}}=\frac{(-1)^n}{2^n n!}$$

$$\lim_{n\to\infty}\frac{S_{n+1}^{(m)}}{nS_n^{(m)}}=-1$$

$$S_n^{(0)}=\delta_{0n}$$

$$S_n^{(1)}=(-1)^{n-1}(n-1)!$$

$$S_n^{(n-1)}=-\binom{n}{2}$$

$$S_n^{(n)}=1$$

### 24.1.4 Stirling Numbers of the Second Kind

#### I. Definitions

A. $\mathfrak{S}_n^{(m)}$ is the number of ways of partitioning a set of $n$ elements into $m$ non-empty subsets.

B. Generating functions

$$x^n=\sum_{m=0}^{n}\mathfrak{S}_n^{(m)}x(x-1)\dots(x-m+1)$$

$$(e^x-1)^m=m!\sum_{n=m}^{\infty}\mathfrak{S}_n^{(m)}\frac{x^n}{n!}$$

$$(1-x)^{-1}(1-2x)^{-1}\dots(1-mx)^{-1}=\sum_{n=m}^{\infty}\mathfrak{S}_n^{(m)}x^{n-m}$$

$$|x|<m^{-1}$$

C. Closed form

$$\mathfrak{S}_n^{(m)}=\frac{1}{m!}\sum_{k=0}^{m}(-1)^{m-k}\binom{m}{k}k^n$$

### II. Relations

A. Recurrences

$$\mathfrak{S}_{n+1}^{(m)}=m\,\mathfrak{S}_n^{(m)}+\mathfrak{S}_n^{(m-1)} \qquad n\geq m\geq 1$$

$$\binom{m}{r}\mathfrak{S}_n^{(m)}=\sum_{k=m-r}^{n-r}\binom{n}{k}\mathfrak{S}_{n-k}^{(r)}\,\mathfrak{S}_k^{(m-r)} \qquad n\geq m\geq r$$

B. Checks

$$\sum_{m=0}^{n}(-1)^{n-m}m!\,\mathfrak{S}_n^{(m)}=1$$

$$\sum_{k=m}^{n}\mathfrak{S}_{k-1}^{(m-1)}m^{n-k}=\mathfrak{S}_n^{(m)}$$

$$\mathfrak{S}_n^{(m)}=\sum_{k=0}^{n-m}(-1)^k\binom{n-1+k}{n-m+k}\binom{2n-m}{n-m-k}S_{n-m+k}^{(k)}$$

$$\sum_{k=m}^{n}S_k^{(m)}\,\mathfrak{S}_n^{(k)}=\sum_{k=m}^{n}S_n^{(k)}\,\mathfrak{S}_k^{(m)}=\delta_{mn}$$

C. Numerical analysis

$$\Delta^m f(x)=m!\sum_{n=m}^{\infty}\frac{\mathfrak{S}_n^{(m)}}{n!}f^{(n)}(x) \qquad \text{if convergent}$$

$$\sum_{k=0}^{n}k^m=\sum_{k=0}^{m}k!\,\mathfrak{S}_m^{(k)}\binom{n+1}{k+1}$$

$$\sum_{k=0}^{n}k^m x^k=\sum_{j=0}^{m}\mathfrak{S}_m^{(j)}x^j\frac{d^j}{dx^j}\left\{\frac{1-x^{n+1}}{1-x}\right\}$$

### III. Asymptotics and Special Values

* $$\lim_{n\to\infty}m^{-n}\,\mathfrak{S}_n^{(m)}=(m!)^{-1}$$

$$\mathfrak{S}_{n+m}^{(m)}\sim\frac{m^{2n}}{2^n n!} \qquad \text{for } n=o(m^{\frac{1}{2}})$$

$$\lim_{n\to\infty}\frac{\mathfrak{S}_{n+1}^{(m)}}{\mathfrak{S}_n^{(m)}}=m$$

$$\mathfrak{S}_n^{(0)}=\delta_{0n}$$

$$\mathfrak{S}_n^{(1)}=\mathfrak{S}_n^{(n)}=1$$

$$\mathfrak{S}_n^{(n-1)}=\binom{n}{2}$$

## 24.2. Partitions

### 24.2.1 Unrestricted Partitions

### I. Definitions

A. $p(n)$ is the number of decompositions of $n$ into integer summands without regard to order. E.g., $5=1+4=2+3=1+1+3=1+2+2=1+1+1+2=1+1+1+1+1$ so that $p(5)=7$.

B. Generating function

$$\sum_{n=0}^{\infty}p(n)x^n=\prod_{n=1}^{\infty}(1-x^n)^{-1}=\left\{\sum_{n=-\infty}^{\infty}(-1)^n x^{\frac{3n^2+n}{2}}\right\}^{-1} \qquad |x|<1$$

C. Closed form

$$p(n)=\frac{1}{\pi\sqrt{2}}\sum_{k=1}^{\infty}\sqrt{k}A_k(n)\frac{d}{dn}\frac{\sinh\left\{\frac{\pi}{k}\sqrt{\frac{2}{3}}\sqrt{n-\frac{1}{24}}\right\}}{\sqrt{n-\frac{1}{24}}}$$

where

$$A_k(n)=\sum_{\substack{0<h\leq k\\(h,k)=1}}e^{\pi i s(h,k)}e^{-\frac{2\pi i h n}{k}}$$

$$s(h,k)=\sum_{j=1}^{k-1}\frac{j}{k}\left(\left(\frac{hj}{k}\right)\right)$$

$$\begin{aligned}((x))&=x-[x]-\tfrac{1}{2} &&\text{if } x \text{ is not an integer}\\ &=0 &&\text{if } x \text{ is an integer}\end{aligned}$$

### II. Relations

A. Recurrence

$$p(n)=\sum_{1\leq\frac{3k^2\pm k}{2}\leq n}(-1)^{k-1}p\left(n-\frac{3k^2\pm k}{2}\right) \qquad p(0)=1$$

$$=\frac{1}{n}\sum_{k=1}^{n}\sigma_1(k)p(n-k)$$

B. Check

$$p(n)+\sum_{1\leq\frac{3k^2\pm k}{2}\leq n}(-1)^k\frac{3k^2\pm k}{2}p\left(n-\frac{3k^2\pm k}{2}\right)=\sigma_1(n)$$

### III. Asymptotics

$$p(n)\sim\frac{1}{4n\sqrt{3}}e^{\pi\sqrt{2/3}\sqrt{n}}$$

### 24.2.2 Partitions Into Distinct Parts

### I. Definitions

A. $q(n)$ is the number of decompositions of $n$ into distinct integer summands without regard to order. E.g., $5=1+4=2+3$ so that $q(5)=3$.

B. Generating function

$$\sum_{n=0}^{\infty}q(n)x^n=\prod_{n=1}^{\infty}(1+x^n)=\prod_{n=1}^{\infty}(1-x^{2n-1})^{-1} \qquad |x|<1$$

C. Closed form

$$q(n)=\frac{1}{\sqrt{2}}\sum_{k=1}^{\infty}A_{2k-1}(n)\frac{d}{dn}J_0\left(\frac{\pi i}{2k-1}\sqrt{\frac{1}{3}}\sqrt{n+\frac{1}{24}}\right)$$

where $J_0(x)$ is the Bessel function of order 0 and $A_{2k-1}(n)$ was defined in part I.C. of the previous subsection.

---

*See page II.

#### II. Relations

A. Recurrences

$$\sum_{0\le\frac{3k^2\pm k}{2}\le n} (-1)^k q\left(n-\frac{3k^2\pm k}{2}\right)=(-1)^r \text{ if } n=3r^2\pm r$$

$$q(0)=1$$

$$=0 \text{ otherwise}$$

$$q(n)=\frac{1}{n}\sum_{k=1}^{n}\left\{\sigma_1(k)-2\sigma_1\left(\frac{k}{2}\right)\right\}q(n-k)$$

B. Check

$$\sum_{0\le 3k^2\pm k\le n}(-1)^k q(n-(3k^2\pm k))=1 \text{ if } n=\frac{r^2-r}{2}$$

$$=0 \text{ otherwise.}$$

#### III. Asymptotics

$$q(n)\sim\frac{1}{4\cdot 3^{1/4}\cdot n^{3/4}}e^{\pi\sqrt{1/3}\sqrt{n}}$$

## 24.3. Number Theoretic Functions

### 24.3.1 The Möbius Function

#### I. Definitions

A. $$\begin{aligned}\mu(n)&=1 && \text{if } n=1\\ &=(-1)^k && \text{if } n \text{ is the product of } k \text{ distinct primes}\\ &=0 && \text{if } n \text{ is divisible by a square} >1.\end{aligned}$$

B. Generating functions

$$\sum_{n=1}^{\infty}\mu(n)n^{-s}=1/\zeta(s) \qquad \mathscr{R}s>1$$

$$\sum_{n=1}^{\infty}\frac{\mu(n)x^n}{1-x^n}=x \qquad |x|<1$$

#### II. Relations

A. Recurrence

$$\begin{aligned}\mu(mn)&=\mu(m)\mu(n) && \text{if } (m,n)=1\\ &=0 && \text{if } (m,n)>1\end{aligned}$$

B. Check

$$\sum_{d|n}\mu(d)=\delta_{n1}$$

C. Numerical analysis

$g(n)=\sum_{d|n}f(d)$ for all $n$ if and only if

$$f(n)=\sum_{d|n}\mu(d)g(n/d) \text{ for all } n$$

$g(n)=\prod_{d|n}f(d)$ for all $n$ if and only if

$$f(n)=\prod_{d|n}g(n/d)^{\mu(d)} \text{ for all } n$$

$g(x)=\sum_{n=1}^{[x]}f(x/n)$ for all $x>0$ if and only if

$$f(x)=\sum_{n=1}^{[x]}\mu(n)g(x/n) \text{ for all } x>0$$

$g(x)=\sum_{n=1}^{\infty}f(nx)$ for all $x>0$ if and only if

$$f(x)=\sum_{n=1}^{\infty}\mu(n)g(nx) \text{ for all } x>0$$

and if $\sum_{m=1}^{\infty}\sum_{n=1}^{\infty}|f(mnx)|=\sum_{n=1}^{\infty}\sigma_0(n)|f(nx)|$ converges.

The cyclotomic polynomial of order $n$ is $\prod_{d|n}(x^d-1)^{\mu(n/d)}$

#### III. Asymptotics

$$\sum_{n=1}^{\infty}\frac{\mu(n)}{n}=0$$

$$\sum_{n=1}^{\infty}\frac{\mu(n)}{n}\ln n=-1$$

$$\sum_{n\le x}\mu(n)=0(xe^{-c\sqrt{\ln x}})$$

### 24.3.2 The Euler Totient Function

#### I. Definitions

A. $\varphi(n)$ is the number of integers not exceeding and relatively prime to $n$.

B. Generating functions

$$\sum_{n=1}^{\infty}\varphi(n)n^{-s}=\frac{\zeta(s-1)}{\zeta(s)} \qquad \mathscr{R}s>2$$

$$\sum_{n=1}^{\infty}\frac{\varphi(n)x^n}{1-x^n}=\frac{x}{(1-x)^2} \qquad |x|<1$$

C. Closed form

$$\varphi(n)=n\prod_{p|n}\left(1-\frac{1}{p}\right)$$

over distinct primes $p$ dividing $n$.

#### II. Relations

A. Recurrence

$$\varphi(mn)=\varphi(m)\varphi(n) \qquad (m,n)=1$$

B. Checks

$$\sum_{d|n}\varphi(d)=n$$

$$\varphi(n)=\sum_{d|n}\mu\left(\frac{n}{d}\right)d$$

$$a^{\varphi(n)}\equiv 1 \pmod{n} \qquad (a,n)=1$$

#### III. Asymptotics

$$\frac{1}{n^2}\sum_{k=1}^{n}\varphi(k)=\frac{3}{\pi^2}+O\left(\frac{\ln n}{n}\right)$$

### 24.3.3 Divisor Functions

#### I. Definitions

A. $\sigma_k(n)$ is the sum of the $k$-th powers of the divisors of $n$. Often $\sigma_0(n)$ is denoted by $d(n)$, and $\sigma_1(n)$ by $\sigma(n)$.

B. Generating functions

$$\sum_{n=1}^{\infty} \sigma_k(n) n^{-s} = \zeta(s)\zeta(s-k) \qquad \mathscr{R}s > k+1$$

$$\sum_{n=1}^{\infty} \sigma_k(n) x^n = \sum_{n=1}^{\infty} \frac{n^k x^n}{1-x^n} \qquad |x|<1$$

C. Closed form

$$\sigma_k(n) = \sum_{d|n} d^k = \prod_{i=1}^{s} \frac{p_i^{k(a_i+1)}-1}{p_i^k-1} \qquad n = p_1^{a_1} p_2^{a_2} \ldots p_s^{a_s}$$

#### II. Relations

A. Recurrences

$$\sigma_k(mn) = \sigma_k(m)\sigma_k(n) \qquad (m, n)=1$$

$$\sigma_k(np) = \sigma_k(n)\sigma_k(p) - p^k \sigma_k(n/p) \qquad p \text{ prime}$$

#### III. Asymptotics

$$\frac{1}{n}\sum_{m=1}^{n} \sigma_0(m) = \ln n + 2\gamma - 1 + O(n^{-\frac{1}{2}})$$

($\gamma$=Euler's constant)

$$\frac{1}{n^2}\sum_{m=1}^{n} \sigma_1(m) = \frac{\pi^2}{12} + O\left(\frac{\ln n}{n}\right)$$

### 24.3.4 Primitive Roots

#### I. Definitions

The integers not exceeding and relatively prime to a fixed integer $n$ form a group; the group is cyclic if and only if $n=2$, 4 or $n$ is of the form $p^k$ or $2p^k$ where $p$ is an odd prime. Then $g$ is a primitive root of $n$ if it generates that group; i.e., if $g, g^2, \ldots, g^{\varphi(n)}$ are distinct modulo $n$. There are $\varphi(\varphi(n))$ primitive roots of $n$.

#### II. Relations

A. Recurrences. If $g$ is a primitive root of a prime $p$ and $g^{p-1} \not\equiv 1 \pmod{p^2}$ then $g$ is a primitive root of $p^k$ for all $k$. If $g^{p-1} \equiv 1 \pmod{p^2}$ then $g+p$ is a primitive root of $p^k$ for all $k$.

If $g$ is a primitive root of $p^k$ then either $g$ or $g+p^k$, whichever is odd, is a primitive root of $2p^k$.

B. Checks. If $g$ is a primitive root of $n$ then $g^k$ is a primitive root of $n$ if and only if $(k, \varphi(n))=1$, and each primitive root of $n$ is of this form.

## Table 24.8 Primitive Roots, Factorization of $p-1$

$g$, G denote the least positive and least negative (respectively) primitive roots of $p$. $\epsilon$ denotes whether 10, −10 both or neither are primitive roots.

| $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ |

## Primitive Roots, Factorization of $p-1$ Table 24.8

$g$, G denote the least positive and least negative (respectively) primitive roots of $p$. $\epsilon$ denotes whether 10, −10 both or neither are primitive roots.

| $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ |

## Primitive Roots, Factorization of $p-1$ Table 24.8

$g$, G denote the least positive and least negative (respectively) primitive roots of $p$. $\epsilon$ denotes whether 10, −10 both or neither are primitive roots.

| $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ |

**Table 24.8** **Primitive Roots, Factorization of $p-1$**

$g$, G denote the least positive and least negative (respectively) primitive roots of $p$. $\epsilon$ denotes whether 10, −10 both or neither are primitive roots.

| $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ |

## Primitive Roots, Factorization of $p-1$ Table 24.8

$g$, G denote the least positive and least negative (respectively) primitive roots of $p$. $\epsilon$ denotes whether 10, −10 both or neither are primitive roots.

| $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ | $p$ | $p-1$ | $g$ | $-G$ | $\epsilon$ |

# 25. Numerical Interpolation, Differentiation, and Integration

Numerical analysts have a tendency to accumulate a multiplicity of tools each designed for highly specialized operations and each requiring special knowledge to use properly. From the vast stock of formulas available we have culled the present selection. We hope that it will be useful. As with all such compendia, the reader may miss his favorites and find others whose utility he thinks is marginal.

We would have liked to give examples to illuminate the formulas, but this has not been feasible. Numerical analysis is partially a science and partially an art, and short of writing a textbook on the subject it has been impossible to indicate where and under what circumstances the various formulas are useful or accurate, or to elucidate the numerical difficulties to which one might be led by uncritical use. The formulas are therefore issued together with a caveat against their blind application.

## Formulas

*Notation:* Abscissas: $x_0<x_1<\ldots$; functions: $f, g, \ldots$; values: $f(x_i)=f_i, f'(x_i)=f'_i$. $f', f^{(2)}, \ldots$ indicate 1st, 2d, . . . derivatives. If abscissas are equally spaced, $x_{i+1}-x_i=h$ and $f_p=f(x_0+ph)$ ($p$ not necessarily integral). $R$, $R_n$ indicate remainders.

### 25.1. Differences

**Forward Differences**

**25.1.1**

$$\Delta(f_n)=\Delta_n=\Delta_n^1=f_{n+1}-f_n$$

$$\Delta_n^2=\Delta_{n+1}^1-\Delta_n^1=f_{n+2}-2f_{n+1}+f_n$$

$$\Delta_n^3=\Delta_{n+1}^2-\Delta_n^2=f_{n+3}-3f_{n+2}+3f_{n+1}-f_n$$

$$\Delta_n^k=\Delta_{n+1}^{k-1}-\Delta_n^{k-1}=\sum_{j=0}^{k}(-1)^j\binom{k}{j}f_{n+k-j}$$

**Central Differences**

**25.1.2**

$$\delta(f_{n+\frac{1}{2}})=\delta_{n+\frac{1}{2}}=\delta_{n+\frac{1}{2}}^1=f_{n+1}-f_n$$

$$\delta_n^2=\delta_{n+\frac{1}{2}}^1-\delta_{n-\frac{1}{2}}^1=f_{n+1}-2f_n+f_{n-1}$$

$$\delta_{n+\frac{1}{2}}^3=\delta_{n+1}^2-\delta_n^2=f_{n+2}-3f_{n+1}+3f_n-f_{n-1}$$

$$\delta_n^{2k}=\sum_{j=0}^{2k}(-1)^j\binom{2k}{j}f_{n+k-j}$$

$$\delta_{n+\frac{1}{2}}^{2k+1}=\sum_{j=0}^{2k+1}(-1)^j\binom{2k+1}{j}f_{n+k+1-j}$$

$\delta_{\frac{1}{2}n}^k=\Delta_{\frac{1}{2}(n-k)}^k$ if $n$ and $k$ are of same parity.

*Forward Differences*

$$\begin{array}{lllll}
x_0 & f_0 & & & \\
 & & \Delta_0 & & \\
x_1 & f_1 & & \Delta_0^2 & \\
 & & \Delta_1 & & \Delta_0^3 \\
x_2 & f_2 & & \Delta_1^2 & \\
 & & \Delta_2 & & \\
x_3 & f_3 & & &
\end{array}$$

*Central Differences*

$$\begin{array}{lllll}
x_{-1} & f_{-1} & & & \\
 & & \delta_{-\frac{1}{2}} & & \\
x_0 & f_0 & & \delta_0^2 & \\
 & & \delta_{\frac{1}{2}} & & \delta_{\frac{1}{2}}^3 \\
x_1 & f_1 & & \delta_1^2 & \\
 & & \delta_{3/2} & & \\
x_2 & f_2 & & &
\end{array}$$

**Mean Differences**

**25.1.3** $\mu(f_n)=\frac{1}{2}(f_{n+\frac{1}{2}}+f_{n-\frac{1}{2}})$

**Divided Differences**

**25.1.4** $[x_0,x_1]=\dfrac{f_0-f_1}{x_0-x_1}=[x_1,x_0]$

$$[x_0,x_1,x_2]=\frac{[x_0,x_1]-[x_1,x_2]}{x_0-x_2}$$

$$[x_0,x_1,\ldots,x_k]=\frac{[x_0,\ldots,x_{k-1}]-[x_1,\ldots,x_k]}{x_0-x_k}$$

**Divided Differences in Terms of Functional Values**

**25.1.5** $[x_0,x_1,\ldots,x_n]=\sum_{k=0}^{n}\dfrac{f_k}{\pi_n'(x_k)}$

**25.1.6** where $\pi_n(x)=(x-x_0)\ (x-x_1)\ \ldots\ (x-x_n)$ and $\pi_n'(x)$ is its derivative:

**25.1.7**

$$\pi_n'(x_k)=(x_k-x_0)\ \ldots\ (x_k-x_{k-1})(x_k-x_{k+1})\ \ldots\ (x_k-x_n)$$

Let $D$ be a simply connected domain with a piecewise smooth boundary $C$ and contain the points $z_0, \ldots, z_n$ in its interior. Let $f(z)$ be analytic in $D$ and continuous in $D+C$. Then,

**25.1.8** $$[z_0,z_1,\ldots,z_n]=\frac{1}{2\pi i}\int_C \frac{f(z)}{\prod\limits_{k=0}^{n}(z-z_k)}\,dz$$

**25.1.9** $$\Delta_0^n=h^nf^{(n)}(\xi)\qquad (x_0<\xi<x_n)$$

**25.1.10**

$$[x_0,x_1,\ldots,x_n]=\frac{\Delta_0^n}{n!h^n}=\frac{f^{(n)}(\xi)}{n!}\qquad (x_0<\xi<x_n)$$

**25.1.11**

$$[x_{-n},x_{-n+1},\ldots,x_0,\ldots,x_n]=\frac{\delta_0^{2n}}{h^{2n}(2n)!}$$

### Reciprocal Differences

**25.1.12**

$$\rho(x_0,x_1)=\frac{x_0-x_1}{f_0-f_1}$$

$$\rho_2(x_0,x_1,x_2)=\frac{x_0-x_2}{\rho(x_0,x_1)-\rho(x_1,x_2)}+f_1$$

$$\rho_3(x_0,x_1,x_2,x_3)=\frac{x_0-x_3}{\rho_2(x_0,x_1,x_2)-\rho_2(x_1,x_2,x_3)}+\rho(x_1,x_2)$$

$$\vdots$$

$$\rho_n(x_0,x_1,\ldots,x_n)=\frac{x_0-x_n}{\rho_{n-1}(x_0,\ldots,x_{n-1})-\rho_{n-1}(x_1,\ldots,x_n)}+\rho_{n-2}(x_1,\ldots,x_{n-1})$$

## 25.2. Interpolation

### Lagrange Interpolation Formulas

**25.2.1** $$f(x)=\sum_{i=0}^{n} l_i(x)f_i+R_n(x)$$

**25.2.2**

$$l_i(x)=\frac{\pi_n(x)}{(x-x_i)\pi_n'(x_i)}=\frac{(x-x_0)\ldots(x-x_{i-1})(x-x_{i+1})\ldots(x-x_n)}{(x_i-x_0)\ldots(x_i-x_{i-1})(x_i-x_{i+1})\ldots(x_i-x_n)}$$

### Remainder in Lagrange Interpolation Formula

**25.2.3**

$$R_n(x)=\pi_n(x)\cdot[x_0,x_1,\ldots,x_n,x]=\pi_n(x)\cdot\frac{f^{n+1}(\xi)}{(n+1)!}\qquad (x_0<\xi<x_n)$$

**25.2.4**

$$|R_n(x)|\le\frac{(x_n-x_0)^{n+1}}{(n+1)!}\max_{x_0\le x\le x_n}|f^{(n+1)}(x)|$$

**25.2.5**

$$R_n(z)=\frac{\pi_n(z)}{2\pi i}\int_C\frac{f(t)}{(t-z)(t-z_0)\ldots(t-z_n)}\,dt$$

The conditions of **25.1.8** are assumed here.

### Lagrange Interpolation, Equally Spaced Abscissas

### $n$ Point Formula

**25.2.6** $$f(x_0+ph)=\sum_k A_k^n(p)f_k+R_{n-1}$$

For $n$ even, $\left(-\frac{1}{2}(n-2)\le k\le\frac{1}{2}n\right)$.

For $n$ odd, $\left(-\frac{1}{2}(n-1)\le k\le\frac{1}{2}(n-1)\right)$.

**25.2.7**

$$A_k^n(p)=\frac{(-1)^{\frac{1}{2}n+k}}{\left(\frac{n-2}{2}+k\right)!(\frac{1}{2}n-k)!(p-k)}\prod_{t=1}^{n}(p+\tfrac{1}{2}n-t)\qquad n \text{ even.}$$

$$A_k^n(p)=\frac{(-1)^{\frac{1}{2}(n-1)+k}}{\left(\frac{n-1}{2}+k\right)!\left(\frac{n-1}{2}-k\right)!(p-k)}\prod_{t=0}^{n-1}\left(p+\frac{n-1}{2}-t\right),\qquad n \text{ odd.}$$

**25.2.8**

$$R_{n-1}=\frac{1}{n!}\prod_k(p-k)h^nf^{(n)}(\xi)\approx\frac{1}{n!}\prod_k(p-k)\Delta_0^n\qquad (x_0<\xi<x_n)$$

$k$ has the same range as in **25.2.6.**

### Lagrange Two Point Interpolation Formula (Linear Interpolation)

**25.2.9** $$f(x_0+ph)=(1-p)f_0+pf_1+R_1$$

**25.2.10** $$R_1(p)\approx .125h^2f^{(2)}(\xi)\approx .125\Delta^2$$

### Lagrange Three Point Interpolation Formula

**25.2.11**

$$f(x_0+ph)=A_{-1}f_{-1}+A_0f_0+A_1f_1+R_2$$
$$\approx\frac{p(p-1)}{2}f_{-1}+(1-p^2)f_0+\frac{p(p+1)}{2}f_1$$

**25.2.12**

$$R_2(p)\approx .065h^3f^{(3)}(\xi)\approx .065\Delta^3\qquad(|p|\leq 1)$$

### Lagrange Four Point Interpolation Formula

**25.2.13**

$$f(x_0+ph)=A_{-1}f_{-1}+A_0f_0+A_1f_1+A_2f_2+R_3$$
$$\approx\frac{-p(p-1)(p-2)}{6}f_{-1}+\frac{(p^2-1)(p-2)}{2}f_0$$
$$-\frac{p(p+1)(p-2)}{2}f_1+\frac{p(p^2-1)}{6}f_2$$

**25.2.14** $R_3(p)\approx$

$$\begin{array}{ll} .024h^4f^{(4)}(\xi)\approx .024\Delta^4 & (0<p<1)\\ .042h^4f^{(4)}(\xi)\approx .042\Delta^4 & (-1<p<0,\ 1<p<2)\\ & (x_{-1}<\xi<x_2)\end{array}$$

### Lagrange Five Point Interpolation Formula

**25.2.15**

$$f(x_0+ph)=\sum_{i=-2}^{2}A_if_i+R_4$$
$$\approx\frac{(p^2-1)p(p-2)}{24}f_{-2}-\frac{(p-1)p(p^2-4)}{6}f_{-1}$$
$$+\frac{(p^2-1)(p^2-4)}{4}f_0-\frac{(p+1)p(p^2-4)}{6}f_1$$
$$+\frac{(p^2-1)p(p+2)}{24}f_2$$

**25.2.16** $R_4(p)\approx$

$$\begin{array}{lll} .012h^5f^{(5)}(\xi)\approx .012\Delta^5 & (|p|<1) & \\ .031h^5f^{(5)}(\xi)\approx .031\Delta^5 & (1<|p|<2) & (x_{-2}<\xi<x_2)\end{array}$$

### Lagrange Six Point Interpolation Formula

**25.2.17**

$$f(x_0+ph)=\sum_{i=-2}^{3}A_if_i+R_5$$
$$\approx\frac{-p(p^2-1)(p-2)(p-3)}{120}f_{-2}$$
$$+\frac{p(p-1)(p^2-4)(p-3)}{24}f_{-1}$$
$$-\frac{(p^2-1)(p^2-4)(p-3)}{12}f_0$$
$$+\frac{p(p+1)(p^2-4)(p-3)}{12}f_1-\frac{p(p^2-1)(p+2)(p-3)}{24}f_2$$
$$+\frac{p(p^2-1)(p^2-4)}{120}f_3$$

**25.2.18** $R_5(p)\approx$

$$\begin{array}{ll} .0049h^6f^{(6)}(\xi)\approx .0049\Delta^6 & (0<p<1)\\ .0071h^6f^{(6)}(\xi)\approx .0071\Delta^6 & (-1<p<0,\ 1<p<2)\\ .024h^6f^{(6)}(\xi)\approx .024\Delta^6 & (-2<p<-1,\ 2<p<3)\\ & (x_{-2}<\xi<x_3)\end{array}$$

### Lagrange Seven Point Interpolation Formula

**25.2.19** $$f(x_0+ph)=\sum_{i=-3}^{3}A_if_i+R_6$$

**25.2.20**

$$R_6(p)\approx\begin{cases} .0025h^7f^{(7)}(\xi)\approx .0025\Delta^7 & (|p|<1)\\ .0046h^7f^{(7)}(\xi)\approx .0046\Delta^7 & (1<|p|<2)\\ .019h^7f^{(7)}(\xi)\approx .019\Delta^7 & (2<|p|<3)\end{cases}$$
$$(x_{-3}<\xi<x_3)$$

### Lagrange Eight Point Interpolation Formula

**25.2.21** $$f(x_0+ph)=\sum_{i=-3}^{4}A_if_i+R_7$$

**25.2.22**

$$R_7(p)\approx\begin{cases} .0011h^8f^{(8)}(\xi)\approx .0011\Delta^8 & (0<p<1)\\ .0014h^8f^{(8)}(\xi)\approx .0014\Delta^8 & (-1<p<0)\ (1<p<2)\\ .0033h^8f^{(8)}(\xi)\approx .0033\Delta^8 & (-2<p<-1)\ (2<p<3)\\ .016h^8f^{(8)}(\xi)\approx .016\Delta^8 & (-3<p<-2)\ (3<p<4)\end{cases}$$
$$(x_{-3}<\xi<x_4)$$

### Aitken's Iteration Method

Let $f(x|x_0,x_1,\ldots,x_k)$ denote the unique polynomial of $k^{\text{th}}$ degree which coincides in value with $f(x)$ at $x_0,\ldots,x_k$.

**25.2.23**

$$f(x|x_0,x_1)=\frac{1}{x_1-x_0}\begin{vmatrix} f_0 & x_0-x\\ f_1 & x_1-x\end{vmatrix}$$

$$f(x|x_0,x_2)=\frac{1}{x_2-x_0}\begin{vmatrix} f_0 & x_0-x\\ f_2 & x_2-x\end{vmatrix}$$

$$f(x|x_0,x_1,x_2)=\frac{1}{x_2-x_1}\begin{vmatrix} f(x|x_0,x_1) & x_1-x\\ f(x|x_0,x_2) & x_2-x\end{vmatrix}$$

$$f(x|x_0,x_1,x_2,x_3)=\frac{1}{x_3-x_2}\begin{vmatrix} f(x|x_0,x_1,x_2) & x_2-x\\ f(x|x_0,x_1,x_3) & x_3-x\end{vmatrix}$$

### Taylor Expansion

**25.2.24**

$$f(x)=f_0+(x-x_0)f'_0+\frac{(x-x_0)^2}{2!}f_0^{(2)}+\ldots+\frac{(x-x_0)^n}{n!}f_0^{(n)}+R_n$$

**25.2.25**
$$R_n=\int_{x_0}^{x}f^{(n+1)}(t)\,\frac{(x-t)^n}{n!}\,dt=\frac{(x-x_0)^{n+1}}{(n+1)!}f^{(n+1)}(\xi)\qquad(x_0<\xi<x)$$

### Newton's Divided Difference Interpolation Formula

**25.2.26**

$$f(x)=f_0+\sum_{k=1}^{n}\pi_{k-1}(x)\,[x_0,x_1,\ldots,x_k]+R_n$$

$$\begin{array}{llllll}
x_0 & f_0 & & & \\
 & & [x_0,x_1] & & \\
x_1 & f_1 & & [x_0,x_1,x_2] & \\
 & & [x_1,x_2] & & [x_0,x_1,x_2,x_3] \\
x_2 & f_2 & & [x_1,x_2,x_3] & \\
 & & [x_2,x_3] & & \\
x_3 & f_3 & & &
\end{array}$$

**25.2.27**

$$R_n(x)=\pi_n(x)\,[x_0,\ldots,x_n,x]=\pi_n(x)\frac{f^{(n+1)}(\xi)}{(n+1)!}\qquad(x_0<\xi<x_n)$$

(For $\pi_n$ see **25.1.6.**)

### Newton's Forward Difference Formula

**25.2.28**

$$f(x_0+ph)=f_0+p\Delta_0+\binom{p}{2}\Delta_0^2+\ldots+\binom{p}{n}\Delta_0^n+R_n$$

$$\begin{array}{lllll}
x_0 & f_0 & & & \\
 & & \Delta_0 & & \\
x_1 & f_1 & & \Delta_0^2 & \\
 & & \Delta_1 & & \Delta_0^3 \\
x_2 & f_2 & & \Delta_1^2 & \\
 & & \Delta_2 & & \\
x_3 & f_3 & & &
\end{array}$$

**25.2.29**

$$R_n=h^{n+1}\binom{p}{n+1}f^{(n+1)}(\xi)\approx\binom{p}{n+1}\Delta_0^{n+1}\qquad(x_0<\xi<x_n)$$

### Relation Between Newton and Lagrange Coefficients

**25.2.30**

$$\binom{p}{2}=A_{-1}^{3}(p)\qquad\binom{p}{3}=-A_{-1}^{4}(p)\qquad\binom{p}{4}=A_{2}^{5}(1-p)$$

$$\binom{p}{5}=A_{3}^{6}(2-p)$$

### Everett's Formula

**25.2.31**

$$\begin{aligned}f(x_0+ph)&=(1-p)f_0+pf_1-\frac{p(p-1)(p-2)}{3!}\delta_0^2\\&\quad+\frac{(p+1)p(p-1)}{3!}\delta_1^2+\ldots-\binom{p+n-1}{2n+1}\delta_0^{2n}\\&\quad+\binom{p+n}{2n+1}\delta_1^{2n}+R_{2n}\\&=(1-p)f_0+pf_1+E_2\delta_0^2+F_2\delta_1^2+E_4\delta_0^4\\&\qquad+F_4\delta_1^4+\ldots+R_{2n}\end{aligned}$$

$$\begin{array}{lllll}
x_0 & f_0 & \delta_0^2 & \delta_0^4 \\
 & & \delta_{\frac12} & \delta_{\frac12}^3 \\
x_1 & f_1 & \delta_1^2 & \delta_1^4
\end{array}$$

**25.2.32**

$$R_{2n}=h^{2n+2}\binom{p+n}{2n+2}f^{(2n+2)}(\xi)$$

$$\approx\binom{p+n}{2n+2}\left[\frac{\Delta_{-n-1}^{2n+2}+\Delta_{-n}^{2n+2}}{2}\right]\qquad(x_{-n}<\xi<x_{n+1})$$

### Relation Between Everett and Lagrange Coefficients

**25.2.33**

$$E_2=A_{-1}^{4}\qquad E_4=A_{-2}^{6}\qquad E_6=A_{-3}^{8}$$

$$F_2=A_{2}^{4}\qquad F_4=A_{3}^{6}\qquad F_6=A_{4}^{8}$$

### Everett's Formula With Throwback
### (Modified Central Difference)

**25.2.34**

$$f(x_0+ph)=(1-p)f_0+pf_1+E_2\delta_{m,0}^2+F_2\delta_{m,1}^2+R$$

**25.2.35** $$\delta_m^2=\delta^2-.184\delta^4$$

**25.2.36** $$R\approx.00045|\mu\delta_{\frac12}^4|+.00061|\delta_{\frac12}^5|$$

**25.2.37**

$$f(x_0+ph)=(1-p)f_0+pf_1+E_2\delta_0^2+F_2\delta_1^2+E_4\delta_{m,0}^4+F_4\delta_{m,1}^4+R$$

**25.2.38** $$\delta_m^4=\delta^4-.207\delta^6+\ldots$$

**25.2.39** $$R\approx.000032|\mu\delta_{\frac12}^6|+.000052|\delta_{\frac12}^7|$$

**25.2.40**

$$\begin{aligned}f(x_0+ph)&=(1-p)f_0+pf_1+E_2\delta_0^2+F_2\delta_1^2\\&\quad+E_4\delta_0^4+F_4\delta_1^4+E_6\delta_{m,0}^6+F_6\delta_{m,1}^6+R\end{aligned}$$

**25.2.41** $$\delta_m^6=\delta^6-.218\delta^8+.049\delta^{10}+\ldots$$

**25.2.42** $$R\approx.0000037|\mu\delta_{\frac12}^8|+\ldots$$

### Simultaneous Throwback

**25.2.43**

$$f(x_0+ph)=(1-p)f_0+pf_1+E_2\delta^2_{m,0}+F_2\delta^2_{m,1}+E_4\delta^4_{m,0}+F_4\delta^4_{m,1}+R$$

**25.2.44** $$\delta^2_m=\delta^2-.01312\delta^6+.0043\delta^8-.001\delta^{10}$$

**25.2.45** $$\delta^4_m=\delta^4-.27827\delta^6+.0685\delta^8-.016\delta^{10}$$

**25.2.46** $$R\approx.00000083|\mu\delta^6_{\frac{1}{2}}|+.0000094\delta^7$$

### Bessel's Formula With Throwback

**25.2.47**

$$f(x_0+ph)=(1-p)f_0+pf_1+B_2(\delta^2_{m,0}+\delta^2_{m,1})+B_3\delta^3_{\frac{1}{2}}+R,\ B_2=\frac{p(p-1)}{4},\ B_3=\frac{p(p-1)\,(p-\frac{1}{2})}{6}$$

**25.2.48** $$\delta^2_m=\delta^2-.184\delta^4$$

**25.2.49** $$R\approx.00045|\mu\delta^4_{\frac{1}{2}}|+.00087|\delta^5_{\frac{1}{2}}|$$

### Thiele's Interpolation Formula

**25.2.50**

$$f(x)=f(x_1)+\cfrac{x-x_1}{\rho(x_1,x_2)+\cfrac{x-x_2}{\rho_2(x_1,x_2,x_3)-f(x_1)+\cfrac{x-x_3}{\left(\begin{matrix}\rho_3(x_1,x_2,x_3,x_4)\\ -\rho(x_1,x_2)+\ldots\end{matrix}\right)}}}$$

(For reciprocal differences, $\rho$, see **25.1.12.**)

## Trigonometric Interpolation

### Gauss' Formula

**25.2.51** $$f(x)\approx\sum_{k=0}^{2n}f_k\zeta_k(x)=t_n(x)$$

**25.2.52**

$$\zeta_k(x)=\frac{\sin\frac{1}{2}(x-x_0)\ldots\sin\frac{1}{2}(x-x_{k-1})}{\sin\frac{1}{2}(x_k-x_0)\ldots\sin\frac{1}{2}(x_k-x_{k-1})}\,\frac{\sin\frac{1}{2}(x-x_{k+1})\ldots\sin\frac{1}{2}(x-x_{2n})}{\sin\frac{1}{2}(x_k-x_{k+1})\ldots\sin\frac{1}{2}(x_k-x_{2n})}$$

$t_n(x)$ is a trigonometric polynomial of degree $n$ such that $t_n(x_k)=f_k \quad (k=0,1,\ldots,2n)$

### Harmonic Analysis

Equally spaced abscissas

$$x_0=0,\qquad x_1,\ldots,x_{m-1},x_m=2\pi$$

**25.2.53**

$$f(x)\approx\frac{1}{2}a_0+\sum_{k=1}^{n}(a_k\cos kx+b_k\sin kx)$$

**25.2.54** $$m=2n+1$$

$$a_k=\frac{2}{2n+1}\sum_{r=0}^{2n}f_r\cos kx_r;\qquad b_k=\frac{2}{2n+1}\sum_{r=0}^{2n}f_r\sin kx_r$$

$$(k=0,1,\ldots,n)$$

**25.2.55** $$m=2n$$

$$a_k=\frac{1}{n}\sum_{r=0}^{2n-1}f_r\cos kx_r;\qquad b_k=\frac{1}{n}\sum_{r=0}^{2n-1}f_r\sin kx_r$$

$$(k=0,1,\ldots,n)\qquad (k=0,1,\ldots,n-1)$$

$b_n$ is arbitrary.

### Subtabulation

Let $f(x)$ be tabulated initially in intervals of width $h$. It is desired to subtabulate $f(x)$ in intervals of width $h/m$. Let $\Delta$ and $\overline{\Delta}$ designate differences with respect to the original and the final intervals respectively. Thus $\overline{\Delta}_0=f\left(x_0+\frac{h}{m}\right)-f(x_0)$. Assuming that the original 5th order differences are zero,

**25.2.56**

$$\overline{\Delta}_0=\frac{1}{m}\Delta_0+\frac{1-m}{2m^2}\Delta^2_0+\frac{(1-m)(1-2m)}{6m^3}\Delta^3_0+\frac{(1-m)(1-2m)(1-3m)}{24m^4}\Delta^4_0$$

$$\overline{\Delta}^2_0=\frac{1}{m^2}\Delta^2_0+\frac{1-m}{m^3}\Delta^3_0+\frac{(1-m)(7-11m)}{12m^4}\Delta^4_0$$

$$\overline{\Delta}^3_0=\frac{1}{m^3}\Delta^3_0+\frac{3(1-m)}{2m^4}\Delta^4_0$$

$$\overline{\Delta}^4_0=\frac{1}{m^4}\Delta^4_0$$

From this information we may construct the final tabulation by addition. For $m=10$,

**25.2.57**

$$\overline{\Delta}_0=.1\Delta_0-.045\Delta^2_0+.0285\Delta^3_0-.02066\Delta^4_0$$

$$\overline{\Delta}^2_0=.01\Delta^2_0-.009\Delta^3_0+.007725\Delta^4_0$$

$$\overline{\Delta}^3_0=.001\Delta^3_0-.00135\Delta^4_0$$

$$\overline{\Delta}^4_0=.0001\Delta^4_0$$

### Linear Inverse Interpolation

Find $p$, given $f_p(=f(x_0+ph))$.

### Linear

**25.2.58** $$p\approx\frac{f_p-f_0}{f_1-f_0}$$

### Quadratic Inverse Interpolation

**25.2.59**

$$(f_1-2f_0+f_{-1})p^2+(f_1-f_{-1})p+2(f_0-f_p)\approx 0$$

### Inverse Interpolation by Reversion of Series

**25.2.60** Given $f(x_0+ph)=f_p=\sum_{k=0}^{\infty} a_k p^k$

**25.2.61**

$$p=\lambda+c_2\lambda^2+c_3\lambda^3+\ .\ .\ .,\ \lambda=(f_p-a_0)/a_1$$

**25.2.62**

$$c_2=-a_2/a_1$$

$$c_3=\frac{-a_3}{a_1}+2\left(\frac{a_2}{a_1}\right)^2$$

$$c_4=\frac{-a_4}{a_1}+\frac{5a_2a_3}{a_1^2}-\frac{5a_2^3}{a_1^3}$$

$$c_5=\frac{-a_5}{a_1}+\frac{6a_2a_4}{a_1^2}+\frac{3a_3^2}{a_1^2}-\frac{21a_2^2a_3}{a_1^3}+\frac{14a_2^4}{a_1^4}$$

### Inversion of Newton's Forward Difference Formula

**25.2.63**

$$a_0=f_0$$

$$a_1=\Delta_0-\frac{\Delta_0^2}{2}+\frac{\Delta_0^3}{3}-\frac{\Delta_0^4}{4}+\ .\ .\ .$$

$$a_2=\frac{\Delta_0^2}{2}-\frac{\Delta_0^3}{2}+\frac{11\Delta_0^4}{24}+\ .\ .\ .$$

$$a_3=\frac{\Delta_0^3}{6}-\frac{\Delta_0^4}{4}+\ .\ .\ .$$

$$a_4=\frac{\Delta_0^4}{24}+\ .\ .\ .$$

(Used in conjunction with **25.2.62.**)

### Inversion of Everett's Formula

**25.2.64**

$$a_0=f_0$$

$$a_1=\delta_{\frac{1}{2}}-\frac{\delta_0^2}{3}-\frac{\delta_1^2}{6}+\frac{\delta_0^4}{20}+\frac{\delta_1^4}{30}+\ .\ .\ .$$

$$a_2=\frac{\delta_0^2}{2}-\frac{\delta_0^4}{24}+\ .\ .\ .$$

$$a_3=\frac{-\delta_0^2+\delta_1^2}{6}-\frac{\delta_0^4+\delta_1^4}{24}+\ .\ .\ .$$

$$a_4=\frac{\delta_0^4}{24}+\ .\ .\ .$$

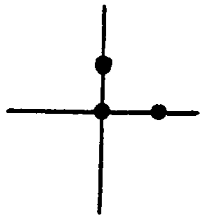
$$a_5=\frac{-\delta_0^4+\delta_1^4}{120}+\ .\ .\ .$$

(Used in conjunction with **25.2.62.**)

## Bivariate Interpolation

### Three Point Formula (Linear)

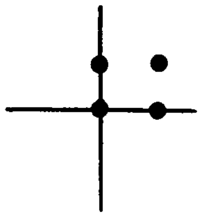
**25.2.65**



$$f(x_0+ph,y_0+qk)=(1-p-q)f_{0,0}+pf_{1,0}+qf_{0,1}+O(h^2)$$

### Four Point Formula

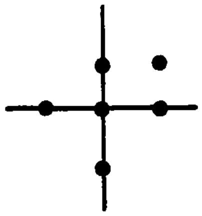
**25.2.66**



$$f(x_0+ph,y_0+qk)=(1-p)(1-q)f_{0,0}+p(1-q)f_{1,0}+q(1-p)f_{0,1}+pqf_{1,1}+O(h^2)$$

### Six Point Formula

**25.2.67**



$$f(x_0+ph,y_0+qk)=\frac{q(q-1)}{2}f_{0,-1}+\frac{p(p-1)}{2}f_{-1,0}$$

$$+(1+pq-p^2-q^2)f_{0,0}$$

$$+\frac{p(p-2q+1)}{2}f_{1,0}$$

$$+\frac{q(q-2p+1)}{2}f_{0,1}+pqf_{1,1}+O(h^3)$$

## 25.3. Differentiation

### Lagrange's Formula

**25.3.1** $$f'(x)=\sum_{k=0}^{n} l_k'(x)f_k+R_n'(x)$$

(See **25.2.1.**)

**25.3.2** $$l_k'(x)=\sum_{\substack{j=0\\ j\neq k}}^{n}\frac{\pi_n(x)}{(x-x_k)(x-x_j)\pi_n'(x_k)}$$

**25.3.3**

$$R_n'(x)=\frac{f^{(n+1)}}{(n+1)!}(\xi)\pi_n'(x)+\frac{\pi_n(x)}{(n+1)!}\frac{d}{dx}f^{(n+1)}(\xi)$$

$$\xi=\xi(x)\quad(x_0<\xi<x_n)$$

## Equally Spaced Abscissas

### Three Points

**25.3.4**

$$f_p'=f'(x_0+ph)$$

$$=\frac{1}{h}\{(p-\tfrac{1}{2})f_{-1}-2pf_0+(p+\tfrac{1}{2})f_1\}+R_2'$$

### Four Points

**25.3.5**

$$f_p'=f'(x_0+ph)=\frac{1}{h}\left\{-\frac{3p^2-6p+2}{6}f_{-1}+\frac{3p^2-4p-1}{2}f_0-\frac{3p^2-2p-2}{2}f_1+\frac{3p^2-1}{6}f_2\right\}+R_3'$$

### Five Points

**25.3.6**

$$f_p'=f'(x_0+ph)=\frac{1}{h}\left\{\frac{2p^3-3p^2-p+1}{12}f_{-2}-\frac{4p^3-3p^2-8p+4}{6}f_{-1}+\frac{2p^3-5p}{2}f_0-\frac{4p^3+3p^2-8p-4}{6}f_1+\frac{2p^3+3p^2-p-1}{12}f_2\right\}+R_4'$$

For numerical values of differentiation coefficients see **Table 25.2**.

### Markoff's Formulas

### (Newton's Forward Difference Formula Differentiated)

**25.3.7**

$$f'(a_0+ph)=\frac{1}{h}\left[\Delta_0+\frac{2p-1}{2}\Delta_0^2+\frac{3p^2-6p+2}{6}\Delta_0^3+\ldots+\frac{d}{dp}\binom{p}{n}\Delta_0^n\right]+R_n'$$

**25.3.8**

$$R_n'=h^nf^{(n+1)}(\xi)\frac{d}{dp}\binom{p}{n+1}+h^{n+1}\binom{p}{n+1}\frac{d}{dx}f^{(n+1)}(\xi)$$

$$(a_0<\xi<a_n)$$

**25.3.9** $$hf_0'=\Delta_0-\frac{1}{2}\Delta_0^2+\frac{1}{3}\Delta_0^3-\frac{1}{4}\Delta_0^4+\ldots$$

**25.3.10** $$h^2f_0^{(2)}=\Delta_0^2-\Delta_0^3+\frac{11}{12}\Delta_0^4-\frac{5}{6}\Delta_0^5+\ldots$$

**25.3.11**

$$h^3f_0^{(3)}=\Delta_0^3-\frac{3}{2}\Delta_0^4+\frac{7}{4}\Delta_0^5-\frac{15}{8}\Delta_0^6+\ldots$$

**25.3.12**

$$h^4f_0^{(4)}=\Delta_0^4-2\Delta_0^5+\frac{17}{6}\Delta_0^6-\frac{7}{2}\Delta_0^7+\ldots$$

**25.3.13**

$$h^5f_0^{(5)}=\Delta_0^5-\frac{5}{2}\Delta_0^6+\frac{25}{6}\Delta_0^7-\frac{35}{6}\Delta_0^8+\ldots$$

### Everett's Formula

**25.3.14**

$$hf'(x_0+ph)\approx-f_0+f_1-\frac{3p^2-6p+2}{6}\delta_0^2+\frac{3p^2-1}{6}\delta_1^2-\frac{5p^4-20p^3+15p^2+10p-6}{120}\delta_0^4+\frac{5p^4-15p^2+4}{120}\delta_1^4+\ldots-\left[\binom{p+n-1}{2n+1}\right]'\delta_0^{2n}+\left[\binom{p+n}{2n+1}\right]'\delta_1^{2n}$$

**25.3.15**

$$hf_0'\approx-f_0+f_1-\frac{1}{3}\delta_0^2-\frac{1}{6}\delta_1^2+\frac{1}{20}\delta_0^4+\frac{1}{30}\delta_1^4$$

### Differences in Terms of Derivatives

**25.3.16**

$$\Delta_0\approx hf_0'+\frac{h^2}{2!}f_0^{(2)}+\frac{h^3}{3!}f_0^{(3)}+\frac{h^4}{4!}f_0^{(4)}+\frac{h^5}{5!}f_0^{(5)}$$

**25.3.17**

$$\Delta_0^2\approx h^2f_0^{(2)}+h^3f_0^{(3)}+\frac{7}{12}h^4f_0^{(4)}+\frac{1}{4}h^5f_0^{(5)}$$

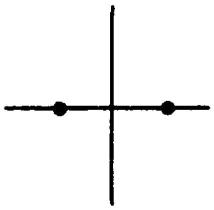
**25.3.18** $$\Delta_0^3\approx h^3f_0^{(3)}+\frac{3}{2}h^4f_0^{(4)}+\frac{5}{4}f_0^{(5)}$$

**25.3.19** $$\Delta_0^4\approx h^4f_0^{(4)}+2h^5f_0^{(5)}$$

**25.3.20** $$\Delta_0^5\approx h^5f_0^{(5)}$$

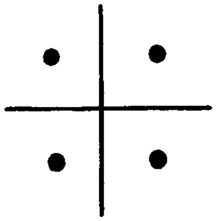
### Partial Derivatives

**25.3.21**



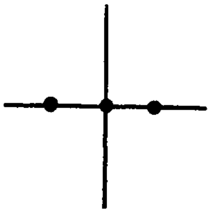
$$\frac{\partial f_{0,0}}{\partial x}=\frac{1}{2h}(f_{1,0}-f_{-1,0})+O(h^2)$$

**25.3.22**



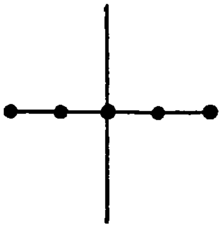
$$\frac{\partial f_{0,0}}{\partial x}=\frac{1}{4h}\left(f_{1,1}-f_{-1,1}+f_{1,-1}-f_{-1,-1}\right)+O(h^2)$$

**25.3.23**



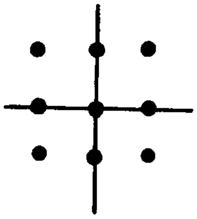
$$\frac{\partial^2 f_{0,0}}{\partial x^2}=\frac{1}{h^2}\left(f_{1,0}-2f_{0,0}+f_{-1,0}\right)+O(h^2)$$

**25.3.24**



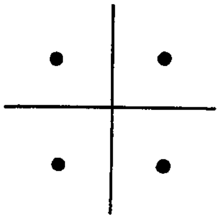
$$\begin{aligned}\frac{\partial^2 f_{0,0}}{\partial x^2}=\frac{1}{12h^2}\big(&-f_{2,0}+16f_{1,0}-30f_{0,0}\\&+16f_{-1,0}-f_{-2,0}\big)+O(h^4)\end{aligned}$$

**25.3.25**



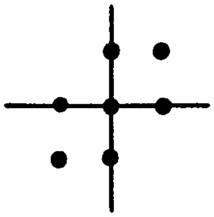
$$\begin{aligned}\frac{\partial^2 f_{0,0}}{\partial x^2}=\frac{1}{3h^2}\big(&f_{1,1}-2f_{0,1}+f_{-1,1}+f_{1,0}-2f_{0,0}+f_{-1,0}\\&+f_{1,-1}-2f_{0,-1}+f_{-1,-1}\big)+O(h^2)\end{aligned}$$

**25.3.26**



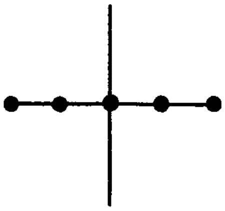
$$\frac{\partial^2 f_{0,0}}{\partial x\partial y}=\frac{1}{4h^2}\left(f_{1,1}-f_{1,-1}-f_{-1,1}+f_{-1,-1}\right)+O(h^2)$$

**25.3.27**



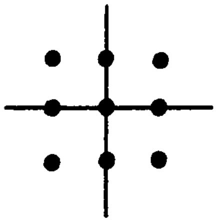
$$\begin{aligned}\frac{\partial^2 f_{0,0}}{\partial x\partial y}=\frac{-1}{2h^2}\big(&f_{1,0}+f_{-1,0}+f_{0,1}+f_{0,-1}\\&-2f_{0,0}-f_{1,1}-f_{-1,-1}\big)+O(h^2)\end{aligned}$$

**25.3.28**



$$\frac{\partial^4 f_{0,0}}{\partial x^4}=\frac{1}{h^4}\left(f_{2,0}-4f_{1,0}+6f_{0,0}-4f_{-1,0}+f_{-2,0}\right)+O(h^2)$$

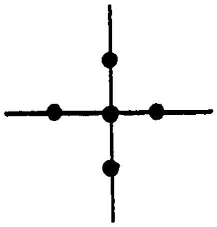
**25.3.29**



$$\begin{aligned}\frac{\partial^4 f_{0,0}}{\partial x^2\partial y^2}=\frac{1}{h^4}\big(&f_{1,1}+f_{-1,1}+f_{1,-1}+f_{-1,-1}\\&-2f_{1,0}-2f_{-1,0}-2f_{0,1}-2f_{0,-1}+4f_{0,0}\big)+O(h^2)\end{aligned}$$

### Laplacian

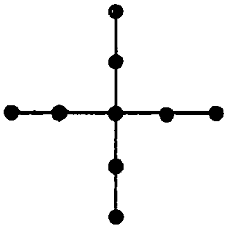
**25.3.30**



$$\nabla^2 u_{0,0}=\left(\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}\right)_{0,0}$$

$$=\frac{1}{h^2}\,(u_{1,0}+u_{0,1}+u_{-1,0}+u_{0,-1}-4u_{0,0})+O(h^2)$$

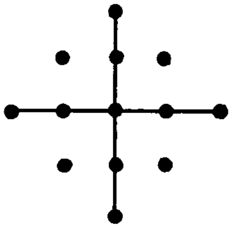
**25.3.31**



$$\nabla^2 u_{0,0}=\frac{1}{12h^2}\,[-60u_{0,0}+16(u_{1,0}+u_{0,1}+u_{-1,0}+u_{0,-1})$$
$$-(u_{2,0}+u_{0,2}+u_{-2,0}+u_{0,-2})]+O(h^4)$$

### Biharmonic Operator

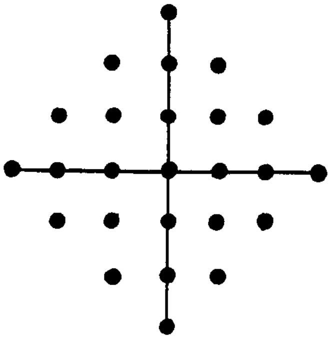
**25.3.32**



$$\nabla^4 u_{0,0}=\left(\frac{\partial^4 u}{\partial x^4}+2\,\frac{\partial^4 u}{\partial x^2\partial y^2}+\frac{\partial^4 u}{\partial y^4}\right)_{0,0}$$

$$=\frac{1}{h^4}[20u_{0,0}-8(u_{1,0}+u_{0,1}+u_{-1,0}+u_{0,-1})$$
$$+2(u_{1,1}+u_{1,-1}+u_{-1,1}+u_{-1,-1})$$
$$+(u_{0,2}+u_{2,0}+u_{-2,0}+u_{0,-2})]+O(h^2)$$

**25.3.33**



$$\nabla^4 u_{0,0}=\frac{1}{6h^4}\,[-(u_{0,3}+u_{0,-3}+u_{3,0}+u_{-3,0})$$
$$+14(u_{0,2}+u_{0,-2}+u_{2,0}+u_{-2,0})$$
$$-77(u_{0,1}+u_{0,-1}+u_{1,0}+u_{-1,0})$$
$$+184u_{0,0}+20(u_{1,1}+u_{1,-1}+u_{-1,1}+u_{-1,-1})$$
$$-(u_{1,2}+u_{2,1}+u_{1,-2}+u_{2,-1}+u_{-1,2}+u_{-2,1}$$
$$+u_{-1,-2}+u_{-2,-1})]+O(h^4)$$

## 25.4. Integration

### Trapezoidal Rule

**25.4.1**

$$\int_{x_0}^{x_1} f(x)dx=\frac{h}{2}\,(f_0+f_1)-\frac{1}{2}\int_{x_0}^{x_1}(t-x_0)(x_1-t)f''(t)\,dt$$
$$=\frac{h}{2}\,(f_0+f_1)-\frac{h^3}{12}f''(\xi)\qquad (x_0<\xi<x_1)$$

### Extended Trapezoidal Rule

**25.4.2**

$$\int_{x_0}^{x_m} f(x)dx=h\left[\frac{f_0}{2}+f_1+\ldots+f_{m-1}+\frac{f_m}{2}\right]$$
$$-\frac{mh^3}{12}f''(\xi)$$

### Error Term in Trapezoidal Formula for Periodic Functions

If $f(x)$ is periodic and has a continuous $k^{\text{th}}$ derivative, and if the integral is taken over a period, then

**25.4.3** $$|\text{Error}|\leq\frac{\text{constant}}{m^k}$$

### Modified Trapezoidal Rule

**25.4.4**

$$\int_{x_0}^{x_m} f(x)dx=h\left[\frac{f_0}{2}+f_1+\ldots+f_{m-1}+\frac{f_m}{2}\right]$$
$$+\frac{h}{24}\,[-f_{-1}+f_1+f_{m-1}-f_{m+1}]+\frac{11m}{720}\,h^5 f^{(4)}(\xi)$$

### Simpson's Rule

**25.4.5**

$$\int_{x_0}^{x_2} f(x)dx=\frac{h}{3}[f_0+4f_1+f_2]$$

$$+\frac{1}{6}\int_{x_0}^{x_1}(x_0-t)^2(x_1-t)f^{(3)}(t)dt$$

$$+\frac{1}{6}\int_{x_1}^{x_2}(x_2-t)^2(x_1-t)f^{(3)}(t)dt$$

$$=\frac{h}{3}[f_0+4f_1+f_2]-\frac{h^5}{90}f^{(4)}(\xi)$$

### Extended Simpson's Rule

**25.4.6**

$$\int_{x_0}^{x_{2n}} f(x)dx=\frac{h}{3}[f_0+4(f_1+f_3+\ldots+f_{2n-1})$$

$$+2(f_2+f_4+\ldots+f_{2n-2})+f_{2n}]-\frac{nh^5}{90}f^{(4)}(\xi)$$

### Euler-Maclaurin Summation Formula

**25.4.7**

$$\int_{x_0}^{x_n} f(x)dx=h\left[\frac{f_0}{2}+f_1+f_2+\ldots+f_{n-1}+\frac{f_n}{2}\right]$$

$$-\frac{B_2}{2!}h^2(f'_n-f'_0)-\ldots-\frac{B_{2k}h^{2k}}{(2k)!}[f_n^{(2k-1)}-f_0^{(2k-1)}]+R_{2k}$$

$$R_{2k}=\frac{\theta nB_{2k+2}h^{2k+3}}{(2k+2)!}\max_{x_0\leq x\leq x_n}|f^{(2k+2)}(x)|,\qquad(-1\leq\theta\leq 1)$$

(For $B_{2k}$, Bernoulli numbers, see chapter 23.)

If $f^{(2k+2)}(x)$ and $f^{(2k+4)}(x)$ do not change sign for $x_0<x<x_n$ then $|R_{2k}|$ is less than the first neglected term. If $f^{(2k+2)}(x)$ does not change sign for $x_0<x<x_n$, $|R_{2k}|$ is less than twice the first neglected term.

### Lagrange Formula

**25.4.8**

$$\int_a^b f(x)dx=\sum_{i=0}^{n}(L_i^{(n)}(b)-L_i^{(n)}(a))f_i+R_n$$

(See **25.2.1.**)

**25.4.9**

$$L_i^{(n)}(x)=\frac{1}{\pi'_n(x_i)}\int_{x_0}^{x}\frac{\pi_n(t)}{t-x_i}dt=\int_{x_0}^{x}l_i(t)dt$$

**25.4.10** $$R_n=\frac{1}{(n+1)!}\int_a^b \pi_n(x)f^{(n+1)}(\xi(x))dx$$

### Equally Spaced Abscissas

**25.4.11**

$$\int_{x_0}^{x_k} f(x)dx=\frac{1}{h^n}\sum_{i=0}^{n} f_i\frac{(-1)^{n-i}}{i!(n-i)!}\int_{x_0}^{x_k}\frac{\pi_n(x)}{x-x_i}dx+R_n$$

**25.4.12** $$\int_{x_m}^{x_{m+1}} f(x)dx=h\sum_{i=-\left[\frac{n-1}{2}\right]}^{\left[\frac{n}{2}\right]}A_i(m)f_i+R_n\qquad *$$

(See **Table 25.3** for $A_i(m)$.)

### Newton-Cotes Formulas (Closed Type)

(For Trapezoidal and Simpson's Rules see **25.4.1–25.4.6.**)

**25.4.13** (Simpson's $\frac{3}{8}$ rule)

$$\int_{x_0}^{x_3} f(x)dx=\frac{3h}{8}(f_0+3f_1+3f_2+f_3)-\frac{3f^{(4)}(\xi)h^5}{80}$$

**25.4.14** (Bode's rule)

$$\int_{x_0}^{x_4} f(x)dx=\frac{2h}{45}(7f_0+32f_1+12f_2$$

$$+32f_3+7f_4)-\frac{8f^{(6)}(\xi)h^7}{945}$$

**25.4.15**

$$\int_{x_0}^{x_5} f(x)dx=\frac{5h}{288}(19f_0+75f_1+50f_2+50f_3$$

$$+75f_4+19f_5)-\frac{275f^{(6)}(\xi)h^7}{12096}$$

**25.4.16**

$$\int_{x_0}^{x_6} f(x)dx=\frac{h}{140}(41f_0+216f_1+27f_2+272f_3$$

$$+27f_4+216f_5+41f_6)-\frac{9f^{(8)}(\xi)h^9}{1400}$$

**25.4.17**

$$\int_{x_0}^{x_7} f(x)dx=\frac{7h}{17280}(751f_0+3577f_1+1323f_2$$

$$+2989f_3+2989f_4+1323f_5+3577f_6$$

$$+751f_7)-\frac{8183f^{(8)}(\xi)h^9}{518400}$$

**25.4.18**

$$\int_{x_0}^{x_8} f(x)dx=\frac{4h}{14175}(989f_0+5888f_1-928f_2$$

$$+10496f_3-4540f_4+10496f_5-928f_6+5888f_7$$

$$+989f_8)-\frac{2368}{467775}f^{(10)}(\xi)h^{11}$$

**25.4.19**

$$\int_{x_0}^{x_9} f(x)dx=\frac{9h}{89600}\{2857(f_0+f_9)$$

$$+15741(f_1+f_8)+1080(f_2+f_7)+19344(f_3+f_6)$$

$$+5778(f_4+f_5)\}-\frac{173}{14620}f^{(10)}(\xi)h^{11}$$

---

*See page II.

**25.4.20**

$$\int_{x_0}^{x_{10}} f(x)dx=\frac{5h}{299376}\{16067(f_0+f_{10})$$
$$+106300(f_1+f_9)-48525(f_2+f_8)+272400(f_3+f_7)$$
$$-260550(f_4+f_6)+427368f_5\}$$
$$-\frac{1346350}{326918592}f^{(12)}(\xi)h^{13}$$

### Newton-Cotes Formulas (Open Type)

**25.4.21**

$$\int_{x_0}^{x_3} f(x)dx=\frac{3h}{2}(f_1+f_2)+\frac{f^{(2)}(\xi)h^3}{4}$$

**25.4.22**

$$\int_{x_0}^{x_4} f(x)dx=\frac{4h}{3}(2f_1-f_2+2f_3)+\frac{28f^{(4)}(\xi)h^5}{90}$$

**25.4.23**

$$\int_{x_0}^{x_5} f(x)dx=\frac{5h}{24}(11f_1+f_2+f_3+11f_4)+\frac{95f^{(4)}(\xi)h^5}{144}$$

**25.4.24**

$$\int_{x_0}^{x_6} f(x)dx=\frac{6h}{20}(11f_1-14f_2+26f_3-14f_4+11f_5)$$
$$+\frac{41f^{(6)}(\xi)h^7}{140}$$

**25.4.25**

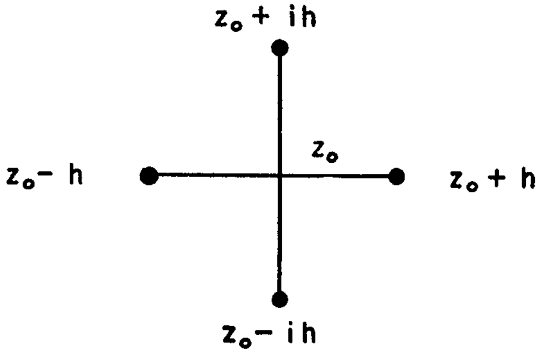
$$\int_{x_0}^{x_7} f(x)dx=\frac{7h}{1440}(611f_1-453f_2+562f_3+562f_4$$
$$-453f_5+611f_6)+\frac{5257}{8640}f^{(6)}(\xi)h^7$$

**25.4.26**

$$\int_{x_0}^{x_8} f(x)dx=\frac{8h}{945}(460f_1-954f_2+2196f_3-2459f_4$$
$$+2196f_5-954f_6+460f_7)+\frac{3956}{14175}f^{(8)}(\xi)h^9$$

### Five Point Rule for Analytic Functions

**25.4.27**



$$\int_{z_0-h}^{z_0+h} f(z)dz=\frac{h}{15}\{24f(z_0)+4[f(z_0+h)+f(z_0-h)]$$
$$-[f(z_0+ih)+f(z_0-ih)]\}+R$$

$|R|\leq\frac{|h|^7}{1890}\underset{z\epsilon S}{\text{Max}}|f^{(6)}(z)|$, $S$ designates the square with vertices $z_0+i^kh(k=0,1,2,3)$; $h$ can be complex.

### Chebyshev's Equal Weight Integration Formula

**25.4.28** $$\int_{-1}^{1} f(x)dx=\frac{2}{n}\sum_{i=1}^{n} f(x_i)+R_n$$

Abscissas: $x_i$ is the $i^{\text{th}}$ zero of the polynomial part of

$$x^n \exp\left[\frac{-n}{2\cdot 3x^2}-\frac{n}{4\cdot 5x^3}-\frac{n}{6\cdot 7x^4}-\ldots\right]$$

(See **Table 25.5** for $x_i$.)

For $n=8$ and $n\geq 10$ some of the zeros are complex.

Remainder:

$$R_n=\int_{-1}^{+1}\frac{x^{n+1}}{(n+1)!}f^{(n+1)}(\xi)dx$$
$$-\frac{2}{n(n+1)!}\sum_{i=1}^{n} x_i^{n+1}f^{(n+1)}(\xi_i)$$

where $\xi=\xi(x)$ satisfies $0\leq\xi\leq x$ and $0\leq\xi_i\leq x_i$

$$(i=1, \ldots, n)$$

## Integration Formulas of Gaussian Type

(For Orthogonal Polynomials see chapter 22)

### Gauss' Formula

**25.4.29** $$\int_{-1}^{1} f(x)dx=\sum_{i=1}^{n} w_if(x_i)+R_n$$

Related orthogonal polynomials: Legendre polynomials $P_n(x)$, $P_n(1)=1$

Abscissas: $x_i$ is the $i^{\text{th}}$ zero of $P_n(x)$

Weights: $w_i=2/(1-x_i^2)[P'_n(x_i)]^2$
(See **Table 25.4** for $x_i$ and $w_i$.)

$$R_n=\frac{2^{2n+1}(n!)^4}{(2n+1)[(2n)!]^3}f^{(2n)}(\xi) \qquad (-1<\xi<1)$$

### Gauss' Formula, Arbitrary Interval

**25.4.30** $$\int_a^b f(y)dy=\frac{b-a}{2}\sum_{i=1}^{n} w_if(y_i)+R_n$$

$$y_i=\left(\frac{b-a}{2}\right)x_i+\left(\frac{b+a}{2}\right)$$

---

*See page II.

Related orthogonal polynomials: $P_n(x)$, $P_n(1)=1$
Abscissas: $x_i$ is the $i^{\text{th}}$ zero of $P_n(x)$
* Weights: $w_i=2/(1-x_i^2)\,[P_n'(x_i)]^2$

* $$R_n=\frac{(b-a)^{2n+1}(n!)^4}{(2n+1)[(2n)!]^3}f^{(2n)}(\xi)$$

### Radau's Integration Formula

**25.4.31**

$$\int_{-1}^{1} f(x)dx=\frac{2}{n^2}f_{-1}+\sum_{i=1}^{n-1} w_i f(x_i)+R_n$$

Related polynomials:

$$\frac{P_{n-1}(x)+P_n(x)}{x+1}$$

Abscissas: $x_i$ is the $i^{\text{th}}$ zero of

$$\frac{P_{n-1}(x)+P_n(x)}{x+1}$$

Weights:

$$w_i=\frac{1}{n^2}\frac{1-x_i}{[P_{n-1}(x_i)]^2}=\frac{1}{1-x_i}\frac{1}{[P_{n-1}'(x_i)]^2}$$

Remainder:

$$R_n=\frac{2^{2n-1}\cdot n}{[(2n-1)!]^3}[(n-1)!]^4 f^{(2n-1)}(\xi) \qquad (-1<\xi<1)$$

### Lobatto's Integration Formula

**25.4.32**

$$\int_{-1}^{1} f(x)dx=\frac{2}{n(n-1)}[f(1)+f(-1)] +\sum_{i=2}^{n-1} w_i f(x_i)+R_n$$

Related polynomials: $P_{n-1}'(x)$

Abscissas: $x_i$ is the $(i-1)^{\text{st}}$ zero of $P_{n-1}'(x)$

Weights:

$$w_i=\frac{2}{n(n-1)[P_{n-1}(x_i)]^2} \qquad (x_i\neq\pm 1)$$

(See **Table 25.6** for $x_i$ and $w_i$.)

Remainder:

$$R_n=\frac{-n(n-1)^3 2^{2n-1}[(n-2)!]^4}{(2n-1)[(2n-2)!]^3}f^{(2n-2)}(\xi) \qquad (-1<\xi<1)$$

**25.4.33** $$\int_0^1 x^k f(x)dx=\sum_{i=1}^{n} w_i f(x_i)+R_n$$

Related orthogonal polynomials:

### Filon's Integration Formula[3]

**25.4.47**

$$\int_{x_0}^{x_{2n}} f(x)\cos tx\,dx=h\Big[\alpha(th)(f_{2n}\sin tx_{2n}-f_0\sin tx_0)+\beta(th)\cdot C_{2n}+\gamma(th)\cdot C_{2n-1}+\frac{2}{45}\,th^4S'_{2n-1}\Big]-R_n$$

**25.4.48**

$$C_{2n}=\sum_{i=0}^{n} f_{2i}\cos(tx_{2i})-\tfrac{1}{2}[f_{2n}\cos tx_{2n}+f_0\cos tx_0]$$

**25.4.49**

$$C_{2n-1}=\sum_{i=1}^{n} f_{2i-1}\cos tx_{2i-1}$$

**25.4.50**

$$S'_{2n-1}=\sum_{i=1}^{n} f^{(3)}_{2i-1}\sin tx_{2i-1}$$

**25.4.51**

$$R_n=\frac{1}{90}nh^5f^{(4)}(\xi)+O(th^7)$$

**25.4.52**

$$\alpha(\theta)=\frac{1}{\theta}+\frac{\sin 2\theta}{2\theta^2}-\frac{2\sin^2\theta}{\theta^3}$$

$$\beta(\theta)=2\left(\frac{1+\cos^2\theta}{\theta^2}-\frac{\sin 2\theta}{\theta^3}\right)$$

$$\gamma(\theta)=4\left(\frac{\sin\theta}{\theta^3}-\frac{\cos\theta}{\theta^2}\right)$$

For small $\theta$ we have

**25.4.53**

$$\alpha=\frac{2\theta^3}{45}-\frac{2\theta^5}{315}+\frac{2\theta^7}{4725}-\dots$$

$$\beta=\frac{2}{3}+\frac{2\theta^2}{15}-\frac{4\theta^4}{105}+\frac{2\theta^6}{567}-\dots$$

$$\gamma=\frac{4}{3}-\frac{2\theta^2}{15}+\frac{\theta^4}{210}-\frac{\theta^6}{11340}+\dots$$

**25.4.54**

$$\int_{x_0}^{x_{2n}} f(x)\sin tx\,dx=h\Big[\alpha(th)(f_0\cos tx_0-f_{2n}\cos tx_{2n})+\beta S_{2n}+\gamma S_{2n-1}+\frac{2}{45}\,th^4C'_{2n-1}\Big]-R_n$$

**25.4.55**

$$S_{2n}=\sum_{i=0}^{n} f_{2i}\sin(tx_{2i})-\frac{1}{2}[f_{2n}\sin(tx_{2n})+f_0\sin(tx_0)]$$

---

*See page II.

[3] For certain difficulties associated with this formula, see the article by J. W. Tukey, p. 400, "On Numerical Approximation," Ed. R. E. Langer, Madison, 1959.

**25.4.56** $$S_{2n-1}=\sum_{i=1}^{n} f_{2i-1}\sin(tx_{2i-1})$$

**25.4.57** $$C'_{2n-1}=\sum_{i=1}^{n} f^{(3)}_{2i-1}\cos(tx_{2i-1})$$

(See **Table 25.11** for $\alpha$, $\beta$, $\gamma$.)

### Iterated Integrals

**25.4.58**

$$\int_0^x dt_n\int_0^{t_n} dt_{n-1}\ldots\int_0^{t_3} dt_2\int_0^{t_2} f(t_1)dt_1 =\frac{1}{(n-1)!}\int_0^x (x-t)^{n-1}f(t)dt$$

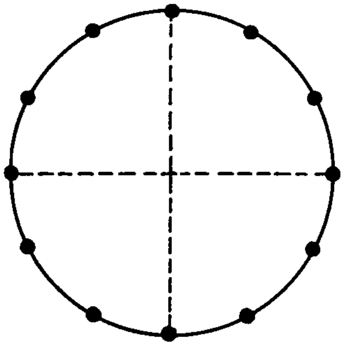
**25.4.59**

$$\int_a^x dt_n\int_a^{t_n} dt_{n-1}\ldots\int_a^{t_3} dt_2\int_a^{t_2} f(t_1)dt_1 =\frac{(x-a)^n}{(n-1)!}\int_0^1 t^{n-1}f(x-(x-a)t)dt$$

### Multidimensional Integration

Circumference of Circle $\Gamma$: $x^2+y^2=h^2$.

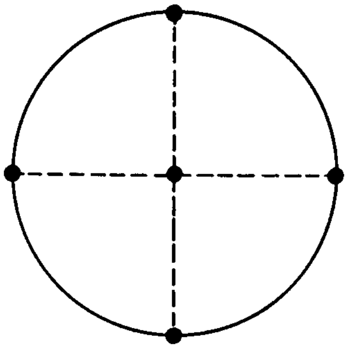
**25.4.60**



$$\frac{1}{2\pi h}\int_\Gamma f(x,y)ds=\frac{1}{2m}\sum_{n=1}^{2m} f\left(h\cos\frac{\pi n}{m}, h\sin\frac{\pi n}{m}\right) +O(h^{2m-2})$$

Circle $C$: $x^2+y^2\leq h^2$.

**25.4.61**



$$\frac{1}{\pi h^2}\iint_C f(x,y)dxdy=\sum_{i=1}^{n} w_i f(x_i,y_i)+R$$

|---|---|
| $(0,0)$ | $16/81$ |

---

[4] For regions, such as the square, cube, cylinder, etc., which are the Cartesian products of lower dimensional regions, one may always develop integration rules by "multiplying together" the lower dimensional rules. Thus if

$$\int_0^1 f(x)\,dx\approx\sum_{i=1}^{n} w_i f(x_i)$$

is a one dimensional rule, then

$$\int_0^1\int_0^1 f(x,y)\,dx\,dy\approx\sum_{i,j=1}^{n} w_i w_j f(x_i,x_j)$$

becomes a two dimensional rule. Such rules are not necessarily the most "economical".

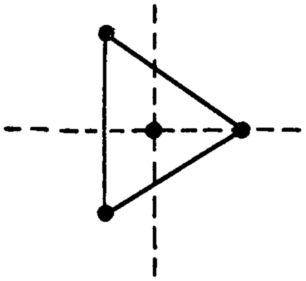
| | | |
|---|---|---|
| $\left(\pm\sqrt{\frac{3}{5}}h,\pm\sqrt{\frac{3}{5}}h\right)$ | 25/324 | $R=O(h^6)$ |
| $\left(0,\pm\sqrt{\frac{3}{5}}h\right)$ | 10/81 | |
| $\left(\pm\sqrt{\frac{3}{5}}h,0\right)$ | 10/81 | |

### Equilateral Triangle T

Radius of Circumscribed Circle$=h$

**25.4.63**

$$\frac{1}{\frac{3}{4}\sqrt{3}h^2}\iint_T f(x,y)dxdy=\sum_{i=1}^{n} w_i f(x_i,y_i)+R$$



| $(x_i,y_i)$ | $w_i$ | |
|---|---|---|
| $(0,0)$ | 3/4 | |
| $(h,0)$ | 1/12 | $R=O(h^3)$ |
| $\left(-\frac{h}{2},\pm\frac{h}{2}\sqrt{3}\right)$ | 1/12 | |

**25.4.68**

$$\frac{1}{8h^3}\iiint_C f(x,y,z)\,dx\,dy\,dz$$

$$=\frac{1}{360}\left[-496f_m+128\sum f_r+8\sum f_f+5\sum f_v\right]+O(h^6)$$

**25.4.69**

$$=\frac{1}{450}\left[91\sum f_f-40\sum f_e+16\sum f_d\right]+O(h^6)$$

where $f_m=f(0,0,0)$.

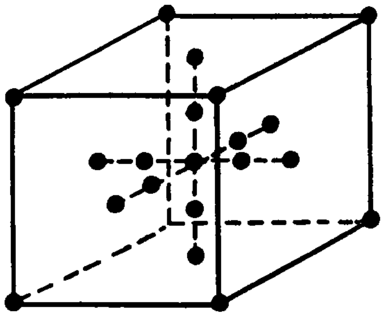
$\sum f_r$=sum of values of $f$ at the 6 points midway from the center of $C$ to the 6 faces.

$\sum f_f$=sum of values of $f$ at the 6 centers of the faces of $C$.

$\sum f_v$=sum of values of $f$ at the 8 vertices of $C$.

$\sum f_e$=sum of values of $f$ at the 12 midpoints of edges of $C$.

$\sum f_d$=sum of values of $f$ at the 4 points on the diagonals of each face at a distance of $\frac{1}{2}\sqrt{5}h$ from the center of the face.



Tetrahedron: $\mathscr{T}$

**25.4.70**

$$\frac{1}{V}\iiint_{\mathscr{T}} f(x,y,z)\,dx\,dy\,dz=\frac{1}{40}\sum f_v+\frac{9}{40}\sum f_f$$

$$+\text{terms of 4}^{\text{th}}\text{ order}$$

$$=\frac{32}{60}f_m+\frac{1}{60}\sum f_v+\frac{4}{60}\sum f_e$$

$$+\text{terms of 4}^{\text{th}}\text{ order}$$

where

$V$: Volume of $\mathscr{T}$

$\sum f_v$: Sum of values of the function at the vertices of $\mathscr{T}$.

$\sum f_e$: Sum of values of the function at midpoints of the edges of $\mathscr{T}$.

$\sum f_f$: Sum of values of the function at the center of gravity of the faces of $\mathscr{T}$.

$f_m$: Value of function at center of gravity of $\mathscr{T}$.

---

[5] See footnote to **25.4.62**.

## 25.5. Ordinary Differential Equations[6]

### First Order: $y'=f(x, y)$

**Point Slope Formula**

**25.5.1** $$y_{n+1}=y_n+hy'_n+O(h^2)$$

**25.5.2** $$y_{n+1}=y_{n-1}+2hy'_n+O(h^3)$$

**Trapezoidal Formula**

**25.5.3** $$y_{n+1}=y_n+\frac{h}{2}(y'_{n+1}+y'_n)+O(h^3)$$

**Adams' Extrapolation Formula**

**25.5.4**

$$y_{n+1}=y_n+\frac{h}{24}(55y'_n-59y'_{n-1}+37y'_{n-2}-9y'_{n-3})+O(h^5)$$

**Adams' Interpolation Formula**

**25.5.5**

$$y_{n+1}=y_n+\frac{h}{24}(9y'_{n+1}+19y'_n-5y'_{n-1}+y'_{n-2})+O(h^5)$$

### Runge-Kutta Methods

**Second Order**

**25.5.6**

$$y_{n+1}=y_n+\frac{1}{2}(k_1+k_2)+O(h^3)$$
$$k_1=hf(x_n,y_n),k_2=hf(x_n+h,y_n+k_1)$$

**25.5.7**

$$y_{n+1}=y_n+k_2+O(h^3)$$
$$k_1=hf(x_n,y_n),k_2=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_1\right)$$

**Third Order**

**25.5.8**

$$y_{n+1}=y_n+\frac{1}{6}k_1+\frac{2}{3}k_2+\frac{1}{6}k_3+O(h^4)$$
$$k_1=hf(x_n,y_n),k_2=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_1\right)$$
$$k_3=hf(x_n+h,y_n-k_1+2k_2)$$

**25.5.9**

$$y_{n+1}=y_n+\frac{1}{4}k_1+\frac{3}{4}k_3+O(h^4)$$
$$k_1=hf(x_n,y_n),k_2=hf\left(x_n+\frac{1}{3}h,y_n+\frac{1}{3}k_1\right)$$
$$k_3=hf\left(x_n+\frac{2}{3}h,y_n+\frac{2}{3}k_2\right)$$

**Fourth Order**

**25.5.10**

$$y_{n+1}=y_n+\frac{1}{6}k_1+\frac{1}{3}k_2+\frac{1}{3}k_3+\frac{1}{6}k_4+O(h^5)$$
$$k_1=hf(x_n,y_n),k_2=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_1\right)$$
$$k_3=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_2\right), k_4=hf(x_n+h,y_n+k_3)$$

**25.5.11**

$$y_{n+1}=y_n+\frac{1}{8}k_1+\frac{3}{8}k_2+\frac{3}{8}k_3+\frac{1}{8}k_4+O(h^5)$$
$$k_1=hf(x_n,y_n),k_2=hf\left(x_n+\frac{1}{3}h,y_n+\frac{1}{3}k_1\right)$$
$$k_3=hf\left(x_n+\frac{2}{3}h,y_n-\frac{1}{3}k_1+k_2\right),$$
$$k_4=hf(x_n+h,y_n+k_1-k_2+k_3)$$

**Gill's Method**

**25.5.12**

$$y_{n+1}=y_n+\frac{1}{6}\left(k_1+2\left(1-\sqrt{\frac{1}{2}}\right)k_2\right.$$
$$\left.+2\left(1+\sqrt{\frac{1}{2}}\right)k_3+k_4\right)+O(h^5)$$
$$k_1=hf(x_n,y_n)$$
$$k_2=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_1\right)$$
$$k_3=hf\left(x_n+\frac{1}{2}h,y_n+\left(-\frac{1}{2}+\sqrt{\frac{1}{2}}\right)k_1\right.$$
$$\left.+\left(1-\sqrt{\frac{1}{2}}\right)k_2\right)$$
$$k_4=hf\left(x_n+h,y_n-\sqrt{\frac{1}{2}}k_2+\left(1+\sqrt{\frac{1}{2}}\right)k_3\right)$$

### Predictor-Corrector Methods

**Milne's Methods**

**25.5.13**

$$\text{P:}\quad y_{n+1}=y_{n-3}+\frac{4h}{3}(2y'_n-y'_{n-1}+2y'_{n-2})+O(h^5)$$

$$\text{C:}\quad y_{n+1}=y_{n-1}+\frac{h}{3}(y'_{n-1}+4y'_n+y'_{n+1})+O(h^5)$$

---

[6] The reader is cautioned against possible instabilities especially in formulas **25.5.2** and **25.5.13**. See, e.g. [25.11], [25.12].

**25.5.14**

$$\text{P:}\quad y_{n+1}=y_{n-5}+\frac{3h}{10}(11y'_n-14y'_{n-1}+26y'_{n-2}-14y'_{n-3}+11y'_{n-4})+O(h^7)$$

$$\text{C:}\quad y_{n+1}=y_{n-3}+\frac{2h}{45}(7y'_{n+1}+32y'_n+12y'_{n-1}+32y'_{n-2}+7y'_{n-3})+O(h^7)$$

### Formulas Using Higher Derivatives

**25.5.15**

$$\text{P:}\quad y_{n+1}=y_{n-2}+3(y_n-y_{n-1})+h^2(y''_n-y''_{n-1})+O(h^5)$$

$$\text{C:}\quad y_{n+1}=y_n+\frac{h}{2}(y'_{n+1}+y'_n)-\frac{h^2}{12}(y''_{n+1}-y''_n)+O(h^5)$$

**25.5.16**

$$\text{P:}\quad y_{n+1}=y_{n-2}+3(y_n-y_{n-1})+\frac{h^3}{2}(y'''_n+y'''_{n-1})+O(h^7)$$

$$\text{C:}\quad y_{n+1}=y_n+\frac{h}{2}(y'_{n+1}+y'_n)-\frac{h^2}{10}(y''_{n+1}-y''_n)+\frac{h^3}{120}(y'''_{n+1}+y'''_n)+O(h^7)$$

## Systems of Differential Equations

### First Order: $y'=f(x,y,z)$, $z'=g(x,y,z)$.

### Second Order Runge-Kutta

**25.5.17**

$$y_{n+1}=y_n+\frac{1}{2}(k_1+k_2)+O(h^3),\qquad z_{n+1}=z_n+\frac{1}{2}(l_1+l_2)+O(h^3)$$

$$k_1=hf(x_n,y_n,z_n),\qquad l_1=hg(x_n,y_n,z_n)$$

$$k_2=hf(x_n+h,y_n+k_1,z_n+l_1),\qquad l_2=hg(x_n+h,y_n+k_1,z_n+l_1)$$

### Fourth Order Runge-Kutta

**25.5.18**

$$y_{n+1}=y_n+\frac{1}{6}(k_1+2k_2+2k_3+k_4)+O(h^5),\qquad z_{n+1}=z_n+\frac{1}{6}(l_1+2l_2+2l_3+l_4)+O(h^5)$$

$$k_1=hf(x_n,y_n,z_n)\qquad l_1=hg(x_n,y_n,z_n)$$

$$k_2=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_1,z_n+\frac{1}{2}l_1\right)\qquad l_2=hg\left(x_n+\frac{h}{2},y_n+\frac{k_1}{2},z_n+\frac{l_1}{2}\right)$$

$$k_3=hf\left(x_n+\frac{1}{2}h,y_n+\frac{1}{2}k_2,z_n+\frac{1}{2}l_2\right)\qquad l_3=hg\left(x_n+\frac{h}{2},y_n+\frac{k_2}{2},z_n+\frac{l_2}{2}\right)$$

$$k_4=hf(x_n+h,y_n+k_3,z_n+l_3)\qquad l_4=hg(x_n+h,y_n+k_3,z_n+l_3)$$

### Second Order: $y''=f(x,y,y')$

### Milne's Method

**25.5.19**

$$\text{P:}\quad y'_{n+1}=y'_{n-3}+\frac{4h}{3}(2y''_{n-2}-y''_{n-1}+2y''_n)+O(h^5)$$

$$\text{C:}\quad y'_{n+1}=y'_{n-1}+\frac{h}{3}(y''_{n-1}+4y''_n+y''_{n+1})+O(h^5)$$

### Runge-Kutta Method

**25.5.20**

$$y_{n+1}=y_n+h\left[y'_n+\frac{1}{6}(k_1+k_2+k_3)\right]+O(h^5)$$

$$y'_{n+1}=y'_n+\frac{1}{6}(k_1+2k_2+2k_3+k_4)$$

$$k_1=hf(x_n,y_n,y'_n)$$

$$k_2=hf\left(x_n+\frac{1}{2}h,y_n+\frac{h}{2}y'_n+\frac{h}{8}k_1,y'_n+\frac{k_1}{2}\right)$$

$$k_3=hf\left(x_n+\frac{1}{2}h,y_n+\frac{h}{2}y'_n+\frac{h}{8}k_1,y'_n+\frac{k_2}{2}\right)\qquad *$$

$$k_4=hf\left(x_n+h,y_n+hy'_n+\frac{h}{2}k_3,y'_n+k_3\right)$$

### Second Order: $y''=f(x,y)$

### Milne's Method

**25.5.21**

$$\text{P:}\quad y_{n+1}=y_n+y_{n-2}-y_{n-3}+\frac{h^2}{4}(5y''_n+2y''_{n-1}+5y''_{n-2})+O(h^6)$$

$$\text{C:}\quad y_n=2y_{n-1}-y_{n-2}+\frac{h^2}{12}(y''_n+10y''_{n-1}+y''_{n-2})+O(h^6)$$

### Runge-Kutta Method

**25.5.22**

$$y_{n+1}=y_n+h\left(y'_n+\frac{1}{6}(k_1+2k_2)\right)+O(h^4)$$

$$y'_{n+1}=y'_n+\frac{1}{6}k_1+\frac{2}{3}k_2+\frac{1}{6}k_3$$

$$k_1=hf(x_n,y_n)$$

$$k_2=hf\left(x_n+\frac{h}{2},y_n+\frac{h}{2}y'_n+\frac{h}{8}k_1\right)$$

$$k_3=hf\left(x_n+h,y_n+hy'_n+\frac{h}{2}k_2\right).$$

## COEFFICIENTS FOR DIFFERENTIATION

Differentiation Formula: $\left.\frac{d^kf(x)}{dx^k}\right|_{x=x_j} \approx \frac{k!}{m!h^k}\sum_{i=0}^{m} A_i f(x_i)$

### FIRST DERIVATIVE ($k=1$)

| * $j$ | $A_0$ | $A_1$ | $A_2$ | $A_3$ | $A_4$ | $A_5$ | $\frac{h^k}{k!}$ Error |
|---|---|---|---|---|---|---|---|
| Three Point ($m=2$) | | | | | | | |
| 0 | −3 | 4 | −1 | | | | 1/3 |
| 1 | −1 | 0 | 1 | | | | $-1/6\ h^3f^{(3)}$ |
| 2 | 1 | −4 | 3 | | | | 1/3 |
| Four Point ($m=3$) | | | | | | | |
| 0 | −11 | 18 | −9 | 2 | | | −1/4 |
| 1 | −2 | −3 | 6 | −1 | | | 1/12 |
| 2 | 1 | −6 | 3 | 2 | | | $-1/12\ h^4f^{(4)}$ |
| 3 | −2 | 9 | −18 | 11 | | | 1/4 |
| Five Point ($m=4$) | | | | | | | |
| 0 | −50 | 96 | −72 | 32 | −6 | | 1/5 |
| 1 | −6 | −20 | 36 | −12 | 2 | | −1/20 |
| 2 | 2 | −16 | 0 | 16 | −2 | | $1/30\ h^5f^{(5)}$ |
| 3 | −2 | 12 | −36 | 20 | 6 | | −1/20 |
| 4 | 6 | −32 | 72 | −96 | 50 | | 1/5 |
| Six Point ($m=5$) | | | | | | | |
| 0 | −274 | 600 | −600 | 400 | −150 | 24 | −1/6 |
| 1 | −24 | −130 | 240 | −120 | 40 | −6 | 1/30 |
| 2 | 6 | −60 | −40 | 120 | −30 | 4 | $-1/60\ h^6f^{(6)}$ |
| 3 | −4 | 30 | −120 | 40 | 60 | −6 | 1/60 |
| 4 | 6 | −40 | 120 | −240 | 130 | 24 | −1/30 |
| 5 | −24 | 150 | −400 | 600 | −600 | 274 | 1/6 |

### SECOND DERIVATIVE ($k=2$)

| * $j$ | $A_0$ | $A_1$ | $A_2$ | $A_3$ | $A_4$ | $A_5$ | $\frac{h^k}{k!}$ Error |
|---|---|---|---|---|---|---|---|
| Three Point ($m=2$) | | | | | | | |
| 0 | 1 | −2 | 1 | | | | $-1/2\ h^3f^{(3)}$ |
| 1 | 1 | −2 | 1 | | | | $-1/24\ h^4f^{(4)}$ |
| 2 | 1 | −2 | 1 | | | | $1/2\ h^3f^{(3)}$ |
| Four Point ($m=3$) | | | | | | | |
| 0 | 6 | −15 | 12 | −3 | | | 11/24 |
| 1 | 3 | −6 | 3 | 0 | | | −1/24 |
| 2 | 0 | 3 | −6 | 3 | | | $-1/24\ h^4f^{(4)}$ |
| 3 | −3 | 12 | −15 | 6 | | | 11/24 |
| Five Point ($m=4$) | | | | | | | |
| 0 | 35 | −104 | 114 | −56 | 11 | | $-5/12\ h^5f^{(5)}$ |
| 1 | 11 | −20 | 6 | 4 | −1 | | 1/24 |

# 26. Probability Functions

## Mathematical Properties[3]

### 26.1. Probability Functions: Definitions and Properties

#### Univariate Cumulative Distribution Functions

A real-valued function $F(x)$ is termed a (univariate) cumulative distribution function (c.d.f.) or simply distribution function if

i) $F(x)$ is non-decreasing, i.e., $F(x_1) \leq F(x_2)$ for $x_1 \leq x_2$

ii) $F(x)$ is everywhere continuous from the right, i.e., $F(x) = \lim_{\epsilon \to 0+} F(x+\epsilon)$

iii) $F(-\infty)=0$, $F(\infty)=1$.

The function $F(x)$ signifies the probability of the event "$X \leq x$" where $X$ is a random variable, i.e., $Pr\{X \leq x\} = F(x)$, and thus describes the c.d.f. of $X$. The two principal types of distribution functions are termed *discrete* and *continuous*.

*Discrete Distributions:* Discrete distributions are characterized by the random variable $X$ taking on an enumerable number of values . . ., $x_{-1}$, $x_0$, $x_1$, . . . with point probabilities

$$p_n = Pr\{X = x_n\} \geq 0$$

which need only be subject to the restriction

$$\sum_n p_n = 1.$$

The corresponding distribution function can then be written

**26.1.1**
$$F(x) = Pr\{X \leq x\} = \sum_{x_n \leq x} p_n$$

where the summation is over all values of $x$ for which $x_n \leq x$. The set $\{x_n\}$ of values for which $p_n > 0$ is termed the domain of the random variable $X$. A discrete distribution of a random variable is called a *lattice distribution* if there exist numbers $a$ and $b \neq 0$ such that every possible value of $X$ can be represented in the form $a+bn$ where $n$ takes on only integral values. A summary of some properties of certain discrete distributions is presented in **26.1.19–26.1.24.**

*Continuous Distributions.* Continuous distributions are characterized by $F(x)$ being absolutely continuous. Hence $F(x)$ possesses a derivative $F'(x) = f(x)$ and the c.d.f. can be written

**26.1.2**
$$F(x) = Pr\{X \leq x\} = \int_{-\infty}^{x} f(t)dt.$$

The derivative $f(x)$ is termed the *probability density function* (p.d.f.) or *frequency function,* and the values of $x$ for which $f(x) > 0$ make up the domain of the random variable $X$. A summary of some properties of certain selected continuous distributions is presented in **26.1.25–26.1.34.**

#### Multivariate Probability Functions

The real-valued function $F(x_1, x_2, \ldots x_n)$ defines an $n$-variate cumulative distribution function if

i) $F(x_1, x_2, \ldots x_n)$ is a non-decreasing function for each $x_i$

ii) $F(x_1, x_2, \ldots x_n)$ is continuous from the right in each $x_i$; i.e., $F(x_1, x_2, \ldots x_n) = \lim_{\epsilon \to 0+} F(x_1, \ldots, x_i+\epsilon, \ldots, x_n)$

iii) $F(x_1, x_2, \ldots x_n) = 0$ when any $x_i = -\infty$; $F(\infty, \infty, \ldots, \infty) = 1$. *

iv) $F(x_1, x_2, \ldots, x_n)$ assigns nonnegative probability to the event $x_1 < X_1 \leq x_1+h_1$, $x_2 < X_2 \leq x_2+h_2$, . . ., $x_n < X_n \leq x_n+h_n$ for all $x_1, x_2, \ldots, x_n$ and all nonnegative $h_1, h_2, \ldots, h_n$, e.g., for $n=2$, $F(x_1+h_1, x_2+h_2) - F(x_1, x_2+h_2) - F(x_1+h_1, x_2) + F(x_1, x_2) \geq 0$ and in general for $x_i < X_i \leq x_i + h_i$ $(i=1, 2, \ldots, n)$, the $k$th order difference $\Delta_k F(x_1, x_2, \ldots, x_n) > 0$ for $k=1, 2, \ldots, n$.

---

[3] *Comment on notation and conventions.*

a. We follow the customary convention of denoting a random variable by a capital letter, i.e., $X$, and using the corresponding lower case letter, i.e., $x$, for a particular value that the random variable assumes.

b. For statistical applications it is often convenient to have tabulated the "upper tail area," $1-F(x)$, or the c.d.f. for $|X|$, $F(x)-F(-x)$, instead of simply the c.d.f. $F(x)$. We use the notation $P$ to indicate the c.d.f. of $X$, $Q=1-P$ to indicate the "upper tail area" and $A=P-Q$ to denote the c.d.f. of $|X|$. In particular we use $P(x)$, $Q(x)$, and $A(x)$ to denote the corresponding functions for the normal or Gaussian probability function, see **26.2.2–26.2.4.** When these distributions depend on other parameters, say $\theta_1$ and $\theta_2$, we indicate this by writing $P(x|\theta_1, \theta_2)$, $Q(x|\theta_1, \theta_2)$, or $A(x|\theta_1, \theta_2)$. For example the chi-square distribution **26.4** depends on the parameter $\nu$ and the tabulated function is written $Q(\chi^2|\nu)$.

---

*See page II.

The joint probability of the event $X_1 \leq x_1$, $X_2 \leq x_2$, . . ., $X_n \leq x_n$ is $F(x_1, x_2, \ldots x_n)$. Analogous to the one-dimensional case, *discrete* distributions assign all probability to an enumerable set of vectors $(x_1, x_2, \ldots, x_n)$ and *continuous* distributions are characterized by absolute continuity of $F(x_1, x_2, \ldots, x_n)$.

*Characteristics of distribution functions: Moments, characteristic functions, cumulants*

| | | Continuous distributions | Discrete distributions |
|---|---|---|---|
| 26.1.3 | $n^{\text{th}}$ moment about origin | $\mu_n'=\int_{-\infty}^{\infty} x^n f(x)dx$ | $\mu_n'=\sum_s x_s^n p_s$ |
| 26.1.4 | mean | $m=\mu_1'=\int_{-\infty}^{\infty} x f(x)dx$ | $m=\mu_1'=\sum_s x_s p_s$ |
| 26.1.5 | variance | $\sigma^2=\mu_2'-m^2=\int_{-\infty}^{\infty} (x-m)^2 f(x)dx$ | $\sigma^2=\mu_2'-m^2=\sum_s (x_s-m)^2 p_s$ |
| 26.1.6 | $n^{\text{th}}$ central moment | $\mu_n=\int_{-\infty}^{\infty} (x-m)^n f(x)dx$ | $\mu_n=\sum_s (x_s-m)^n p_s$ |
| 26.1.7 | expected value operator for the function $g(x)$ | $E[g(X)]=\int_{-\infty}^{\infty} g(x)f(x)dx$ | $E[g(X)]=\sum_s g(x_s)p_s$ |
| 26.1.8 | characteristic function of $X$ | $\phi(t)=E(e^{itX})=\int_{-\infty}^{\infty} e^{itx}f(x)dx$ | $\phi(t)=E(e^{itX})=\sum_s e^{itx_s}p_s$ |
| 26.1.9 | characteristic function of $g(X)$ | $\phi_g(t)=E(e^{itg(X)})=\int_{-\infty}^{\infty} e^{itg(x)}f(x)dx$ | $\phi_g(t)=E(e^{itg(X)})=\sum_s e^{itg(x_s)}p_s$ |
| 26.1.10 | inversion formula | $f(x)=\frac{1}{2\pi}\int_{-\infty}^{\infty} e^{-itx}\phi(t)dt$ | $p_n=\frac{b}{2\pi}\int_{-\pi/b}^{\pi/b} e^{-itx_n}\phi(t)dt$<br>(lattice distributions only) |

### Relation of the Characteristic Function to Moments About the Origin

**26.1.11**
$$\phi^{(n)}(0)=\left[\frac{d^n}{dt^n}\phi(t)\right]_{t=0}=i^n\mu_n'$$

### Cumulant Function

**26.1.12**
$$\ln \phi(t)=\sum_{n=0}^{\infty} \kappa_n \frac{(it)^n}{n!}$$

$\kappa_n$ is called the $n^{\text{th}}$ cumulant.

**26.1.13** $\kappa_1=m,\ \kappa_2=\sigma^2,\ \kappa_3=\mu_3,\ \kappa_4=\mu_4-3\mu_2^2$

### Relation of Central Moments to Moments About the Origin

**26.1.14**
$$\mu_n=\sum_{j=0}^{n}\binom{n}{j}(-1)^{n-j}\mu_j' m^{n-j}$$

### Coefficients of Skewness and Excess

**26.1.15**
$$\gamma_1=\frac{\kappa_3}{\kappa_2^{3/2}}=\frac{\mu_3}{\sigma^3} \qquad \text{(skewness)}$$

**26.1.16**
$$\gamma_2=\frac{\kappa_4}{\kappa_2^2}=\frac{\mu_4}{\sigma^4}-3 \qquad \text{(excess)}$$

Occasionally coefficients of skewness and excess (or kurtosis) are given by

**26.1.17**
$$\beta_1=\gamma_1^2=\left(\frac{\mu_3}{\sigma^3}\right)^2 \qquad \text{(skewness)}$$

**26.1.18**
$$\beta_2=\gamma_2+3=\frac{\mu_4}{\sigma^4}$$

(excess or kurtosis)

*Some one-dimensional discrete distribution functions*

| Name | Domain | Point Probabilities | Restrictions on Parameters | Mean | Variance | Skewness $\gamma_1$ | Excess $\gamma_2$ | Characteristic function | Cumulants |
|---|---|---|---|---|---|---|---|---|---|
| **26.1.19**<br>Single point or degenerate | $x=c$ ($c$ a constant) | $p=1$ | $-\infty<c<+\infty$ | $c$ | 0 | ---------- | ---------- | $e^{i\lambda t}$ | $\kappa_1=\lambda$, $\kappa_r=0$ for $r>1$ |
| **26.1.20**<br>Binomial | $x_s=s$, for $s=0, 1, 2, \ldots, n$ | $\binom{n}{s} p^s(1-p)^{n-s}$ | $0<p<1$ $(q=1-p)$ | $np$ | $npq$ | $\frac{q-p}{\sqrt{npq}}$ | $\frac{1-6pq}{npq}$ | $(q+pe^{it})^n$ | $\kappa_1=np$<br>$\kappa_{r+1}=pq\frac{d\kappa_r}{dp}$ for $r\geq1$ |

---

[6] $x_0$ is such that $F'(x_0)>F'(x)$ for $x\neq x_0$.

## 26.2. Normal or Gaussian Probability Function

**26.2.1**
$$Z(x)=\frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$

**26.2.2**
$$P(x)=\frac{1}{\sqrt{2\pi}}\int_{-\infty}^{x}e^{-t^2/2}dt=\int_{-\infty}^{x}Z(t)dt$$

**26.2.3**
$$Q(x)=\frac{1}{\sqrt{2\pi}}\int_{x}^{\infty}e^{-t^2/2}dt=\int_{x}^{\infty}Z(t)dt$$

**26.2.4**
$$A(x)=\frac{1}{\sqrt{2\pi}}\int_{-x}^{x}e^{-t^2/2}dt=\int_{-x}^{x}Z(t)dt$$

**26.2.5**
$$P(x)+Q(x)=1$$

**26.2.6**
$$P(-x)=Q(x)$$

**26.2.7**
$$A(x)=2P(x)-1$$

### Probability Integral with Mean $m$ and Variance $\sigma^2$

A random variable $X$ is said to be normally distributed with mean $m$ and variance $\sigma^2$ if the probability that $X$ is less than or equal to $x$ is given by

**26.2.8**
$$Pr\{X\leq x\}=\frac{1}{\sigma\sqrt{2\pi}}\int_{-\infty}^{x}e^{-\frac{(t-m)^2}{2\sigma^2}}dt$$
$$=\frac{1}{\sqrt{2\pi}}\int_{-\infty}^{(x-m)/\sigma}e^{-t^2/2}dt=P\left(\frac{x-m}{\sigma}\right).$$

The corresponding probability density function is

**26.2.9**
$$\frac{\partial}{\partial x}P\left(\frac{x-m}{\sigma}\right)=\frac{1}{\sigma}Z\left(\frac{x-m}{\sigma}\right)=\frac{1}{\sigma\sqrt{2\pi}}e^{-\frac{(x-m)^2}{2\sigma^2}}$$

and is symmetric around $m$, i.e.

$$Z\left(\frac{m+x}{\sigma}\right)=Z\left(\frac{m-x}{\sigma}\right).$$

The inflexion points of the probability density function are at $m\pm\sigma$.

### Power Series ($x \geq 0$)

**26.2.10**
$$P(x)=\frac{1}{2}+\frac{1}{\sqrt{2\pi}}\sum_{n=0}^{\infty}\frac{(-1)^n x^{2n+1}}{n!2^n(2n+1)}$$

**26.2.11**
$$P(x)=\frac{1}{2}+Z(x)\sum_{n=0}^{\infty}\frac{x^{2n+1}}{1\cdot 3\cdot 5\ldots(2n+1)}$$

### Asymptotic Expansions ($x>0$)

**26.2.12**
$$Q(x)=\frac{Z(x)}{x}\left\{1-\frac{1}{x^2}+\frac{1\cdot 3}{x^4}+\ldots+\frac{(-1)^n 1\cdot 3\ldots(2n-1)}{x^{2n}}\right\}+R_n$$

where
$$R_n=(-1)^{n+1}1\cdot 3\ldots(2n+1)\int_x^{\infty}\frac{Z(t)}{t^{2n+2}}\,dt$$

which is less in absolute value than the first neglected term.

**26.2.13**
$$Q(x)\sim\frac{Z(x)}{x}\left\{1-\frac{a_1}{x^2+2}+\frac{a_2}{(x^2+2)(x^2+4)}-\frac{a_3}{(x^2+2)(x^2+4)(x^2+6)}+\ldots\right\}$$

where $a_1=1$, $a_2=1$, $a_3=5$, $a_4=9$, $a_5=129$ and the general term is

$$a_n=c_0 1\cdot 3\ldots(2n-1)+2c_1 1\cdot 3\ldots(2n-3)+2^2c_2 1\cdot 3\ldots(2n-5)+\ldots+2^{n-1}c_{n-1}$$

and $c_s$ is the coefficient of $t^{n-s}$ in the expansion of $t(t-1)\ldots(t-n+1)$.

### Continued Fraction Expansions

**26.2.14**
$$Q(x)=Z(x)\left\{\frac{1}{x+}\,\frac{1}{x+}\,\frac{2}{x+}\,\frac{3}{x+}\,\frac{4}{x+}\cdots\right\}\qquad(x>0)$$

**26.2.15**
$$Q(x)=\frac{1}{2}-Z(x)\left\{\frac{x}{1-}\,\frac{x^2}{3+}\,\frac{2x^2}{5-}\,\frac{3x^2}{7+}\,\frac{4x^2}{9-}\cdots\right\}\qquad(x\geq 0)$$

### Polynomial and Rational Approximations[7] for $P(x)$ and $Z(x)$

$$0\leq x<\infty$$

**26.2.16**
$$P(x)=1-Z(x)(a_1t+a_2t^2+a_3t^3)+\epsilon(x),\qquad t=\frac{1}{1+px}$$
$$|\epsilon(x)|<1\times 10^{-5}$$

$p=.33267$ $\quad a_1=.43618\ 36$

$a_2=-.12016\ 76$

$a_3=.93729\ 80$

**26.2.17**
$$P(x)=1-Z(x)(b_1t+b_2t^2+b_3t^3+b_4t^4+b_5t^5)+\epsilon(x),\qquad t=\frac{1}{1+px}$$
$$|\epsilon(x)|<7.5\times 10^{-8}$$

$p=.23164\ 19$

$b_2=-.35656\ 3782$ $\quad b_5=\ 1.33027\ 4429$

$b_3=\ 1.78147\ 7937$

**26.2.18**
$$P(x)=1-\frac{1}{2}(1+c_1x+c_2x^2+c_3x^3+c_4x^4)^{-4}+\epsilon(x)$$
$$|\epsilon(x)|<2.5\times 10^{-4}$$

$c_1=.196854$ $\quad c_3=.000344$

$c_2=.115194$ $\quad c_4=.019527$

**26.2.19**
$$P(x)=1-\frac{1}{2}(1+d_1x+d_2x^2+d_3x^3+d_4x^4+d_5x^5+d_6x^6)^{-16}+\epsilon(x)$$
$$|\epsilon(x)|<1.5\times 10^{-7}$$

$d_1=.04986\ 73470$ $\quad d_4=.00003\ 80036$

$d_2=.02114\ 10061$ $\quad d_5=.00004\ 88906$

$d_3=.00327\ 76263$ $\quad d_6=.00000\ 53830$

**26.2.20** $Z(x)=(a_0+a_2x^2+a_4x^4+a_6x^6)^{-1}+\epsilon(x)$
$$|\epsilon(x)|<2.7\times 10^{-3}$$

$a_0=2.490895$ $\quad a_4=-.024393$

$a_2=1.466003$ $\quad a_6=\ .178257$

---

[7] Based on approximations in C. Hastings, Jr., Approximations for digital computers. Princeton Univ. Press, Princeton, N.J., 1955 (with permission).

**26.2.21**

$$Z(x)=(b_0+b_2x^2+b_4x^4+b_6x^6+b_8x^8+b_{10}x^{10})^{-1}+\epsilon(x)$$

$$|\epsilon(x)|<2.3\times 10^{-4}$$

$$\begin{array}{ll} b_0=2.50523\ 67 & b_6=\ \ .13064\ 69 \\ b_2=1.28312\ 04 & b_8=-.02024\ 90 \\ b_4=\ \ .22647\ 18 & b_{10}=\ \ .00391\ 32 \end{array}$$

### Rational Approximations [7] for $x_p$ where $Q(x_p)=p$

$$0<p\leq .5$$

**26.2.22**

$$x_p=t-\frac{a_0+a_1t}{1+b_1t+b_2t^2}+\epsilon(p),\qquad t=\sqrt{\ln\frac{1}{p^2}}$$

$$|\epsilon(p)|<3\times 10^{-3}$$

$$\begin{array}{ll} a_0=2.30753 & b_1=.99229 \\ a_1=\ \ .27061 & b_2=.04481 \end{array}$$

**26.2.23**

$$x_p=t-\frac{c_0+c_1t+c_2t^2}{1+d_1t+d_2t^2+d_3t^3}+\epsilon(p),\qquad t=\sqrt{\ln\frac{1}{p^2}}$$

$$|\epsilon(p)|<4.5\times 10^{-4}$$

$$\begin{array}{ll} c_0=2.515517 & d_1=1.432788 \\ c_1=\ \ .802853 & d_2=\ \ .189269 \\ c_2=\ \ .010328 & d_3=\ \ .001308 \end{array}$$

### Bounds Useful as Approximations to the Normal Distribution Function

**26.2.24**

$$P(x)\leq\begin{cases} P_1(x)=\frac{1}{2}+\frac{1}{2}(1-e^{-2x^2/\pi})^{\frac{1}{2}} & (x>0) \\ P_2(x)=1-\frac{(4+x^2)^{\frac{1}{2}}-x}{2}(2\pi)^{-\frac{1}{2}}e^{-x^2/2} & (x>1.4) \end{cases}$$

**26.2.25**

$$P(x)\geq\begin{cases} P_3(x)=\frac{1}{2}+\frac{1}{2}\left(1-e^{-2x^2/\pi}-\frac{2(\pi-3)}{3\pi^2}x^4e^{-x^2/2}\right)^{\frac{1}{2}} & (x>0) \\ P_4(x)=1-\frac{1}{x}(2\pi)^{-\frac{1}{2}}e^{-x^2/2} & (x>2.2) \end{cases}$$

See **Figure 26.1** for error curves.

**26.2.46** $$I_n(0)=I_{-n}(0)=\frac{1}{\left(\frac{n}{2}\right)!2^{\frac{n+2}{2}}} \qquad (n \text{ even})$$

### Asymptotic Expansions of an Arbitrary Probability Density Function and Distribution Function

Let $Y_i$ $(i=1, 2, \ldots, n)$ be $n$ independent random variables with mean $m_i$, variance $\sigma_i^2$, and higher cumulants $\kappa_{r,i}$. Then asymptotic expansions with respect to $n$ for the probability density and cumulative distribution function of

$$X=\frac{\sum\limits_{i=1}^{m}(Y_i-m_i)}{\left(\sum\limits_{i=1}^{m}\sigma_i^2\right)^{\frac{1}{2}}} \text{ are}$$

**26.2.47**

$$f(x)\sim Z(x)-\left[\frac{\gamma_1}{6}\,Z^{(3)}(x)\right]+\left[\frac{\gamma_2}{24}\,Z^{(4)}(x)+\frac{\gamma_1^2}{72}\,Z^{(6)}(x)\right]$$
$$-\left[\frac{\gamma_3}{120}\,Z^{(5)}(x)+\frac{\gamma_1\gamma_2}{144}\,Z^{(7)}(x)+\frac{\gamma_1^3}{1296}\,Z^{(9)}(x)\right]$$
$$+\left[\frac{\gamma_4}{720}\,Z^{(6)}(x)+\frac{\gamma_2^2}{1152}\,Z^{(8)}(x)+\frac{\gamma_1\gamma_3}{720}\,Z^{(8)}(x)\right.$$
$$\left.+\frac{\gamma_1^2\gamma_2}{1728}\,Z^{(10)}(x)+\frac{\gamma_1^4}{31104}\,Z^{(12)}(x)\right]+\ldots$$

**26.2.48**

$$F(x)\sim P(x)-\left[\frac{\gamma_1}{6}\,Z^{(2)}(x)\right]+\left[\frac{\gamma_2}{24}\,Z^{(3)}(x)+\frac{\gamma_1^2}{72}\,Z^{(5)}(x)\right]$$
$$-\left[\frac{\gamma_3}{120}\,Z^{(4)}(x)+\frac{\gamma_1\gamma_2}{144}\,Z^{(6)}(x)+\frac{\gamma_1^3}{1296}\,Z^{(8)}(x)\right]$$
$$+\left[\frac{\gamma_4}{720}\,Z^{(5)}(x)+\frac{\gamma_2^2}{1152}\,Z^{(7)}(x)+\frac{\gamma_1\gamma_3}{720}\,Z^{(7)}(x)\right.$$
$$\left.+\frac{\gamma_1^2\gamma_2}{1728}\,Z^{(9)}(x)+\frac{\gamma_1^4}{31104}\,Z^{(11)}(x)\right]+\ldots$$

where

$$\gamma_{r-2}=\frac{1}{n^{\frac{r}{2}-1}}\,\frac{\left(\frac{1}{n}\sum\limits_{i=1}^{n}\kappa_{r,i}\right)}{\left(\frac{1}{n}\sum\limits_{i=1}^{n}\sigma_i^2\right)^{r/2}}$$

Terms in brackets are terms of the same order with respect to $n$. When the $Y_i$ have the same distribution, then $m_i=m$, $\sigma_i^2=\sigma^2$, $\kappa_{r,i}=\kappa_r$ and

$$\gamma_{r-2}=\frac{1}{n^{\frac{1}{2}r-1}}\left(\frac{\kappa_r}{\sigma^r}\right)$$

### Asymptotic Expansion for the Inverse Function of an Arbitrary Distribution Function

Let the cumulative distribution function of $Y=\sum\limits_{i=1}^{n}Y_i$ be denoted by $F(y)$. Then the (Cornish-Fisher) asymptotic expansion with respect to $n$ for the value of $y_p$ such that $F(y_p)=1-p$ is

**26.2.49** $$y_p\sim m+\sigma w$$

where

$$w=x+[\gamma_1h_1(x)]$$
$$+[\gamma_2h_2(x)+\gamma_1^2h_{11}(x)]$$
$$+[\gamma_3h_3(x)+\gamma_1\gamma_2h_{12}(x)+\gamma_1^3h_{111}(x)]$$
$$+[\gamma_4h_4(x)+\gamma_2^2h_{22}(x)+\gamma_1\gamma_3h_{13}(x)+\gamma_1^2\gamma_2h_{112}(x)$$
$$+\gamma_1^4h_{1111}(x)]+\ldots$$

and

$$Q(x)=p, \qquad \gamma_{r-2}=\frac{\kappa_r}{\kappa_2^{r/2}}, \qquad r=3, 4, \ldots$$

**26.2.50**

$$h_1(x)=\frac{1}{6}\,He_2(x)$$

$$h_2(x)=\frac{1}{24}\,He_3(x)$$

$$h_{11}(x)=-\frac{1}{36}\,[2He_3(x)+He_1(x)]$$

$$h_3(x)=\frac{1}{120}\,[He_4(x)]$$

$$h_{12}(x)=-\frac{1}{24}\,[He_4(x)+He_2(x)]$$

$$h_{111}(x)=\frac{1}{324}\,[12He_4(x)+19He_2(x)]$$

$$h_4(x)=\frac{1}{720}\,He_5(x)$$

$$h_{22}(x)=-\frac{1}{384}\,[3He_5(x)+6He_3(x)+2He_1(x)]$$

$$h_{13}(x)=-\frac{1}{180}\,[2He_5(x)+3He_3(x)]$$

$$h_{112}(x)=\frac{1}{288}\,[14He_5(x)+37He_3(x)+8He_1(x)]$$

$$h_{1111}(x)=-\frac{1}{7776}\,[252He_5(x)+832He_3(x)$$
$$+227He_1(x)]$$

Terms in brackets in **26.2.49** are terms of the same order with respect to $n$. The $He_n(x)$ are the Hermite polynomials. (See chapter **22**.)

**26.2.51**
$$He_n(x)=(-1)^n\frac{Z^{(n)}(x)}{Z(x)}=n!\sum_{m=0}^{\left[\frac{n}{2}\right]}\frac{(-1)^m}{2^m m!(n-2m)!}x^{n-2m}$$

In the following auxiliary table, the polynomial functions $h_1(x)$, $h_2(x)$ . . . $h_{1111}(x)$ are tabulated for

$p=.25$, .1, .05, .025, .01, .005, .0025, .001, .0005.

## 26.3. Bivariate Normal Probability Function

**26.3.1**
$$g(x,y,\rho)=[2\pi\sqrt{1-\rho^2}]^{-1}\exp-\frac{1}{2}\left(\frac{x^2-2\rho xy+y^2}{1-\rho^2}\right)$$

**26.3.2** $$g(x,y,\rho)=(1-\rho^2)^{-\frac{1}{2}}Z(x)Z\left(\frac{y-\rho x}{\sqrt{1-\rho^2}}\right)$$

**26.3.3**
$$L(h,k,\rho)=\int_h^\infty dx\int_k^\infty g(x,y,\rho)dy$$
$$=\int_h^\infty Z(x)dx\int_w^\infty Z(w)\,dw,\qquad w=\left(\frac{k-\rho x}{\sqrt{1-\rho^2}}\right)$$

**26.3.4** $$L(-h,-k,\rho)=\int_{-\infty}^h dx\int_{-\infty}^k g(x,y,\rho)dy$$

**26.3.5** $$L(-h,k,-\rho)=\int_{-\infty}^h dx\int_k^\infty g(x,y,\rho)dy$$

**26.3.6** $$L(h,-k,-\rho)=\int_h^\infty dx\int_{-\infty}^k g(x,y,\rho)dy$$

**26.3.7** $$L(h,k,\rho)=L(k,h,\rho)$$

**26.3.8** $$L(-h,k,\rho)+L(h,k,-\rho)=Q(k)$$

**26.3.9** $$L(-h,-k,\rho)-L(h,k,\rho)=P(k)-Q(h)$$

**26.3.10**

* $$2[L(h,k,\rho)+L(h,k,-\rho)+P(h)-Q(k)]-1=\int_{-h}^h dx\int_{-k}^k g(x,y,\rho)dy$$

### Probability Function With Means $m_x$, $m_y$, Variances $\sigma_x^2$, $\sigma_y^2$, and Correlation $\rho$

The random variables $X$, $Y$ are said to be distributed as a bivariate Normal distribution with means and variances $(m_x, m_y)$ and $(\sigma_x^2, \sigma_y^2)$ and correlation $\rho$ if the joint probability that $X$ is less than or equal to $h$ and $Y$ less than or equal to $k$ is given by

**26.3.11**
$$Pr\{X\leq h, Y\leq k\}=\frac{1}{\sigma_x\sigma_y}\int_{-\infty}^{\frac{h-m_x}{\sigma_x}}\int_{-\infty}^{\frac{k-m_y}{\sigma_y}}g(s,t,\rho)ds\,dt$$
$$=L\left(-\left(\frac{h-m_x}{\sigma_x}\right),-\left(\frac{k-m_y}{\sigma_y}\right),\rho\right)$$

The probability density function is

**26.3.12**
$$\frac{1}{2\pi\sigma_x\sigma_y\sqrt{1-\rho^2}}\exp\frac{-Q}{2(1-\rho^2)}=\frac{1}{\sigma_x\sigma_y}g\left(\frac{x-m_x}{\sigma_x},\frac{y-m_y}{\sigma_y},\rho\right)$$

where

$$Q=\frac{(x-m_x)^2}{\sigma_x^2}-\frac{2\rho(x-m_x)(y-m_y)}{\sigma_x\sigma_y}+\frac{(y-m_y)^2}{\sigma_y^2}$$

### Circular Normal Probability Density Function

**26.3.13**
$$\frac{1}{\sigma^2}g\left(\frac{x-m_x}{\sigma},\frac{y-m_y}{\sigma},0\right)=$$
$$\frac{1}{2\pi\sigma^2}\exp-\frac{(x-m_x)^2+(y-m_y)^2}{2\sigma^2}$$

---

*See page II.

### Special Values of $L(h, k, \rho)$

**26.3.14** $$L(h,k,0)=Q(h)Q(k)$$

**26.3.15** $$L(h,k,-1)=0 \qquad (h+k\geq 0)$$

**26.3.16** $$L(h,k,-1)=P(h)-Q(k) \qquad (h+k\leq 0)$$

**26.3.17** $$L(h,k,1)=Q(h) \qquad (k\leq h)$$

**26.3.18** $$L(h,k,1)=Q(k) \qquad (k\geq h)$$

**26.3.19** $$L(0,0,\rho)=\frac{1}{4}+\frac{\arcsin \rho}{2\pi}$$

### $L(h, k, \rho)$ as a Function of $L(h, 0, \rho)$

**26.3.20**

$$L(h,k,\rho)=L\left(h,0,\frac{(\rho h-k)(\operatorname{sgn} h)}{\sqrt{h^2-2\rho hk+k^2}}\right)+L\left(k,0,\frac{(\rho k-h)(\operatorname{sgn} k)}{\sqrt{h^2-2\rho hk+k^2}}\right)-\begin{cases}0 & \text{if } hk>0 \text{ or } hk=0 \\ & \text{and } h+k\geq 0 \\ \frac{1}{2} & \text{otherwise}\end{cases}$$

where $\operatorname{sgn} h=1$ if $h\geq 0$ and $\operatorname{sgn} h=-1$ if $h<0$.

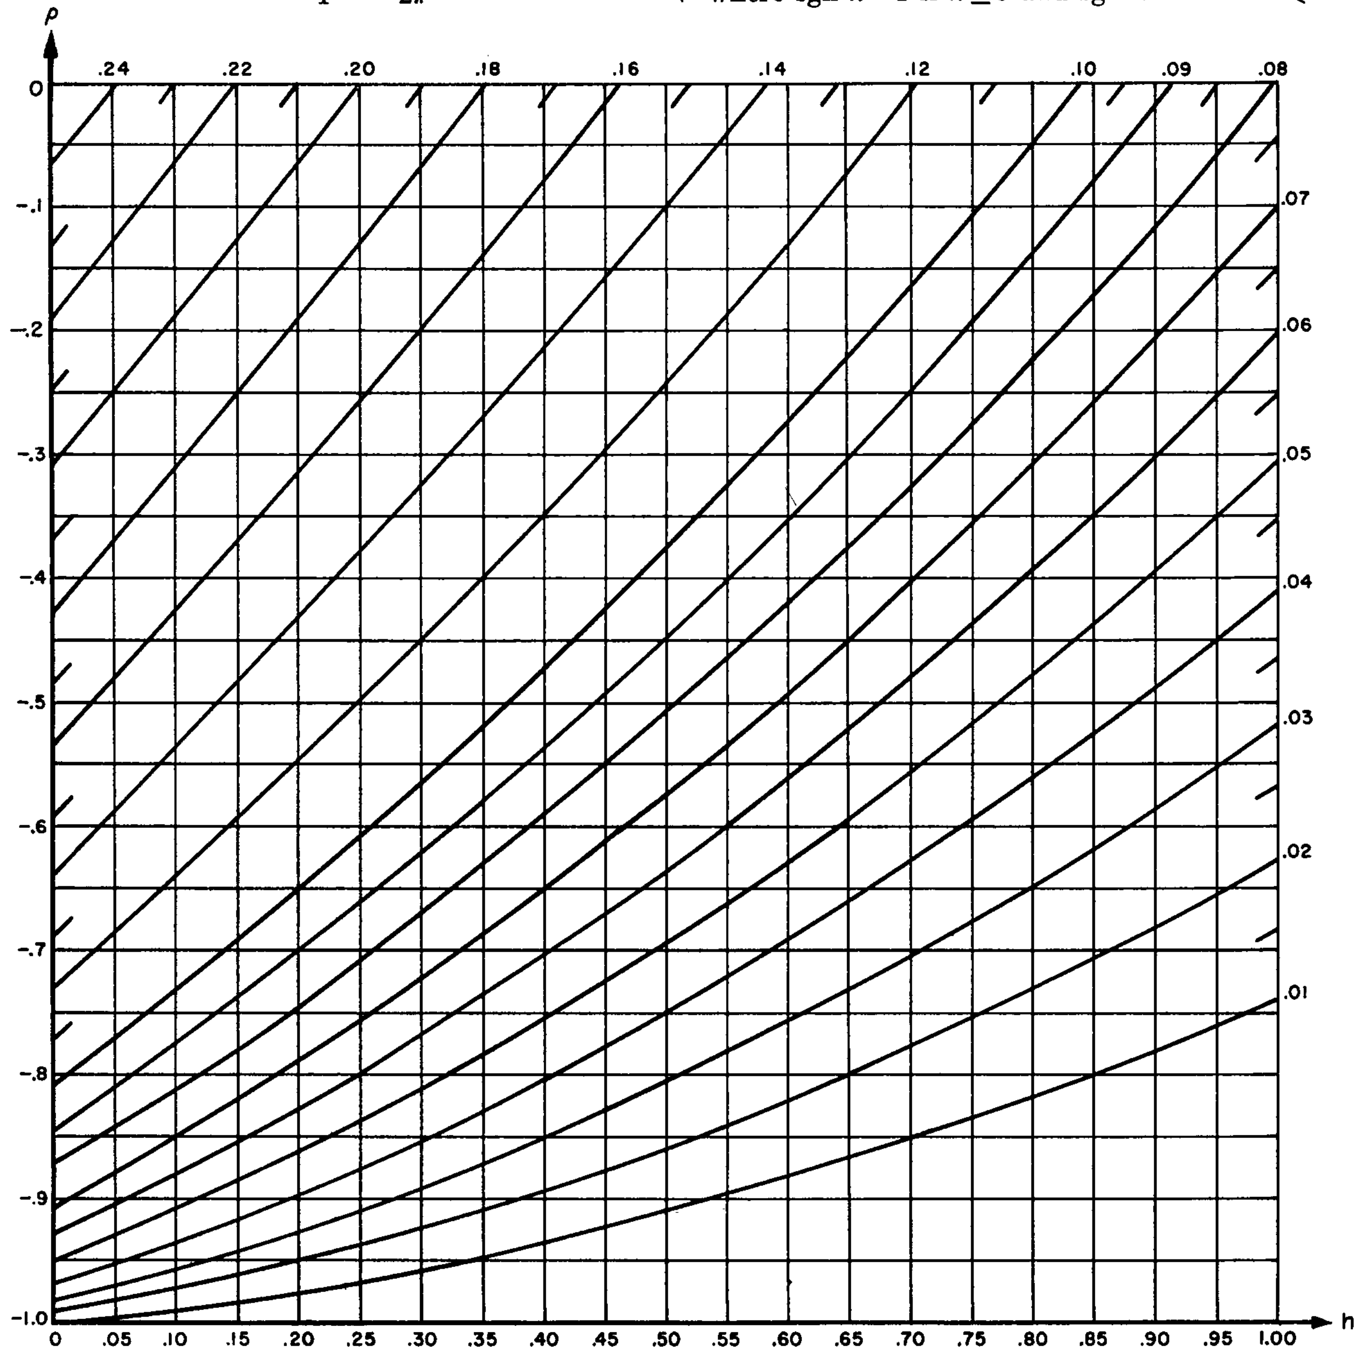

FIGURE 26.2. $L(h,\ 0,\ \rho)$ *for* $0\leq h\leq 1$ *and* $-1\leq \rho\leq 0$.

Values for $h<0$ can be obtained using $L(h,0,-\rho)=\frac{1}{2}-L(-h,0,\rho)$.

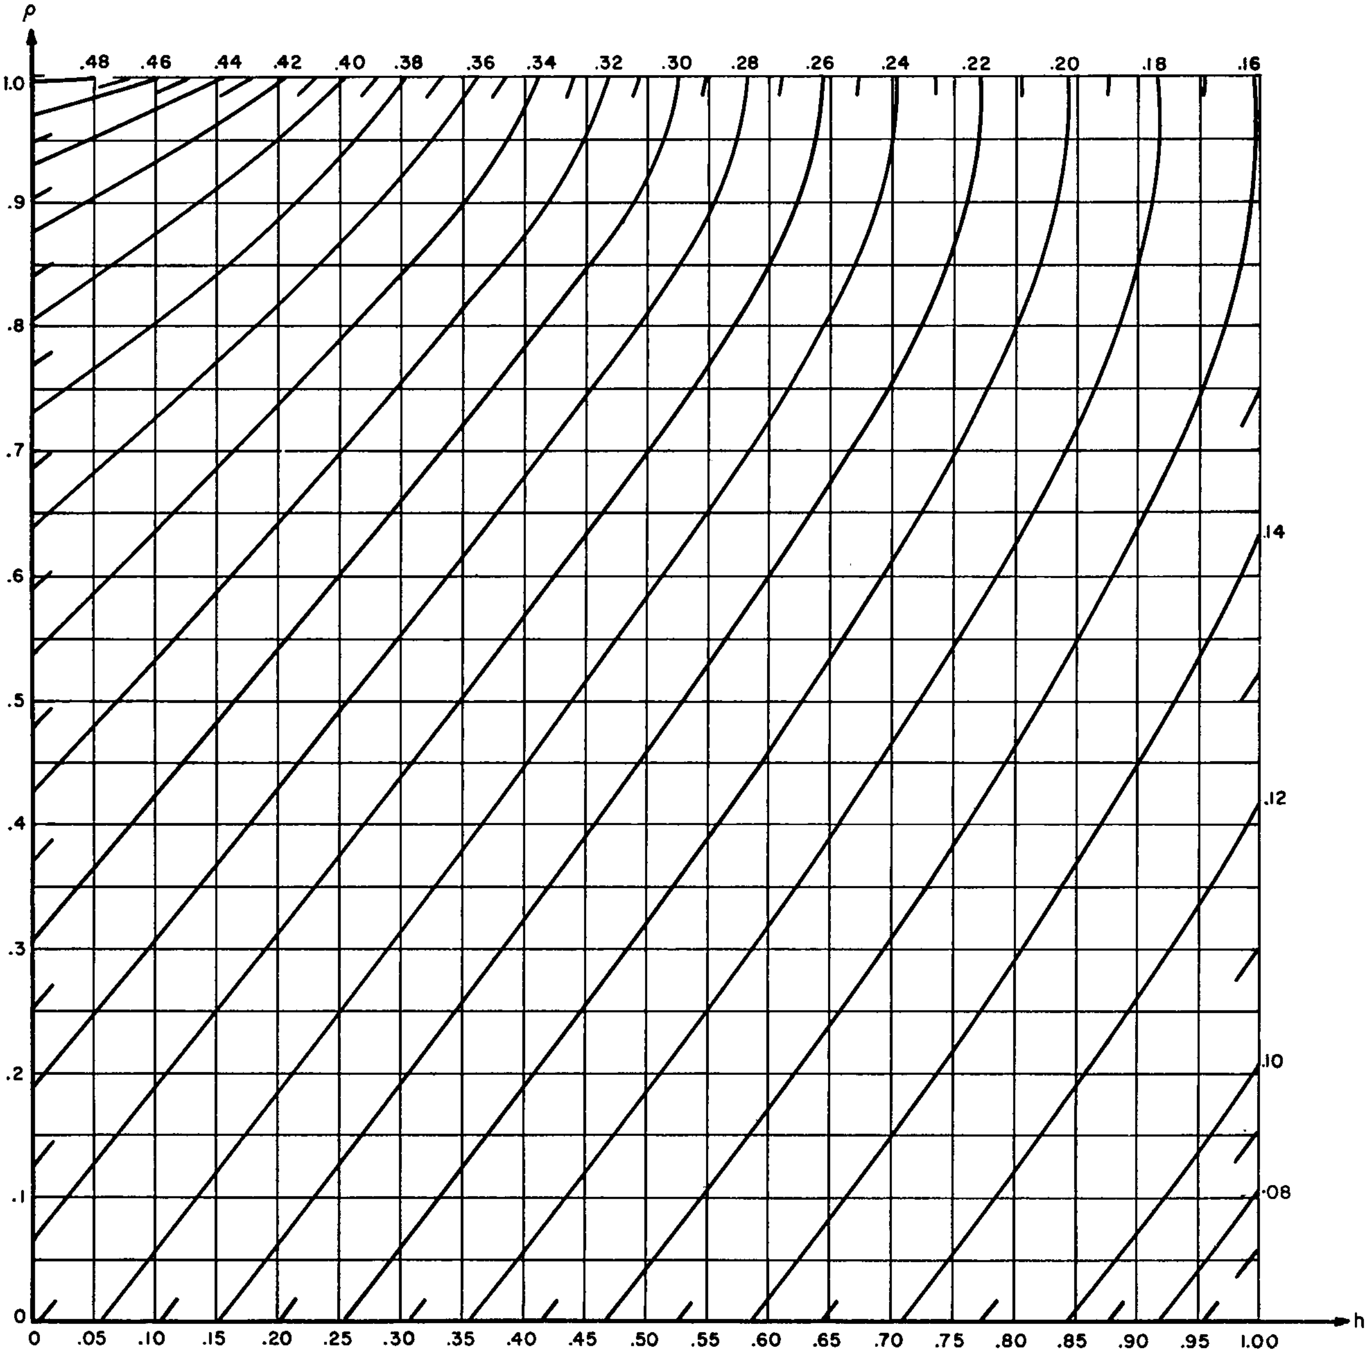

FIGURE 26.3. $L(h, 0, \rho)$ *for* $0 \leq h \leq 1$ *and* $0 \leq \rho \leq 1$.

Values for $h<0$ can be obtained using $L(h, 0, -\rho)=\frac{1}{2}-L(-h, 0, \rho)$.

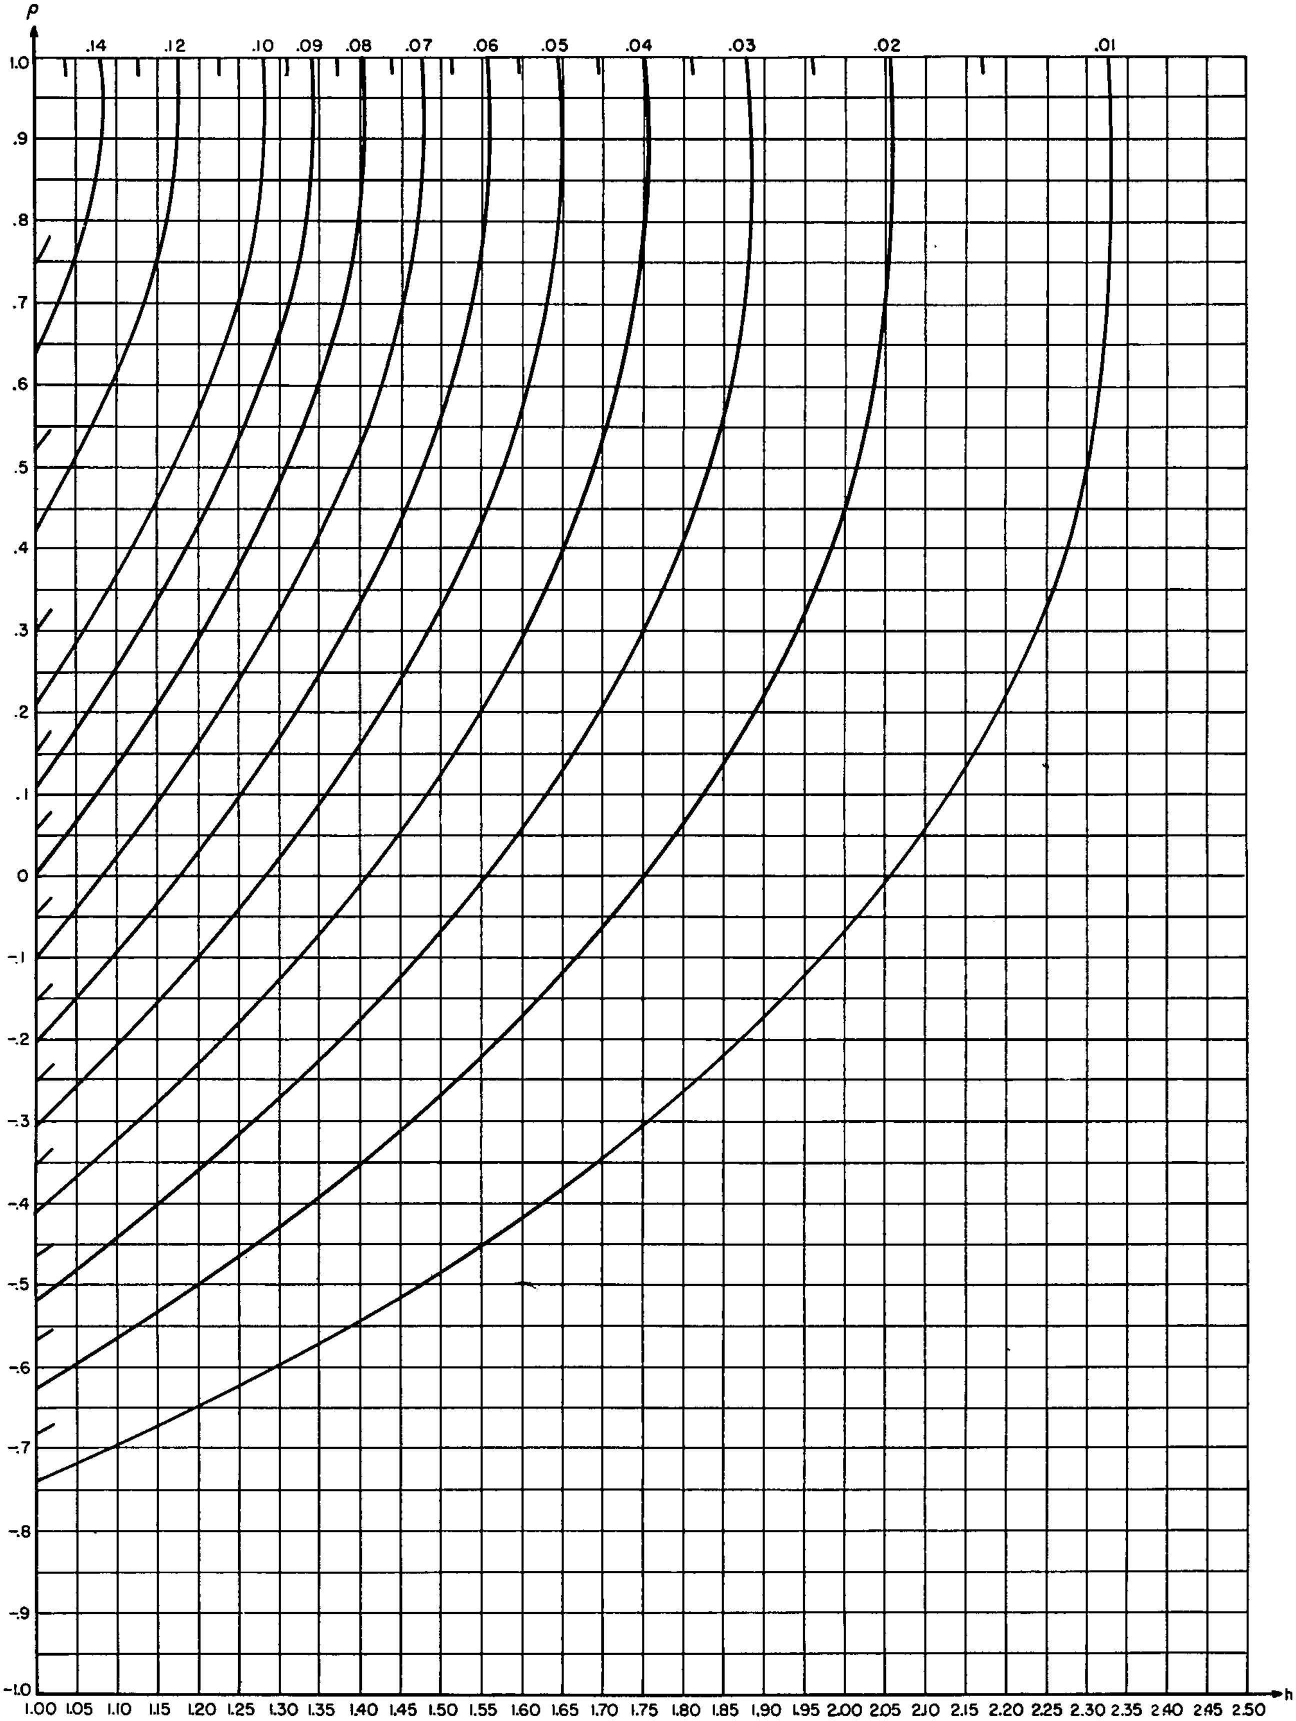

FIGURE 26.4. *$L(h, 0, \rho)$ for $h \geq 1$ and $-1 \leq \rho \leq 1$.*

Values for $h<0$ can be obtained using $L(h, 0, -\rho)=\frac{1}{2}-L(-h, 0, \rho)$.

### Integral Over an Ellipse With Center at $(m_x, m_y)$

**26.3.21**

$$\iint_A (\sigma_x\sigma_y)^{-1} g\left(\frac{x-m_x}{\sigma_x}, \frac{y-m_y}{\sigma_y}, \rho\right) dxdy = 1-e^{-a^2/2}$$

where $A$ is the area enclosed by the ellipse

$$\left(\frac{x-m_x}{\sigma_x}\right)^2 - \frac{2\rho(x-m_x)(y-m_y)}{\sigma_x\sigma_y} + \left(\frac{y-m_y}{\sigma_y}\right)^2 = a^2(1-\rho^2)$$

### Integral Over an Arbitrary Region

**26.3.22**

$$\iint_{A(x,y)} (\sigma_x\sigma_y)^{-1} g\left(\frac{x-m_x}{\sigma_x}, \frac{y-m_y}{\sigma_y}, \rho\right) dxdy = \iint_{A^*(s,t)} g(s,t,o)dsdt$$

where $A^*(s, t)$ is the transformed region obtained from the transformation

$$s = \frac{1}{\sqrt{2+2\rho}}\left(\frac{x-m_x}{\sigma_x} + \frac{y-m_y}{\sigma_y}\right)$$

$$t = \frac{-1}{\sqrt{2-2\rho}}\left(\frac{x-m_x}{\sigma_x} - \frac{y-m_y}{\sigma_y}\right)$$

### Integral of the Circular Normal Probability Function With Parameters $m_x=m_y=0$, $\sigma=1$ Over the Triangle Bounded by $y=0$, $y=ax$, $x=h$

**26.3.23**

$$V(h,ah) = \frac{1}{2\pi}\int_0^h \int_0^{ax} e^{-\frac{1}{2}(x^2+y^2)} dxdy$$

$$= \frac{1}{4} + L(h,0,\rho) - L(0,0,\rho) - \frac{1}{2} Q(h)$$

where

$$\rho = -\frac{a}{\sqrt{1+a^2}}$$

### Integral of Circular Normal Distribution Over an Offset Circle With Radius $R\sigma$ and Center a Distance $r\sigma$ From $(m_x, m_y)$

**26.3.24**

$$\int_A \int \sigma^{-2} g\left(\frac{x-m_x}{\sigma}, \frac{y-m_y}{\sigma}, 0\right) dxdy = P(R^2|2, r^2)$$

where $P(R^2|2, r^2)$ is the c.d.f. of the non-central $\chi^2$ distribution (see **26.4.25**) with $\nu=2$ degrees of freedom and noncentrality parameter $r^2$.

### Approximation to $P(R^2|2, r^2)$

|  | *Approximation* | *Condition* |
|---|---|---|
| **26.3.25** | $\frac{2R^2}{4+R^2}\exp-\frac{2r^2}{4+R^2}$ | $R<1$ |
| **26.3.26** | $P(x_1)$ | $R>1$ |
| **26.3.27** | $P(x_2)$ | $R>5$ |

$$x_1 = \frac{[R^2/(2+r^2)]^{1/3} - \left[1 - \frac{2}{9}\frac{2+2r^2}{(2+r^2)^2}\right]}{\left[\frac{2}{9}\frac{2+2r^2}{(2+r^2)^2}\right]^{\frac{1}{2}}}$$

$x_2 = R - \sqrt{r^2-1}$  $R$, $r$ both large *

### Inequality

**26.3.28**

$$Q(h) - \frac{1-\rho^2}{\rho h-k} Z(k)\left[Q\left(\frac{h-\rho k}{\sqrt{1-\rho^2}}\right)\right] < L(h,k,\rho) < Q(h)$$

where

$$\rho h - k > 0, \qquad 0<\rho<1.$$

### Series Expansion

**26.3.29**

$$L(h,k,\rho) = Q(h)Q(k) + \sum_{n=0}^{\infty} \frac{Z^{(n)}(h)Z^{(n)}(k)}{(n+1)!}\rho^{n+1}$$

## 26.4. Chi-Square Probability Function

**26.4.1**

$$P(\chi^2|\nu) = \left[2^{\nu/2}\Gamma\left(\frac{\nu}{2}\right)\right]^{-1}\int_0^{\chi^2} (t)^{\frac{\nu}{2}-1} e^{-\frac{t}{2}} dt \qquad (0 \le \chi^2 < \infty)$$

**26.4.2**

$$Q(\chi^2|\nu) = 1 - P(\chi^2|\nu) \qquad (0 \le \chi^2 < \infty)$$

$$= \left[2^{\nu/2}\Gamma\left(\frac{\nu}{2}\right)\right]^{-1}\int_{\chi^2}^{\infty} (t)^{\frac{\nu}{2}-1} e^{-\frac{t}{2}} dt$$

### Relation to Normal Distribution

Let $X_1, X_2, \ldots, X_\nu$ be independent and identically distributed random variables each following a normal distribution with mean zero and unit variance. Then $X^2 = \sum_{i=1}^{\nu} X_i^2$ is said to follow the chi-square distribution with $\nu$ degrees of freedom and the probability that $X^2 \le \chi^2$ is given by $P(\chi^2|\nu)$.

### Cumulants

**26.4.3** $\kappa_{n+1} = 2^n n! \nu \qquad (n=0, 1, \ldots)$

---

*See page II.

### Series Expansions

**26.4.4**

$$Q(\chi^2|\nu)=2Q(\chi)+2Z(\chi)\sum_{r=1}^{\frac{\nu-1}{2}}\frac{\chi^{2r-1}}{1\cdot 3\cdot 5\ldots(2r-1)}$$

$(\nu$ odd) and $\chi=\sqrt{\chi^2}$

**26.4.5**

$$Q(\chi^2|\nu)=\sqrt{2\pi}Z(\chi)\left\{1+\sum_{r=1}^{\frac{\nu-2}{2}}\frac{\chi^{2r}}{2\cdot 4\ldots(2r)}\right\}$$

$(\nu$ even)

**26.4.6**

$$P(\chi^2|\nu)=\left(\frac{1}{2}\chi^2\right)^{\nu/2}\frac{e^{-\chi^2/2}}{\Gamma\left(\frac{\nu+2}{2}\right)}$$

$$*\qquad\left\{1+\sum_{r=1}^{\infty}\frac{\chi^{2r}}{(\nu+2)(\nu+4)\cdots(\nu+2r)}\right\}$$

**26.4.7** $$P(\chi^2|\nu)=\frac{1}{\Gamma\left(\frac{\nu}{2}\right)}\sum_{n=0}^{\infty}\frac{(-1)^n(\chi^2/2)^{\frac{\nu}{2}+n}}{n!\left(\frac{\nu}{2}+n\right)}$$

### Recurrence and Differential Relations

**26.4.8** $$Q(\chi^2|\nu+2)=Q(\chi^2|\nu)+\frac{(\chi^2/2)^{\nu/2}e^{-\chi^2/2}}{\Gamma\left(\frac{\nu}{2}+1\right)}$$

**26.4.9** $$\frac{\partial^m Q(\chi^2|\nu)}{\partial(\chi^2)^m}=\frac{1}{2^m}\sum_{j=0}^{m}\binom{m}{j}(-1)^{m+j}Q(\chi^2|\nu-2j)$$

### Continued Fraction

**26.4.10** $$*Q(\chi^2|\nu)=\frac{(\chi^2)^{\nu/2}e^{-\chi^2/2}}{2^{\nu/2}\Gamma(\nu/2)}$$

$$\left\{\frac{1}{\chi^2/2+}\,\frac{1-\nu/2}{1+}\,\frac{1}{\chi^2/2+}\,\frac{2-\nu/2}{1+}\,\frac{2}{\chi^2/2+}\ldots\right\}$$

### Asymptotic Distribution for Large $\nu$

**26.4.11** $P(\chi^2|\nu)\sim P(x)$ where $x=\frac{\chi^2-\nu}{\sqrt{2\nu}}$

### Asymptotic Expansions for Large $\chi^2$

**26.4.12**

$$Q(\chi^2|\nu)\sim\frac{(\chi^2)^{\frac{\nu}{2}-1}e^{-\chi^2/2}}{2^{\nu/2}\Gamma(\nu/2)}\sum_{j=0}^{\infty}(-1)^j\frac{\Gamma\left(1-\frac{\nu}{2}+j\right)}{\Gamma\left(1-\frac{\nu}{2}\right)}\frac{2^{j+1}}{(\chi^2)^j}$$

### Approximations to the Chi-Square Distribution for Large $\nu$

**26.4.13**

| Approximation | | Condition |
|---|---|---|
| $Q(\chi^2\|\nu)\approx Q(x_1),$ | $x_1=\sqrt{2\chi^2}-\sqrt{2\nu-1}$ | $(\nu>100)$ |

**26.4.14**

$$Q(\chi^2|\nu)\approx Q(x_2),\qquad x_2=\frac{(\chi^2/\nu)^{1/3}-\left(1-\frac{2}{9\nu}\right)}{\sqrt{2/9\nu}}\qquad(\nu>30)$$

**26.4.15**

$$Q(\chi^2|\nu)\approx Q(x_2+h_\nu),\qquad h_\nu=\frac{60}{\nu}h_{60}\qquad(\nu>30)$$

*Values of $h_{60}$*

| $x$ | $h_{60}$ | $x$ | $h_{60}$ | $x$ | $h_{60}$ |
|---|---|---|---|---|---|
| −3.5 | −.0118 | −1.0 | +.0006 | +1.5 | −.0005 |
| −3.0 | −.0067 | −.5 | .0006 | 2.0 | +.0002 |
| −2.5 | −.0033 | .0 | +.0002 | 2.5 | .0017 |
| −2.0 | −.0010 | +.5 | −.0003 | 3.0 | .0043 |
| −1.5 | +.0001 | 1.0 | −.0006 | 3.5 | .0082 |

### Approximations for the Inverse Function for Large $\nu$

If $Q(\chi_p^2|\nu)=p$ and $Q(x_p)=1-P(x_p)=p$, then

| | Approximation | Condition |
|---|---|---|
| **26.4.16** | $\chi_p^2\approx\frac{1}{2}\left\{x_p+\sqrt{2\nu-1}\right\}^2$ | $(\nu>100)$ |
| **26.4.17** | $\chi_p^2\approx\nu\left\{1-\frac{2}{9\nu}+x_p\sqrt{\frac{2}{9\nu}}\right\}^3$ | $(\nu>30)$ |
| **26.4.18** | $\chi_p^2\approx\nu\left\{1-\frac{2}{9\nu}+(x_p-h_\nu)\sqrt{\frac{2}{9\nu}}\right\}^3$ | $(\nu>30)$ |

where $h_\nu$ is given by **26.4.15.**

### Relation to Other Functions

**26.4.19** Incomplete gamma function

$$\frac{\gamma(a,x)}{\Gamma(a)}=P(\chi^2|\nu),\qquad \nu=2a,\ \chi^2=2x$$

$$\frac{\Gamma(a,x)}{\Gamma(a)}=Q(\chi^2|\nu)$$

**26.4.20** Pearson's incomplete gamma function

$$I(u,p)=\frac{1}{\Gamma(p+1)}\int_0^{u\sqrt{p+1}}t^pe^{-t}dt=P(\chi^2|\nu)$$

$$\nu=2(p+1),\ \chi^2=2u\sqrt{p+1}$$

**26.4.21** Poisson distribution

$$Q(\chi^2|\nu)=\sum_{j=0}^{c-1}e^{-m}\frac{m^j}{j!},\qquad c=\frac{\nu}{2},\ m=\frac{\chi^2}{2},\ (\nu\text{ even})$$

$$Q(\chi^2|\nu)-Q(\chi^2|\nu-2)=e^{-m}\frac{m^{c-1}}{(c-1)!}$$

---

*See page II.

**26.4.22** Pearson Type III

$$\left[\frac{ab}{e}\right]^{ab}\int_{-a}^{x}\left(1+\frac{t}{a}\right)^{ab}e^{-bt}dt=P(\chi^2|\nu)$$

$$\nu=2ab+2,\ \chi^2=2b(x+a)$$

**26.4.23** Incomplete moments of Normal distribution

$$\int_0^x t^nZ(t)dt=\begin{cases}(n-1)!!\,\dfrac{P(\chi^2|\nu)}{2} & (n\ \text{even})\\[2ex] \dfrac{(n-1)!!}{\sqrt{2\pi}}\,P(\chi^2|\nu) & (n\ \text{odd})\end{cases}$$

$$\chi^2=x^2,\ \nu=n+1$$

**26.4.24** Generalized Laguerre Polynomials

$$n!L_n^{(\alpha)}(x)=\frac{\sum_{j=0}^{n+1}(-1)^{n+j}\binom{n+1}{j}Q(\chi^2|\nu+2-2j)}{2^n[Q(\chi^2|\nu+2)-Q(\chi^2|\nu)]}$$

$$x=\chi^2/2,\ \alpha=\nu/2$$

### Non-Central $\chi^2$ Distribution Function

**26.4.25**

$$P(\chi'^2|\nu,\lambda)=\sum_{j=0}^{\infty}e^{-\lambda/2}\frac{(\lambda/2)^j}{j!}P(\chi'^2|\nu+2j)$$

where $\lambda\geq 0$ is termed the non-centrality parameter.

### Relation of Non-Central $\chi^2$ Distribution With $\nu=2$ to the Integral of Circular Normal Distribution ($\sigma^2=1$) Over an Offset Circle Having Radius $R$ and Center a Distance $r=\sqrt{\lambda}$ From the Origin. (See 26.3.24–26.3.27.)

**26.4.26**

$$\iint_A g(x,y,0)\,dxdy=P(\chi^2=R^2|\nu=2,\lambda)$$

$$=1-\sum_{j=0}^{\infty}\frac{e^{-\lambda/2}\lambda^j}{2^jj!}Q(R^2|2+2j)$$

---

### Approximations to the Non-Central $\chi^2$ Distribution

$$a=\nu+\lambda\qquad b=\frac{\lambda}{\nu+\lambda}$$

| | *Approximating Function* | *Approximation* |
|---|---|---|
| **26.4.27** | $\chi^2$ distribution | $P(\chi'^2\vert\nu,\lambda)\approx P\left(\frac{\chi^2}{1+b}\Big\vert\nu^*\right),\quad \nu^*=\frac{a}{1+b}$ |
| **26.4.28** | Normal distribution | $P(\chi'^2\vert\nu,\lambda)\approx P(x),\quad x=\dfrac{(\chi'^2/a)^{1/3}-\left[1-\frac{2}{9}\left(\frac{1+b}{a}\right)\right]}{\sqrt{\frac{2}{9}\left(\frac{1+b}{a}\right)}}$ |
| **26.4.29** | Normal distribution | $P(\chi'^2\vert\nu,\lambda)\approx P(x),\quad x=\left[\frac{2\chi'^2}{1+b}\right]^{\frac{1}{2}}-\left[\frac{2a}{1+b}-1\right]^{\frac{1}{2}}$ |

### Approximations to the Inverse Function of Non-Central $\chi^2$ Distribution

If $Q(\chi_p'^2|\nu,\lambda)=p$, $Q(\chi_p^2|\nu^*)=p$, and $Q(x_p)=p$ then

| | *Approximating Variable* | *Approximation to the Inverse Function* |
|---|---|---|
| **26.4.30** | $\chi^2$ | $\chi_p'^2\approx(1+b)\chi_p^2$ |
| **26.4.31** | Normal | $\chi_p'^2\approx\frac{1+b}{2}\left[x_p+\sqrt{\frac{2a}{1+b}-1}\right]^2$ |
| **26.4.32** | Normal | $\chi_p'^2\approx a\left[x_p\sqrt{\frac{2}{9}\left(\frac{1+b}{a}\right)}+1-\frac{2}{9}\left(\frac{1+b}{a}\right)\right]^3$ |

## Properties of Chi-Square, Non-Central Chi-Square, and Related Quantities

$$a=\nu+\lambda \qquad b=\frac{\lambda}{\nu+\lambda}$$

$$\psi(z)=\frac{d}{dz}\ln\Gamma(z), \qquad \psi^{(n)}(z)=\frac{d^n}{dz^n}\psi(z)$$

## 26.5. Incomplete Beta Function

**26.5.1**

$$I_x(a,b)=\frac{1}{B(a,b)}\int_0^x t^{a-1}(1-t)^{b-1}dt \qquad (0\leq x\leq 1)$$

**26.5.2**

$$I_x(a,b)=1-I_{1-x}(b,a)$$

### Relation to the Chi-Square Distribution

If $X_1^2$ and $X_2^2$ are independent random variables following chi-square distributions **26.4.1** with $\nu_1$ and $\nu_2$ degrees of freedom respectively, then $\frac{X_1^2}{X_1^2+X_2^2}$ is said to follow a beta distribution with $\nu_1$ and $\nu_2$ degrees of freedom and has the distribution function

**26.5.3**

$$P\left\{\frac{X_1^2}{X_1^2+X_2^2}\leq x\right\}=\frac{1}{B(a,b)}\int_0^x t^{a-1}(1-t)^{b-1}dt$$

$$=I_x(a,b) \qquad a=\frac{\nu_1}{2},\ b=\frac{\nu_2}{2}$$

### Series Expansions $(0<x<1)$

**26.5.4**

$$* \quad I_x(a,b)=\frac{x^a(1-x)^b}{aB(a,b)}\left\{1+\sum_{n=0}^{\infty}\frac{B(a+1,n+1)}{B(a+b,n+1)}x^{n+1}\right\}$$

**26.5.5**

$$I_x(a,b)=\frac{x^a(1-x)^{b-1}}{aB(a,b)}\left\{1+\sum_{n=0}^{\infty}\frac{B(a+1,n+1)}{B(b-n-1,n+1)}\left(\frac{x}{1-x}\right)^{n+1}\right\}$$

$$=\frac{x^a(1-x)^{b-1}}{aB(a,b)}\left\{1+\sum_{n=0}^{s-2}\frac{B(a+1,n+1)}{B(b-n-1,n+1)}\left(\frac{x}{1-x}\right)^{n+1}\right\}+I_x(a+s,b-s)$$

**26.5.6**

$$1-I_x(a,b)=I_{1-x}(b,a)$$

$$=\frac{(1-x)^b}{B(a,b)}\sum_{i=0}^{a-1}(-1)^i\binom{a-1}{i}\frac{(1-x)^i}{b+i} \text{ (integer a)}$$

**26.5.7**

$$1-I_x(a,b)=I_{1-x}(b,a)$$

$$=(1-x)^{a+b-1}\sum_{i=0}^{a-1}\binom{a+b-1}{i}\left(\frac{x}{1-x}\right)^i \text{ (integer a)}$$

### Continued Fractions

**26.5.8**

$$I_x(a,b)=\frac{x^a(1-x)^b}{aB(a,b)}\left\{\frac{1}{1+}\frac{d_1}{1+}\frac{d_2}{1+}\cdots\right\} \qquad *$$

$$d_{2m+1}=-\frac{(a+m)(a+b+m)}{(a+2m)(a+2m+1)}x$$

$$d_{2m}=\frac{m(b-m)}{(a+2m-1)(a+2m)}x$$

Best results are obtained when $x<\frac{a-1}{a+b-2}$. Also the $4m$ and $4m+1$ convergents are less than $I_x(a,b)$ and the $4m+2$, $4m+3$ convergents are greater than $I_x(a,b)$.

**26.5.9**

$$I_x(a,b)=\frac{x^a(1-x)^{b-1}}{aB(a,b)}\left[\frac{e_1}{1+}\frac{e_2}{1+}\frac{e_3}{1+}\cdots\right]$$

$$* \quad x<1 \qquad e_1=1$$

$$e_{2m}=-\frac{(a+m-1)(b-m)}{(a+2m-2)(a+2m-1)}\frac{x}{1-x}$$

$$e_{2m+1}=\frac{m(a+b-1+m)}{(a+2m-1)(a+2m)}\frac{x}{1-x}$$

### Recurrence Relations

**26.5.10**

$$I_x(a,b)=xI_x(a-1,b)+(1-x)I_x(a,b-1)$$

**26.5.11**

$$I_x(a,b)=\frac{1}{x}\{I_x(a+1,b)-(1-x)I_x(a+1,b-1)\}$$

**26.5.12**

$$\left[I_x(a,b)=\right]\frac{1}{a(1-x)+b}\{bI_x(a,b+1)+a(1-x)I_x(a+1,b-1)\} \qquad *$$

**26.5.13**

$$I_x(a,b)=\frac{1}{a+b}\{aI_x(a+1,b)+bI_x(a,b+1)\}$$

**26.5.14**

$$I_x(a,a)=\frac{1}{2}I_{1-x'}\left(a,\frac{1}{2}\right), \qquad x'=4\left(x-\frac{1}{2}\right)^2\left[, x\leqslant\frac{1}{2}\right]^*$$

**26.5.15**

$$I_x(a,b)=\frac{\Gamma(a+b)}{\Gamma(a+1)\Gamma(b)}x^a(1-x)^{b-1}+I_x(a+1,b-1)$$

**26.5.16**

$$I_x(a,b)=\frac{\Gamma(a+b)}{\Gamma(a+1)\Gamma(b)}x^a(1-x)^b+I_x(a+1,b)$$

---

*See page II.

### Asymptotic Expansions

**26.5.17**

$$1-I_x(a,b)=I_{1-x}(b,a)\sim\frac{\Gamma(b,y)}{\Gamma(b)}$$

$$-\frac{1}{24N^2}\left\{\frac{y^be^{-y}}{(b-2)!}\,(b+1+y)\right\}$$

$$+\frac{1}{5760N^4}\left\{\frac{y^be^{-y}}{(b-2)!}\,[(b-3)(b-2)(5b+7)(b+1+y)\right.$$

$$\left.-(5b-7)(b+3+y)y^2]\right\}$$

$$y=-N\ln x,\qquad N=a+\frac{b}{2}-\frac{1}{2}$$

**26.5.18**

$$I_x(a,b)\sim\frac{\Gamma(a,w)}{\Gamma(a)}+\frac{e^{-w}w^a}{\Gamma(a)}\left\{\frac{(a-1-w)}{2b}\right.$$

$$+\frac{1}{(2b)^2}\left(\frac{a^3}{2}-\frac{5}{3}a^2+\frac{3}{2}a-\frac{1}{3}-w\left[\frac{3}{2}a^2-\frac{11}{6}a+\frac{1}{3}\right]\right.$$

$$\left.\left.+w^2\left(\frac{3}{2}a-\frac{1}{6}\right)-\frac{1}{2}w^3\right)\right\}$$

$$w=b\left(\frac{x}{1-x}\right)$$

**26.5.19**

$$I_x(a,b)\sim P(y)-Z(y)\left[a_1+\frac{a_2(y-a_1)}{1+a_2}\right.$$

$$\left.+\frac{a_3(1+y^2/2)}{1+a_2}+\cdots\right]$$

$$a_1=\frac{2}{3}\,(b-a)[(a+b-2)(a-1)(b-1)]^{-½}$$

$$a_2=\frac{1}{12}\left[\frac{1}{a-1}+\frac{1}{b-1}-\frac{13}{a+b-1}\right]$$

$$a_3=-\frac{8}{15}\left[a_1\left(a_2+\frac{3}{a+b-2}\right)\right]$$

$$y^2=2\left[(a+b-1)\ln\frac{a+b-1}{a+b-2}+(a-1)\ln\frac{a-1}{(a+b-1)x}\right.$$

$$\left.+(b-1)\ln\frac{b-1}{(a+b-1)(1-x)}\right]$$

and $y$ is taken negative when $x<\frac{a-1}{a+b-2}$

### Approximations

**26.5.20** If $(a+b-1)(1-x)\leq .8$

$$I_x(a,\,b)=Q(\chi^2|\nu)+\epsilon,$$

$$|\epsilon|<5\times10^{-3}\text{ if }a+b>6$$

$$\chi^2=(a+b-1)(1-x)(3-x)-(1-x)(b-1),$$

$$\nu=2b$$

**26.5.21** If $(a+b-1)(1-x)\geq .8$

$$I_x(a,\,b)=P(y)+\epsilon,$$

$$|\epsilon|<5\times10^{-3}\text{ if }a+b>6$$

$$y=\frac{3\left[w_1\left(1-\frac{1}{9b}\right)-w_2\left(1-\frac{1}{9a}\right)\right]}{\left[\frac{w_1^2}{b}+\frac{w_2^2}{a}\right]^{\frac{1}{2}}},$$

$$w_1=(bx)^{1/3},\ w_2=[a(1-x)]^{1/3}$$

### Approximation to the Inverse Function

**26.5.22** If $I_{x_p}(a,\,b)=p$ and $Q(y_p)=p$ then

$$x_p\approx\frac{a}{a+be^{2w}}$$

$$w=\frac{y_p(h+\lambda)^{\frac{1}{2}}}{h}-\left(\frac{1}{2b-1}-\frac{1}{2a-1}\right)\left(\lambda+\frac{5}{6}-\frac{2}{3h}\right)$$

$$h=2\left(\frac{1}{2a-1}+\frac{1}{2b-1}\right)^{-1},\qquad\lambda=\frac{y_p^2-3}{6}$$

### Relations to Other Functions and Distributions

| | *Function* | *Relation* |
|---|---|---|
| **26.5.23** | Hypergeometric function | $\frac{1}{B(a,\,b)}\,\frac{x^a}{a}\,F(a,\,1-b;\,a+1;\,x)=I_x(a,\,b)$ |
| **26.5.24** | Binomial distribution | $\sum_{s=a}^{n}\binom{n}{s}p^s(1-p)^{n-s}=I_p(a,\,n-a+1)$ |
| **26.5.25** | " | $\binom{n}{a}p^a(1-p)^{n-a}=I_p(a,\,n-a+1)-I_p(a+1,\,n-a)$ * |
| **26.5.26** | Negative binomial distribution | $\sum_{s=a}^{n}\binom{n+s-1}{s}p^nq^s=I_q(a,\,n)$ |
| **26.5.27** | Student's distribution | $\frac{1}{2}[1-A(t\|\nu)]=\frac{1}{2}\,I_x\left(\frac{\nu}{2},\frac{1}{2}\right),\qquad x=\frac{\nu}{\nu+t^2}$ * |
| **26.5.28** | $F$-(variance-ratio) distribution | $Q(F\|\nu_1,\nu_2)=I_x\left(\frac{\nu_2}{2},\,\frac{\nu_1}{2}\right),\qquad x=\frac{\nu_2}{\nu_2+\nu_1F}$ |

---

*See page II.

## 26.6. *F*-(Variance-Ratio) Distribution Function

**26.6.1**

$$P(F|\nu_1,\nu_2)=\frac{\nu_1^{\frac{1}{2}\nu_1}\nu_2^{\frac{1}{2}\nu_2}}{B\left(\frac{1}{2}\nu_1,\frac{1}{2}\nu_2\right)}\int_0^F t^{\frac{1}{2}(\nu_1-2)}(\nu_2+\nu_1 t)^{-\frac{1}{2}(\nu_1+\nu_2)}dt \qquad (F\geq 0)$$

**26.6.2**

$$Q(F|\nu_1,\nu_2)=1-P(F|\nu_1,\nu_2)=I_x\left(\frac{\nu_2}{2},\frac{\nu_1}{2}\right)$$

where

$$x=\frac{\nu_2}{\nu_2+\nu_1 F}$$

### Relation to the Chi-Square Distribution

If $X_1^2$ and $X_2^2$ are independent random variables following chi-square distributions **26.4.1** with $\nu_1$ and $\nu_2$ degrees of freedom respectively, then the distribution of $F=\frac{X_1^2/\nu_1}{X_2^2/\nu_2}$ is said to follow the variance ratio or $F$-distribution with $\nu_1$ and $\nu_2$ degrees of freedom. The corresponding distribution function is $P(F|\nu_1,\nu_2)$.

### Statistical Properties

**26.6.3**

mean: $$m=\frac{\nu_2}{\nu_2-2} \qquad (\nu_2>2)$$

variance: $$\sigma^2=\frac{2\nu_2^2(\nu_1+\nu_2-2)}{\nu_1(\nu_2-2)^2(\nu_2-4)} \qquad (\nu_2>4)$$

third central moment:

$$\mu_3=\left(\frac{\nu_2}{\nu_1}\right)^3\frac{8\nu_1(\nu_1+\nu_2-2)(2\nu_1+\nu_2-2)}{(\nu_2-2)^3(\nu_2-4)(\nu_2-6)} \qquad (\nu_2>6)$$

moments about the origin:

$$\mu_n'=\left(\frac{\nu_2}{\nu_1}\right)^n\frac{\Gamma\left(\frac{\nu_1+2n}{2}\right)}{\Gamma\left(\frac{\nu_1}{2}\right)}\frac{\Gamma\left(\frac{\nu_1-2n}{2}\right)}{\Gamma\left(\frac{\nu_2}{2}\right)} \qquad (\nu_2>2n)$$

characteristic function:

$$\phi(t)=E(e^{iFt})=M\left(\frac{\nu_1}{2},-\frac{\nu_2}{2},-\frac{\nu_2}{\nu_1}it\right)$$

### Series Expansions

$$x=\frac{\nu_2}{\nu_2+\nu_1 F}$$

**26.6.4**

* $$Q(F|\nu_1,\nu_2)=x^{\nu_2/2}\left[1+\frac{\nu_2}{2}(1-x)+\frac{\nu_2(\nu_2+2)}{2\cdot 4}(1-x)^2+\dots+\frac{\nu_2(\nu_2+2)\dots(\nu_2+\nu_1-4)}{2\cdot 4\dots(\nu_1-2)}(1-x)^{\frac{\nu_1-2}{2}}\right] \qquad (\nu_1\text{ even})$$

**26.6.5**

$$Q(F|\nu_1,\nu_2)=1-(1-x)^{\nu_1/2}\left[1+\frac{\nu_1}{2}x+\frac{\nu_1(\nu_1+2)}{2\cdot 4}x^2+\dots+\frac{\nu_1(\nu_1+2)\dots(\nu_2+\nu_1-4)}{2\cdot 4\dots(\nu_2-2)}x^{\frac{\nu_2-2}{2}}\right] \qquad (\nu_2\text{ even})$$

**26.6.6**

$$Q(F|\nu_1,\nu_2)=x^{\frac{\nu_1+\nu_2-2}{2}}\left[1+\frac{\nu_1+\nu_2-2}{2}\left(\frac{1-x}{x}\right)+\frac{(\nu_1+\nu_2-2)(\nu_1+\nu_2-4)}{2\cdot 4}\left(\frac{1-x}{x}\right)^2+\dots+\frac{(\nu_1+\nu_2-2)\dots(\nu_2+2)}{2\cdot 4\dots(\nu_1-2)}\left(\frac{1-x}{x}\right)^{\frac{\nu_1-2}{2}}\right] \qquad (\nu_1\text{ even})$$

**26.6.7**

$$Q(F|\nu_1,\nu_2)=1-(1-x)^{\frac{\nu_1+\nu_2-2}{2}}\left[1+\frac{\nu_1+\nu_2-2}{2}\left(\frac{x}{1-x}\right)+\dots+\frac{(\nu_1+\nu_2-2)\dots(\nu_1+2)}{2\cdot 4\dots(\nu_2-2)}\left(\frac{x}{1-x}\right)^{\frac{\nu_2-2}{2}}\right] \qquad (\nu_2\text{ even})$$

**26.6.8**

$$Q(F|\nu_1,\nu_2)=1-A(t|\nu_2)+\beta(\nu_1,\nu_2) \qquad (\nu_1,\nu_2\text{ odd})$$

$$A(t|\nu_2)=\begin{cases}\frac{2}{\pi}\left\{\theta+\sin\theta\left[\cos\theta+\frac{2}{3}\cos^3\theta+\dots+\frac{2\cdot 4\dots(\nu_2-3)}{3.5\dots(\nu_2-2)}\cos^{\nu_2-2}\theta\right]\right\} & \text{for }\nu_2>1\\ \frac{2\theta}{\pi}\text{ for }\nu_2=1\end{cases}$$

$$\beta(\nu_1,\nu_2)=\begin{cases}\frac{2}{\sqrt{\pi}}\frac{\left(\frac{\nu_2-1}{2}\right)!}{\left(\frac{\nu_2-2}{2}\right)!}\sin\theta\cos^{\nu_2}\theta\left\{1+\frac{\nu_2+1}{3}\sin^2\theta+\dots+\frac{(\nu_2+1)(\nu_2+3)\dots(\nu_1+\nu_2-4)\sin^{\nu_1-3}\theta}{3\cdot 5\dots(\nu_1-2)}\right\} & \text{for }\nu_2>1\\ 0\text{ for }\nu_1=1 \quad * \end{cases}$$

where

$$\theta=\arctan\sqrt{\frac{\nu_1}{\nu_2}F}$$

### Reflexive Relation

If $F_p(\nu_1,\nu_2)$ and $F_{1-p}(\nu_2,\nu_1)$ satisfy

$$Q(F_p(\nu_1,\nu_2)|\nu_1,\nu_2)=p$$

$$Q(F_{1-p}(\nu_2,\nu_1)|\nu_2,\nu_1)=1-p$$

---

*See page II.

**26.6.9** then

$$F_p(\nu_1,\nu_2)=\frac{1}{F_{1-p}(\nu_2,\nu_1)}$$

### Relation to Student's *t*-Distribution Function (See 26.7)

**26.6.10** $Q(F|\nu_1=1,\nu_2)=1-A(t|\nu_2) \qquad t=\sqrt{F}$

### Limiting Forms

**26.6.11**

$$\lim_{\nu_2\to\infty} Q(F|\nu_1,\nu_2)=Q(\chi^2|\nu_1), \qquad \chi^2=\nu_1 F$$

**26.6.12**

$$\lim_{\nu_1\to\infty} Q(F|\nu_1,\nu_2)=P(\chi^2|\nu_2), \qquad \chi^2=\frac{\nu_2}{F}$$

### Approximations

**26.6.13**

$$Q(F|\nu_1,\nu_2)\approx Q(x), \qquad x=\frac{F-\dfrac{\nu_2}{\nu_2-2}}{\dfrac{\nu_2}{\nu_2-2}\sqrt{\dfrac{2(\nu_1+\nu_2-2)}{\nu_1(\nu_2-4)}}}$$

($\nu_1$ and $\nu_2$ large)

**26.6.14**

$$Q(F|\nu_1,\nu_2)\approx Q(x), \qquad x=\frac{\sqrt{(2\nu_2-1)\dfrac{\nu_1}{\nu_2}F}-\sqrt{2\nu_1-1}}{\sqrt{1+\dfrac{\nu_1}{\nu_2}F}}$$

**26.6.15**

$$Q(F|\nu_1,\nu_2)\approx Q(x), \qquad x=\frac{F^{1/3}\left(1-\dfrac{2}{9\nu_2}\right)-\left(1-\dfrac{2}{9\nu_1}\right)}{\sqrt{\dfrac{2}{9\nu_1}+F^{2/3}\dfrac{2}{9\nu_2}}}$$

### Approximation to the Inverse Function

**26.6.16** If $Q(F_p|\nu_1,\nu_2)=p$, then

$F_p\approx e^{2w}$ where $w$ is given by **26.5.22,** with

$$\nu_1=2b,\ \nu_2=2a$$

### Non-Central *F*-Distribution Function

**26.6.17**

$$P(F'|\nu_1,\nu_2,\lambda)=\int_0^{F'} p(t|\nu_1,\nu_2,\lambda)dt=1-Q(F'|\nu_1,\nu_2,\lambda)$$

where

$$p(t|\nu_1,\nu_2,\lambda)=\sum_{j=0}^{\infty} e^{-\lambda/2}\frac{(\lambda/2)^j}{j!}\frac{(\nu_1+2j)^{\frac{\nu_1+2j}{2}}\nu_2^{\nu_2/2}}{B\left(\dfrac{\nu_1+2j}{2},\dfrac{\nu_2}{2}\right)}$$

$$\times t^{\frac{\nu_1+2j-2}{2}}[\nu_2+(\nu_1+2j)t]^{-(\nu_1+2j+\nu_2)/2}$$

and $\lambda\geq 0$ is termed the non-centrality parameter.

### Relation of Non-Central *F*-Distribution Function to Other Functions

| | *Function* | *Relation* |
|---|---|---|
| **26.6.18** | *F*-distribution | $P(F'\|\nu_1,\nu_2,\lambda)=\sum_{j=0}^{\infty} e^{-\lambda/2}\frac{(\lambda/2)^j}{j!}P(F'\|\nu_1+2j,\nu_2)$<br>$P(F'\|\nu_1,\nu_2,\lambda=0)=P(F'\|\nu_1,\nu_2)$ |
| **26.6.19** | Non-central *t*-distribution | $P(F'\|\nu_1=1,\nu_2,\lambda)=P(t'\|\nu,\delta),\ t'=\sqrt{F'},\ \nu=\nu_2,\ \delta=\sqrt{\lambda}$ |
| **26.6.20** | Incomplete Beta function | $P(F'\|\nu_1,\nu_2)=\sum_{j=0}^{\infty} e^{-\lambda/2}\frac{(\lambda/2)^j}{j!}I_x\left(\frac{\nu_1}{2}+j,\frac{\nu_2}{2}\right),$<br>$x=\frac{\nu_1 F'}{\nu_1 F'+\nu_2}$ * |
| **26.6.21** | Confluent hypergeometric function | $P(F'\|\nu_1,\nu_2,\lambda)=\sum_{i=0}^{\frac{\nu_2}{2}-1}\frac{2e^{-\lambda/2}}{(\nu_1+\nu_2)B\left(\frac{\nu_1}{2}+i+1,\frac{\nu_2}{2}-i\right)}\times$<br>$x^{\frac{\nu_1}{2}+1}(1-x)^{\frac{\nu_2}{2}-i-1}M\left(\frac{\nu_1+\nu_2}{2},\frac{\nu_1}{2}+i+1,\frac{\lambda x}{2}\right)$<br>$\left(\nu_2 \text{ even and } x=\frac{\nu_2}{\nu_1 F'+\nu_2}\right)$ |

### Series Expansion

**26.6.22**

$$P(F'|\nu_1,\nu_2,\lambda)=e^{-\frac{\lambda}{2}(1-x)}\;x^{\frac{1}{2}(\nu_1+\nu_2-2)}\sum_{i=0}^{\frac{\nu_2}{2}-1}T_i\qquad(\nu_2\text{ even})$$

where

$$T_0=1$$

$$T_1=\frac{1}{2}(\nu_1+\nu_2-2+\lambda x)\frac{1-x}{x}$$

$$T_i=\frac{1-x}{2i}[(\nu_1+\nu_2-2i+\lambda x)T_{i-1}+\lambda(1-x)T_{i-2}]$$

$$x=\frac{\nu_2}{\nu_1F'+\nu_2}$$

### Limiting Forms

**26.6.23**

$$\lim_{\nu_2\to\infty}P(F'|\nu_1,\nu_2,\lambda)=P(\chi'^2|\nu,\lambda),\qquad\chi'^2=\nu_1F',\ \nu=\nu_1$$

**26.6.24**

$$\lim_{\nu_1\to\infty}P(F'|\nu_1,\nu_2,\lambda)=Q(\chi^2|\nu),\qquad\chi^2=\frac{\nu_2(1+c^2)}{F'}$$

where $\lambda/\nu_1\to c^2$ as $\nu_1\to\infty$.

### Approximations to the Non-Central *F*-Distribution

**26.6.25** $P(F'|\nu_1,\nu_2,\lambda)\approx P(x_1)$, ($\nu_1$ and $\nu_2$ large)

where

$$x_1=\frac{F'-\dfrac{\nu_2(\nu_1+\lambda)}{\nu_1(\nu_2-2)}}{\dfrac{\nu_2}{\nu_1}\left[\dfrac{2}{(\nu_2-2)(\nu_2-4)}\left\{\dfrac{(\nu_1+\lambda)^2}{\nu_2-2}+\nu_1+2\lambda\right\}\right]^{\frac{1}{2}}}$$

**26.6.26**

$$P(F'|\nu_1,\nu_2,\lambda)\approx P(F|\nu_1^*,\nu_2),$$

$$F=\frac{\nu_1}{\nu_1+\lambda}F',\ \nu_1^*=\frac{(\nu_1+\lambda)^2}{\nu_1+2\lambda}$$

**26.6.27**

$$P(F'|\nu_1,\nu_2,\lambda)\approx P(x_2),$$

$$x_2=\frac{\left[\dfrac{\nu_1F'}{(\nu_1+\lambda)}\right]^{1/3}\left[1-\dfrac{2}{9\nu_2}\right]-\left[1-\dfrac{2(\nu_1+2\lambda)}{9(\nu_1+\lambda)^2}\right]}{\left[\dfrac{2}{9}\dfrac{\nu_1+2\lambda}{(\nu_1+\lambda)^2}+\dfrac{2}{9\nu_2}\left(\dfrac{\nu_1}{\nu_1+\lambda}F'\right)^{2/3}\right]^{\frac{1}{2}}}$$

## 26.7. Student's *t*-Distribution

If $X$ is a random variable following a normal distribution with mean zero and variance unity, and $\chi^2$ is a random variable following an independent chi-square distribution with $\nu$ degrees of freedom, then the distribution of the ratio $\frac{X}{\sqrt{\chi^2/\nu}}$ is called Student's *t*-distribution with $\nu$ degrees of freedom. The probability that $\frac{X}{\sqrt{\chi^2/\nu}}$ will be less in absolute value than a fixed constant $t$ is

**26.7.1**

$$A(t|\nu)=P_r\left\{\left|\frac{X}{\sqrt{\chi^2/\nu}}\right|\leq t\right\}$$

$$=\left[\sqrt{\nu}B\left(\frac{1}{2},\frac{\nu}{2}\right)\right]^{-1}\int_{-t}^{t}\left(1+\frac{x^2}{\nu}\right)^{-\frac{\nu+1}{2}}dx$$

$$=1-I_x\left(\frac{\nu}{2},\frac{1}{2}\right),\qquad(0\leq t<\infty)\quad *$$

where

$$x=\frac{\nu}{\nu+i^2}$$

### Statistical Properties

**26.7.2**

mean: $m=0$

variance: $\sigma^2=\frac{\nu}{\nu-2}$ $(\nu>2)$

skewness: $\gamma_1=0$

excess: $\gamma_2=\frac{6}{\nu-4}$ $(\nu>4)$

moments:

$$\mu_{2n}=\frac{1\cdot3\ldots(2n-1)\nu^n}{(\nu-2)(\nu-4)\ldots(\nu-2n)}\qquad(\nu>2n)$$

$$\mu_{2n+1}=0$$

characteristic function:

$$\phi(t)=E\left[\exp\left(it\frac{X}{\sqrt{\chi^2/\nu}}\right)\right]=\frac{\left(\frac{|t|}{2\sqrt{\nu}}\right)^{\nu/2}}{\pi\Gamma(\nu/2)}Y_{\frac{\nu}{2}}\left(\frac{|t|}{\sqrt{\nu}}\right)$$

### Series Expansions

$$\left(\theta=\arctan\frac{t}{\sqrt{\nu}}\right)$$

**26.7.3**

$$A(t|\nu)=\begin{cases}\dfrac{2}{\pi}\left\{\theta+\sin\theta\left[\cos\theta+\dfrac{2}{3}\cos^3\theta+\ldots+\dfrac{2\cdot4\ldots(\nu-3)}{1\cdot3\ldots(\nu-2)}\cos^{\nu-2}\theta\right]\right\}\quad * & (\nu>1\text{ and odd})\\[2ex]\dfrac{2}{\pi}\theta & (\nu=1)\end{cases}$$

**26.7.4**

$$A(t|\nu)=\sin\theta\left\{1+\frac{1}{2}\cos^2\theta+\frac{1\cdot3}{2\cdot4}\cos^4\theta+\ldots+\frac{1\cdot3\cdot5\ldots(\nu-3)}{2\cdot4\cdot6\ldots(\nu-2)}\cos^{\nu-2}\theta\right\}\qquad(\nu\text{ even})\ *$$

---

*See page II.

### Asymptotic Expansion for the Inverse Function

If $A(t_p|\nu)=1-2p$ and $Q(x_p)=p$, then

**26.7.5**

$$t_p\sim x_p+\frac{g_1(x_p)}{\nu}+\frac{g_2(x_p)}{\nu^2}+\frac{g_3(x_p)}{\nu^3}+\ldots$$

$$g_1(x)=\frac{1}{4}\,(x^3+x)$$

$$g_2(x)=\frac{1}{96}\,(5x^5+16x^3+3x)$$

$$g_3(x)=\frac{1}{384}\,(3x^7+19x^5+17x^3-15x)$$

$$g_4(x)=\frac{1}{92160}\,(79x^9+776x^7+1482x^5-1920x^3-945x)$$

### Limiting Distribution

**26.7.6**

$$\lim_{\nu\to\infty} A(t|\nu)=\frac{1}{\sqrt{2\pi}}\int_{-t}^{t} e^{-x^2/2}dx=A(t)$$

### Approximation for Large Values of $t$ and $\nu\leq 5$

**26.7.7** $$A(t|\nu)\approx 1-2\left\{\frac{a_\nu}{t^\nu}+\frac{b_\nu}{t^{\nu+1}}\right\}$$

| $\nu$ | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|
| $a_\nu$ | .3183 | .4991 | 1.1094 | 3.0941 | 9.948 |
| $b_\nu$ | .0000 | .0518 | −.0460 | −2.756 | −14.05 |

### Approximation for Large $\nu$

**26.7.8** $$A(t|\nu)\approx 2P(x)-1,\qquad x=\frac{t\left(1-\frac{1}{4\nu}\right)}{\sqrt{1+\frac{t^2}{2\nu}}}$$

### Non-Central $t$-Distribution

**26.7.9**

$$P(t'|\nu,\,\delta)=$$

$$\frac{1}{\sqrt{\nu}B\left(\frac{1}{2},\frac{\nu}{2}\right)}\int_{-\infty}^{t'}\left(\frac{\nu}{\nu+x^2}\right)^{\frac{\nu+1}{2}} e^{-\frac{1}{2}\frac{\nu\delta^2}{\nu+x^2}}Hh_\nu\left(\frac{-\delta x}{\sqrt{\nu+x^2}}\right)dx$$

$$=1-\sum_{j=0}^{\infty} e^{-\delta^2/2}\,\frac{(\delta^2/2)^j}{2j!}\,I_x\left(\frac{\nu}{2},\frac{1}{2}+j\right),\qquad x=\frac{\nu}{\nu+t'^2}\;*$$

where $\delta$ is termed the non-centrality parameter.

### Approximation to the Non-Central $t$-Distribution

**26.7.10**

$$P(t'|\nu,\,\delta)\approx P(x)\qquad \text{where } x=\frac{t'\left(1-\frac{1}{4\nu}\right)-\delta}{\left(1+\frac{t'^2}{2\nu}\right)^{\frac{1}{2}}}$$

# Numerical Methods

## 26.8. Methods of Generating Random Numbers and Their Applications [9]

Random digits are digits generated by repeated independent drawings from the population 0, 1, 2, . . ., 9 where the probability of selecting any digit is one-tenth. This is equivalent to putting 10 balls, numbered from 0 to 9, into an urn and drawing one ball at a time, replacing the ball after each drawing. The recorded set of numbers forms a collection of random digits. Any group of $n$ successive random digits is known as a *random number.*

Several lengthy tables of random digits are available (see references). However, the use of random numbers in electronic computers has resulted in a need for random numbers to be generated in a completely deterministic way. The numbers so generated are termed pseudo-random numbers. The quality of pseudo-random numbers is determined by subjecting the numbers to several statistical tests, see [26.55], [26.56]. The purpose of these statistical tests is to detect any properties of the pseudo-random numbers which are different from the (conceptual) properties of random numbers.

Experience has shown that the congruence method is the most preferable device for generating random numbers on a computer. Let the sequence of pseudo-random numbers be denoted by $\{X_n\}$, $n=0,\ 1,\ 2,\ \ldots.$ Then the congruence method of generating pseudo-random numbers is

$$X_{n+1}=aX_n+b(\text{mod } T)$$

where $b$ and $T$ are relatively prime. The choice of $T$ is determined by the capacity and base of the computer; $a$ and $b$ are chosen so that: (1) the resulting sequence $\{X_n\}$ possesses the desired statistical properties of random numbers, (2) the period of the sequence is as long as possible, and (3) the speed of generation is fast. A guide for choosing $a$ and $b$ is to make the correlation between the numbers be near zero, e.g., the correlation between $X_n$ and $X_{n+s}$ is

$$\rho_s=\frac{1-6\frac{b_s}{T}\left(1-\frac{b_s}{T}\right)}{a_s}+e$$

where

$a_s=a^s\ (\text{mod } T)$

$b_s=(1+a+a^2+\ \ldots\ +a^{s-1})b\ (\text{mod } T)$

$|e|<a_s/T$

---

[9] The authors wish to express their appreciation to Professor J. W. Tukey who made many penetrating and helpful suggestions in this section.

*See page II.

which occur in

$$X_{n+s}=a_sX_n+b_s \pmod{T}$$

When $a$ is chosen so that $a\approx T^{1/2}$, the correlation $\rho_1\approx T^{-1/2}$.

The sequence defined by the multiplicative congruence method will have a full period of $T$ numbers if

(i) $b$ is relatively prime to $T$
(ii) $a\equiv 1 \pmod p$ if $p$ is a prime factor of $T$
(iii) $a\equiv 1 \pmod 4$ if 4 is a factor of $T$.

Consequently if $T=2^q$, $b$ need only be odd, and $a\equiv 1 \pmod 4$. When $T=10^q$, $b$ need only be not divisible by 2 or 5, and $a\equiv 1 \pmod{20}$. The most convenient choices for $a$ are of the form $a=2^s+1$ (for binary computers) and $a=10^s+1$ (for decimal computers). This results in the fastest generation of random numbers as the operations only require a shift operation plus two additions. Also any number can serve as the starting point to generate a sequence of random digits. A good summary of generating pseudo-random numbers is [26.51].

Below are listed various congruence schemes and their properties.

*Congruence methods for generating random numbers*

$X_{n+1}\equiv aX_n+b \pmod T$, $T$ and $b$ relatively prime

| | $a$ | $b$ | $T$ | Period | $X_0$ | Special cases for which random numbers have passed statistical tests for randomness[10] |
|---|---|---|---|---|---|---|
| **26.8.1** | $1+t^s$ | odd | $T=t^q$ | $t^q$ | $0\leq X_0<T$ | $T=2^{35}$, $X_0$ unknown; $a=2^7+1$, $b=1$; $T=2^{47}$, $a=2^9+1$, $b=29741\ 09625\ 8473$, $X_0=76293\ 94531\ 25$. |
| **26.8.2** | $r2^s\pm 1$ ($r$ odd, $s\geq 2$) | 0 | $T=t^q$ | $t^{q-s}$ | relatively prime to $T$ | $T=2^{40}, 2^{42}$, $X_0=1$; $a=5^{17}(s=2)$<br>$T=2^{36}$, $X_0=1$; $T=2^{39}$, $X_0=1-2^{-39}$, $.5478126193$; $a=5^{13}(s=2)$<br>$T=2^{35}$, $X_0=1$; $a=5^{15}(s=2)$ |
| **26.8.3** | $r2^s\pm 1$ ($r$ odd, $s\geq 2$) | 0 | $T=t^q\pm 1$ | (varies) | relatively prime to $T$ | $T=2^{35}+1$, $X_0=10{,}987{,}654{,}321$; $a=23$; period $\approx 10^8$<br>$T=10^8+1$, $X_0=47{,}594{,}118$; $a=23$; period $\approx 5.8\times 10^6$ |
| **26.8.4** | $7^{4s+1}$ | 0 | $T=10^q$ | $5\cdot 10^{q-3}$ | relatively prime to $T$ | $T=10^{10}$, $X_0=1$; $a=7$<br>$T=10^{11}$, $X_0=1$; $a=7^{13}$ |
| **26.8.5** | $3^{4s+1}$ ($s=0, 2, 3, 4$) | 0 | $T=10^q$ | $5\cdot 10^{q-3}$ | relatively prime to $T$ | |

[10] $X_0$ given is the starting point for random numbers when statistical tests were made.

When the numbers are generated using a congruence scheme, the least significant digits have short periods. Hence the entire word length cannot be used. If one desired random numbers with as many digits as possible, one would have to modify the congruence schemes. One way is to generate the numbers mod $T\pm 1$. This unfortunately reduces the period. *

## Generation of Random Deviates

Let $\{X\}$ be a generated sequence of independent random numbers having the domain $(0, T)$. Then $\{U\}=\{T^{-1}X\}$ is a sequence of random deviates (numbers) from a uniform distribution on the interval (0, 1). This is usually a necessary preliminary step in the generation of random deviates having a given cumulative distribution function $F(y)$ or probability density function $f(y)$. Below are summarized some general techniques for producing arbitrary random deviates. (In what follows $\{U\}$ will always denote a sequence of random deviates from a uniform distribution on the interval (0, 1).)

### 1. Inverse Method

The solutions $\{y\}$ of the equations $\{u=F(y)\}$ form a sequence of independent random deviates with cumulative distribution function $F(y)$. (If $F(y)$ has a discontinuity at $y=y_0$, then whenever $u$ is such that $F(y_0-0)<u<F(y_0)$, select $y_0$ as the corresponding deviate.) Generally the inverse method is not practical unless the inverse function $y=F^{-1}(u)$ can be obtained explicitly or can be conveniently approximated.

### 2. Generating a Discrete Random Variable

Let $Y$ be a discrete random variable with point probabilities $p_i=Pr\{Y=y_i\}$ for $i=1, 2, \ldots$.

---

*See page II.

The direct way to generate $Y$ is to generate $\{U\}$ and put $Y=y_i$ if

$$p_1+p_2+ \dots +p_{i-1}<U<p_1+p_2+ \dots +p_i.$$

However, this method requires complicated machine programs that take too long.

An alternative way due to Marsaglia [26.53] is simple, fast, and seems to be well suited to high-speed computations. Let $p_i$ for $i=1, 2, \dots, n$ be expressed by $k$ decimal digits as $p_i=.\delta_{1i}\delta_{2i} \dots \delta_{ki}$ where the $\delta$'s are the decimal digits. (If the domain of the random variable is infinite, it is necessary to truncate the probability distribution at $p_n$.) Define

$$P_0=0,\ P_r=10^{-r}\sum_{i=1}^{n}\delta_{ri} \text{ for } r=1, 2, \dots, k, \text{ and}$$

$$\Pi_s=\sum_{r=0}^{s}10^rP_r,\ s=1, 2, \dots, k.$$

Number the computer memory locations by 0, 1, 2, . . . , $\Pi_k-1$. The memory locations are divided into $k$ mutually exclusive sets such that the $s$th set consists of memory locations $\Pi_{s-1}$, $\Pi_{s-1}+1, \dots, \Pi_s-1$. The information stored in the memory locations of the $s$th set consists of $y_1$ in $\delta_{s1}$ locations, $y_2$ in $\delta_{s2}$ locations, . . . , $y_n$ in $\delta_{sn}$ locations.

Denote the decimal expansion of the uniform deviates generated by the computer by $u=\cdot d_1d_2d_3 \dots$ and finally let $a\{m\}$ be the contents of memory location $m$. Then if

$$\sum_{i=0}^{s-1}P_i\leq U<\sum_{i=0}^{s}P_i$$

put

$$y=a\left\{d_1d_2 \dots d_s+\Pi_{s-1}-10^s\sum_{i=1}^{s-1}P_i\right\}.$$

This method is perhaps the best all-around method for generating random deviates from a discrete distribution. In order to illustrate this method consider the problem of generating deviates from the binomial distribution with point probabilities

$$p_i=\binom{n}{i}p^i(1-p)^{n-i}$$

for $n=5$ and $p=.20$. The point probabilities to 4 D are

| *Value of Random Variable* | *Point Probabilities* |
|---|---|
| 0 | $p_0=0.3277$ |
| 1 | $p_1=\ .4096$ |
| 2 | $p_2=\ .2048$ |
| 3 | $p_3=\ .0512$ |
| 4 | $p_4=\ .0064$ |
| 5 | $p_5=\ .0003$ |

and thus $P_0=0$, $P_1=.9$, $P_2=.07$, $P_3=.027$, $P_4=.0030$ from which $\Pi_0=0$, $\Pi_1=9$, $\Pi_2=16$, $\Pi_3=43$, $\Pi_4=73$. The 73 memory locations are divided into 4 mutually exclusive sets such that

| *Set* | *Memory Locations* |
|---|---|
| 1 | 0, 1, . . . , 8 |
| 2 | 9, 10, . . . , 15 |
| 3 | 16, . . . , 42 |
| 4 | 43, . . . , 72 |

Among the nine memory locations of set 1, zero is stored $\delta_{10}=3$ times, 1 is stored $\delta_{11}=4$ times, 2 is stored $\delta_{12}=2$ times; the seven locations of set 2 store 0 $\delta_{20}=2$ times and 3 $\delta_{23}=5$ times; etc. A summary of the memory locations is set out below:

| | Value of Random Variable | | | | | |
|---|---|---|---|---|---|---|
| | 0 | 1 | 2 | 3 | 4 | 5 |
| Frequency (set 1) | 3 | 4 | 2 | 0 | 0 | 0 |
| Frequency (set 2) | 2 | 0 | 0 | 5 | 0 | 0 |
| Frequency (set 3) | 7 | 9 | 4 | 1 | 6 | 0 |
| Frequency (set 4) | 7 | 6 | 8 | 2 | 4 | 3 |

Then to generate the random variables if

$0\leq u<.9$ put $y=a\{d_1\}$
$.9\leq u<.97$ $y=a\{d_1d_2-81\}$
$.97\leq u<.997$ $y=a\{d_1d_2d_3-954\}$
$.997\leq u<1.000$ $y=a\{d_1d_2d_3d_4-9927\}$

### 3. Generating a Continuous Random Variable

The method for generating deviates from a discrete distribution can be adapted to random variables having a continuous distribution. Let $F(y)$ be the cumulative distribution function and assume that the domain of the random variable is $(a,b)$ where the interval is finite. (If the domain is infinite, it must be truncated at (say) the points $a$ and $b$.) Divide the interval $(b-a)$ into $n$ sub-intervals of length $\Delta$ $(n\Delta=b-a)$ such that the boundary of the $i$th interval is $(y_{i-1}, y_i)$ where $y_i=a+i\Delta$ for $i=0, 1, \dots, n$. Now define a discrete distribution having domain

$$\left\{z_i=\frac{y_i+y_{i-1}}{2}\right\}$$

with point probabilities $p_i=F(y_i)-F(y_{i-1})$. Finally, let $W$ be a random variable having a uniform distribution on $\left(-\frac{\Delta}{2}, \frac{\Delta}{2}\right)$. This can be done by setting $W=\Delta\left(U-\frac{1}{2}\right)$. Then random deviates from the distribution function $F(y)$, can be generated (approximately) by setting $y=z+w=z+\Delta\left(u-\frac{1}{2}\right)$. This is simply an approximate decomposition of the continuous random variable into the sum of a discrete and continuous random variable. The discrete variable can be generated quickly by the method described previously. The smaller the value of $\Delta$ the better will be the approximation. Each number can be generated by using the leading digits of $U$ to generate the discrete random variable $Z$ and the remaining digits forming a uniformly distributed deviate having (0,1) domain.

### 4. Acceptance-Rejection Methods

In what follows the random variable $Y$ will be assumed to have finite domain $(a, b)$. If the domain is infinite, it must be truncated for computational purposes at (say) the points $a$ and $b$. Then the resulting random deviates will only have this truncated domain.

a) Let $f$ be the maximum of $f(y)$. Then the procedure for generating random deviates is: (1) generate a pair of uniform deviates $U_1$, $U_2$; (2) compute a point $y=a+(b-a)u_2$ in $(a, b)$; (3) if $u_1<f(y)/f$ accept $y$ as the random deviate, otherwise reject the pair $(u_1, u_2)$ and start again. The acceptance ratio of deviates actually produced is $[(b-a)f]^{-1}$. Hence the acceptance ratio decreases as the domain increases. One way to increase the acceptance ratio is to divide the interval $(a, b)$ into mutually exclusive sub-intervals and then carry out the acceptance-rejection process. For this purpose let the interval $(a, b)$ be divided into $k$ sub-intervals such that the end points of the $j$th interval are $(\xi_{j-1}, \xi_j)$ with $\xi_0=a$, $\xi_k=b$ and $\int_{\xi_{j-1}}^{\xi_j} f(y)dy=p_j$; further let the maximum of $f(y)$ in the $j$th interval be $f_j$. Then to generate random deviates from $f(y)$, generate $n$ pairs of deviates $(u_{1s}, u_{2s})s=1, 2, \ldots, n$. Assign $[np_j]$ such pairs to the $j$th interval and compute $y_j=\xi_{j-1}+(\xi_j-\xi_{j-1})u_{2s}$. If $u_{1s}<f(y_j)/f_j$ accept $y_j$ as a deviate. The acceptance ratio of this method is

$$\sum_{j=1}^{k} p_j[(\xi_j-\xi_{j-1})f_j]^{-1}$$

b) Let $F(y)$ be such that $f(y)=f_1(y)f_2(y)$ where the domain of $y$ is $(a, b)$. Let $f_1$ and $f_2$ be the maximum of $f_1(y)$ and $f_2(y)$ respectively. Then the procedure for generating random deviates having the probability density function $f(y)$ is: (1) generate $U_1$, $U_2$, $U_3$; (2) define $z=a+(b-a)u_3$; (3) if both $u_1<\frac{f_1(z)}{f_1}$ and $u_2<\frac{f_2(z)}{f_2}$, take $z$ as the random deviate; otherwise take another sample of three uniform deviates. The acceptance ratio of this method is $[(b-a)f_1f_2]^{-1}$ and can be increased by dividing $(a, b)$ into sub-intervals as in the previous case.

c) Let the probability density function of $Y$ be

$$f(y)=\int_\alpha^\beta g(y, t)dt,\ (\alpha\leq t\leq\beta),\ (a\leq y\leq b).$$

Let $g$ be the maximum of $g(y, t)$. Then the procedure for generating random deviates having the probability density function $f(y)$ is: (1) generate $U_1$, $U_2$, $U_3$; (2) define $s=\alpha+(\beta-\alpha)u_2$; $z=a+(b-a)u_3$; (3) if $u_1<\frac{g(z, s)}{g}$, take $z$ as the random deviate; otherwise take another sample of three. The acceptance ratio for this method is $[(b-a)g]^{-1}$ and can be increased by dividing the domain of $t$ and $y$ into sub-domains.

### 5. Composition Method

Let $g_z(y)$ be a probability density function which depends on the parameter $z$; further let $H(z)$ be the cumulative distribution function for $z$. In order to generate random deviates $Y$ having the frequency function

$$f(y)=\int_{-\infty}^{\infty} g_z(y)dH(z)$$

one draws a deviate having the cumulative distribution function $H(z)$; then draws a second sample having the probability density function $g_z(y)$.

### 6. Generation of Random Deviates From Well Known Distributions

#### a. Normal distribution

(1) *Inverse method:* The inverse method depends on having a convenient approximation to the inverse function $x=P^{-1}(u)$ where

$$u=(2\pi)^{-1/2}\int_{-\infty}^{x} e^{-t^2/2}dt.$$

Two ways of performing this operation are to (i) use **26.2.23** with $t=\left(\ln\frac{1}{u^2}\right)^{1/2}$ or (ii) approximate $x=P^{-1}(u)$ piecewise using Chebyshev polynomials, see [26.54].

(2) *Sum of uniform deviates:* Let $U_1$, $U_2$, . . ., $U_n$ be a sequence of $n$ uniform deviates. Then

$$X_n=\left(\sum_{i=1}^{n} U_i-\frac{n}{2}\right)\left(\frac{n}{12}\right)^{-1/2}$$

will be distributed asymptotically as a normal random deviate. When $n=12$, the maximum errors made in the normal deviate are $9\times10^{-3}$ for $|X|<2$, $9\times10^{-1}$ for $2<|X|<3$. An improvement can be made by taking a polynomial function of $X_n$ (say)

$$X_n^*=X_n \sum_{s=0}^{k} a_{2s}X_n^{2s}$$

as the normal deviate where $a_{2s}$ are suitable coefficients. These coefficients may be calculated using (say) Chebyshev polynomials or simply by making the asymptotic random deviate agree with the correct normal deviate at certain specified points. When $n=12$, the maximum error in the normal deviate is $8\times10^{-4}$ using the coefficients

* $a_0=9.8746$ * $a_6=(-7)-5.102$
* $a_2=(-3)3.9439$ * $a_8=(-7)1.141$
* $a_4=(-5)7.474$

(3) *Direct method:* Generate a pair of uniform deviates $(U_1, U_2)$. Then

$$X_1=(-2 \ln U_1)^{1/2} \cos 2\pi U_2,$$

$X_2=(-2 \ln U_1)^{1/2} \sin 2\pi U_2$ will be a pair of independent normal random deviates with mean zero and unit variance. This procedure can be modified by calculating $\cos 2\pi U$ and $\sin 2\pi U$ using an acceptance rejection method; e.g., (1) generate $(U_1, U_2)$; (2) if $(2U_1-1)^2+(2U_2-1)^2\leq1$ generate a third uniform deviate $U_3$, otherwise reject the pair and start over; (3) calculate $y_1=(-\ln u_3)^{1/2}\dfrac{u_1^2-u_2^2}{u_1^2+u_2^2}$, $y_2=\pm2(-\ln u_3)^{1/2}\dfrac{u_1u_2}{u_1^2+u_2^2}$ ($\pm$ random). Both $y_1$ and $y_2$ are the desired random deviates.

(4) *Acceptance-rejection method:* 1) Generate a pair of uniform deviates $(U_1, U_2)$; 2) compute
* $x=-\ln u_1$; 3) if $e^{-\frac{1}{2}(x-1)^2}\geq u_2$ (or equivalently $(x-1)^2\leq-2(\ln u_2)$ accept $x$, otherwise reject the pair and start over. The quantity will be the required normal deviate with mean zero and unit variance.

**b. Bivariate normal distribution**

Let $\{X_1, X_2\}$ be a pair of independent normal deviates with mean zero and unit variance. Then $\{X_1, \rho X_1+(1-\rho^2)^{1/2}X_2\}$ represent a pair of deviates from a bivariate normal distribution with zero means, unit variances, and correlation coefficient $\rho$.

**c. Exponential distribution**

(1) *Inverse method:* Since $F(x)=e^{-x/\theta}$, $X=-\theta \ln U$ will be a deviate from the exponential distribution with parameter $\theta$.

(2) *Acceptance-rejection method:* 1) Generate a pair of independent uniform deviates $(U_0, U_1)$; 2) if $U_1<U_0$ generate a third value $U_2$; 3) if $U_1+U_2<U_0$ generate a fourth value $U_3$, etc.; 4) continue generating uniform deviates until an $n$ is obtained such that $U_1+U_2+\ldots+U_{n-1}<U_0<U_1+\ldots+U_n$; 5) if $n$ is even reject the procedure and start a fresh trial with a new value of $U_0$, otherwise if $n$ is odd take $X=\theta U_0$ as the desired deviate; 6) in general if $t$ is the number of trials until an acceptable sequence is obtained $X=\theta(t+U_0)$. The random deviates produced in this way follow an exponential distribution with parameter $\theta$. One can expect to generate approximately six uniform deviates for every exponential deviate.

(3) *Discrete Distribution Method:* Let $Y$ and $n$ be discrete random variables with point probabilities

* $Pr\{Y=r\}=(e-1)e^{-(r+1)}$ $r=0, 1, 2, \ldots$
$Pr\{n=s\}=[s!(e-1)]^{-1}$ $s=1, 2, 3, \ldots.$

Then $X=Y+\min(U_1, U_2, \ldots, U_n)$ will follow an exponential distribution. The average value of $n$ is 1.58 so that one needs, on the average, only 1.58 $u$'s from which the minimum is selected.

## 26.9. Use and Extension of the Tables

### Use of Probability Function Inequalities

**Example 1.** Let $X$ be a random variable with finite mean and variance equal to $m$ and $\sigma^2$, respectively. Use the inequalities for probability functions **26.1.37, 40, 41** to place lower bounds on

$$A(t)=F(t)-F(-t)=P\left\{\frac{|X-m|}{\sigma}\leq t\right\}$$

for $t=1(1)4$.

Lower bounds on $A(t)=F(t)-F(-t)$

| $t=1$ | 2 | 3 | 4 | *Remarks* |
|---|---|---|---|---|
| 0 | .7500 | .8889 | .9375 | no knowledge of $F(t)$; **26.1.37** |
| .5556 | .8889 | .9506 | .9722 | $F(t)$ is unimodal and continuous; **26.1.40** |
| 0 | .8182 | .9697 | .9912 | $F(t)$ is such that $\mu_4=3$; **26.1.41** |

---

*See page II.

It is of interest to note that the standard normal distribution is unimodal, has mean zero, unit variance $\mu_4=3$, is continuous, and such that

$$A(t)=P(t)-P(-t)$$
$$=.6827,\ .9545,\ .9973,\ \text{and}\ .9999$$

for $t=1$, 2, 3 and 4 respectively.

### Interpolation for $P(x)$ in Table 26.1

**Example 2.** Compute $P(x)$ for $x=2.576$ to fifteen decimal places using a Taylor expansion.

Writing $x=x_0+\theta$ we have

$$P(x)=P(x_0)+Z(x_0)\theta+Z^{(1)}(x_0)\frac{\theta^2}{2!}$$
$$+Z^{(2)}(x_0)\frac{\theta^3}{3!}+Z^{(3)}(x_0)\frac{\theta^4}{4!}+\ldots$$

Taking $x_0=2.58$ and $\theta=-4\times10^{-3}$ we calculate the successive terms to 16D

$$\begin{array}{lrrrr}
+ & .99505 & 99842 & 42230 & \\
- & 5 & 72204 & 35976 & 6 \\
- & & 2952 & 57449 & 6 \\
- & & 8 & 63097 & 8 \\
- & & & 1439 & 4 \\
- & & & & 9 \\
\hline
 & .99500 & 24676 & 84265 & 7
\end{array}$$

The result correct to 17D is

$$P(2.576)=.99500\ 24676\ 84264\ 98$$

### Calculation for Arbitrary Mean and Variance

**Example 3.** Find the value to 5D of

$$P\{X\leq .50\}=\frac{1}{2\sqrt{2\pi}}\int_{-\infty}^{.5}e^{-1/2\left(\frac{t-1}{2}\right)^2}dt$$

using **26.2.8** and **Table 26.1.**

This represents the probability of the random variable being less than or equal to .5 for a normal distribution with mean $m=1$ and variance $\sigma^2=4$. Using **26.2.8** we have

$$P\{X\leq .5\}=P\left(\frac{.5-1}{2}\right)=P(-.25)$$

Since $P(-x)=1-P(x)$, we have

$$P(-.25)=1-P(.25)=1-.59871=.40129$$

where a two-term Taylor series was used for interpolation. Note that when interpolating for $P(x)$ for a value of $x$ midway between the tabulated values we can write $x=x_0+.01$ and a two-term Taylor series is $P(x)=P(x_0)+Z(x_0)10^{-2}$. Thus one need only multiply $Z(x_0)$ by $10^{-2}$ and add the result to $P(x_0)$.

### Calculation of $P(x)$ for $x$ Approximate

**Example 4.** Using **Table 26.1,** find $P(x)$ for $x=1.96$, when there is a possible error in $x$ of $\pm5\times10^{-3}$.

This is an example where the argument is only known approximately. The question arises as to how many decimal places one should retain in $P(x)$. If $\Delta x$ and $\Delta P(x)$ denote the error in $x$ and the resulting error in $P(x)$, respectively, then

$$\Delta P(x)\approx Z(x)\Delta x$$

Hence $\Delta P(1.960)=3\times10^{-4}$ which indicates that $P(1.960)$ need only be calculated to 4D. Therefore $P(1.960)=.9750$.

### Inverse Interpolation for $P(x)$

**Example 5.** Find the value of $x$ for which $P(x)=.97500\ 00000\ 00000$ using **Table 26.1** and determining as many decimal places as is consistent with the tabulated function.

For inverse interpolation the tabulated function $P(x)$ may be regarded as having a possible error of $.5\times10^{-15}$. Hence

$$\Delta x\approx\frac{\Delta P(x)}{Z(x)}=\frac{.5\times10^{-15}}{Z(x)}$$

Let $P(x_0)$ correspond to the closest tabulated value of $P(x)$. Then a convenient formula for inverse interpolation is

$$x=x_0+t+\frac{x_0t^2}{2}+\frac{2x_0^2+1}{6}\,t^3$$

where

$$t=\frac{P(x)-P(x_0)}{Z(x_0)}$$

If only the first two terms (i.e., $x=x_0+t$) are used, the error in $x$ will be bounded by $\frac{x}{8}\times10^{-4}$ and the true value will always be greater than the value thus calculated.

With respect to this example, $\Delta x\approx10^{-14}$ and thus the interpolated value of $x$ may be in error by one unit in the fourteenth place. The closest value to $P(x)=.97500\ 00000\ 00000$ is $P(x_0)=.97500\ 21048\ 51780$ with $x_0=1.96$. Hence using the preceding inverse interpolation formulas with

$$t=-.00003\ 60167\ 31129$$

and carrying fifteen decimals we have the successive terms

$$\begin{array}{lrrr}
+ & 1.96000 & 00000 & 00000 \\
- & .00003 & 60167 & 31129 \\
+ & & 12 & 71261 \\
- & & & 68 \\
 & & & 0 \\
\hline
+ & 1.95996 & 39845 & 40064
\end{array}$$

### Edgeworth Asymptotic Expansion

**Example 6.** Find the Edgeworth asymptotic expansion **26.2.49** for the c.d.f. of chi-square.

*Method 1.* Expansion for $\chi^2$

Let

$$Q(\chi^2|\nu)=1-F(t)$$

where

$$t=\frac{\chi^2-\nu}{(2\nu)^{\frac{1}{2}}}$$

Since the values of $\gamma_1$ and $\gamma_2$ **26.4.33** are

$$\gamma_1=2\sqrt{2}/\nu^{\frac{1}{2}}$$

$$\gamma_2=12/\nu,$$

we obtain, by using the first two bracketed terms of **26.2.49**

$$F(t)\sim P(t)-\frac{1}{\nu^{\frac{1}{2}}}\left[\frac{\sqrt{2}}{3}Z^{(2)}(t)\right]$$
$$+\frac{1}{\nu}\left[\frac{1}{2}Z^{(3)}(t)+\frac{1}{9}Z^{(5)}(t)\right]$$

The Edgeworth expansion is an asymptotic expansion in terms of derivatives of the normal distribution function. It is often possible to transform a random variable so that the distribution of the transformed random variable more closely approximates the normal distribution function than does the distribution of the original random variable. Hence for the same number of terms, greater accuracy may be achieved by using the transformed variable in the expansion. Since the distribution of $\sqrt{2\chi^2}$ is more closely approximated by a normal distribution than $\chi^2$ itself (as judged by a comparison of the values of $\gamma_1$ and $\gamma_2$), we would expect that the Edgeworth asymptotic expansion of $\sqrt{2\chi^2}$ would be superior to that of $\chi^2$.

*Method 2.* Expansion for $\sqrt{2\chi^2}$. Let

$$Q(\chi^2|\nu)=1-F(t)=1-F\left(\frac{\sqrt{2\chi^2}-(2\nu-1)^{\frac{1}{2}}}{\left(1-\frac{1}{4\nu}\right)^{\frac{1}{2}}}\right)$$

where $(2\nu-1)^{\frac{1}{2}}$ and $1-\frac{1}{4\nu}$ are the mean and variance to terms of order $\nu^{-2}$ of $\sqrt{2\chi^2}$ (see **26.4.34**). The values of $\gamma_1$ and $\gamma_2$ for $\sqrt{2\chi^2}$ are

$$\gamma_1\approx\frac{1}{\sqrt{2\nu}}\left[1+\frac{5}{8\nu}\right]\qquad\gamma_2\approx\frac{3}{4\nu^2}$$

Thus we obtain

$$F(t)\sim P(t)-\frac{1}{\nu^{\frac{1}{2}}}\left[\frac{\sqrt{2}}{12}\left(1+\frac{5}{8\nu}\right)Z^{(2)}(t)\right]$$
$$+\frac{1}{\nu}\left[\frac{1}{32\nu}Z^{(3)}(t)+\frac{1}{144}\left(1+\frac{5}{8\nu}\right)^2Z^{(5)}(t)\right]$$

For numerical examples using these expansions see **Example 12.**

### Calculation of $L(h, k, \rho)$

**Example 7.** Find $L(.5, .4, .8)$. Using **26.3.20**

$$\sqrt{h^2-2\rho hk+k^2}=\sqrt{.09}=.3$$

$$L(.5,.4,.8)=L(.5,0,0)+L(.4,0,-.6)$$

Reference to **Figure 26.2** yields

$$L(.5,0,0)+L(.4,0,-.6)=.16+.08=.24$$

The answer to 3D is $L(.5, .4, .8)=.250$.

### Calculation of the Bivariate Normal Probability Function

**Example 8.** Let $X$ and $Y$ follow a bivariate normal distribution with parameters $m_x=3$, $m_y=2$, $\sigma_x=4$, $\sigma_y=2$, and $\rho=-.125$. Find the value of $P_r\{X\geq 2,\ Y\geq 4\}$ using **26.3.20** and **Figures 26.2, 26.3.**

Since $P_r\{X\geq h, Y\geq k\}=L\left(\frac{h-m_x}{\sigma_x},\frac{k-m_y}{\sigma_y},\rho\right)$ we have $P\{X\geq 2,\ Y\geq 4\}=L(-.25,1,-.125)$. Using **26.3.20**

$$L(-.25,1,-.125)=L(-.25,0,.969)$$
$$+L(1,0,.125)-\frac{1}{2}$$

**Figure 26.2** only gives values for $h>0$, however, using the relationship **26.3.8** with $k=0$, $L(-h,0,\rho)$ $=\frac{1}{2}-L(h,0,-\rho)$ and thus $L(-.25,0,.969)$ $=\frac{1}{2}-L(.25,0,-.969)$. Therefore $L(-.25,1,-.125)$ $=-L(.25,0,-.969)+L(1,0,.125)=-.01+.09=.08$.

The answer to 3D is $L(-.25,\ 1.,\ -.125)=.080$.

### Integral of a Bivariate Normal Distribution Over a Polygon

**Example 9.** Let the random variables $X$ and $Y$ have a bivariate normal distribution with parameters $m_x=5$, $\sigma_x=2$, $m_y=9$, $\sigma_y=4$, and $\rho=.5$. Find the probability that the point $(X, Y)$ be inside the triangle whose vertices are $A=(7,8)$, $B=(9,13)$, and $C=(2,9)$.

When obtaining the integral of a bivariate normal distribution over a polygon, it is first necessary to use **26.3.22** in order to transform the variates so that one deals with a circular normal distribution. The polygon in the region of the transformed variables is then divided into configurations such that the integral over any selected configuration can be easily obtained. Below are listed some of the most useful configurations.

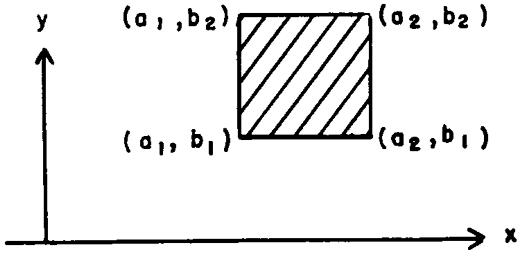

FIGURE 26.5

$$\int_{a_1}^{a_2}\int_{b_1}^{b_2} g(x,y,0)dxdy=[P(a_2)-P(a_1)][P(b_2)-P(b_1)]$$

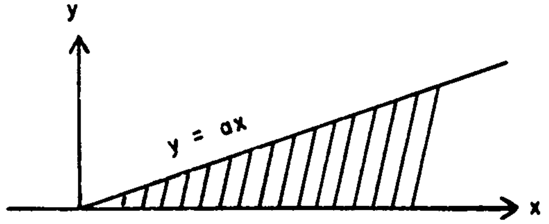

FIGURE 26.6

$$\int_0^\infty\int_0^{ax} g(x,y,0)dxdy=\frac{\arctan a}{2\pi}$$

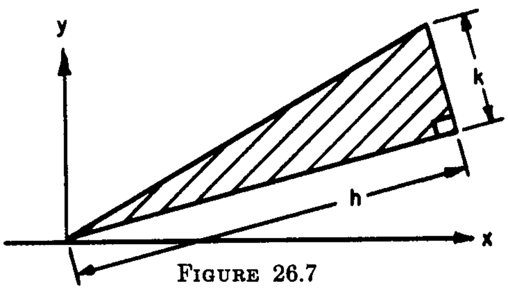

FIGURE 26.7

$$\int_0^h\int_0^{\frac{k}{h}x} g(x,y,0)dxdy=V(h,k)^{11}$$

For the following two configurations we define

$$h=\frac{|t_2s_1-t_1s_2|}{[(s_2-s_1)^2+(t_2-t_1)^2]^{\frac{1}{2}}}$$

$$k_1=\frac{|s_1(s_2-s_1)+t_1(t_2-t_1)|}{[(s_2-s_1)^2+(t_2-t_1)^2]^{\frac{1}{2}}}$$

$$k_2=\frac{|s_2(s_2-s_1)+t_2(t_2-t_1)|}{[(s_2-s_1)^2+(t_2-t_1)^2]^{\frac{1}{2}}}$$

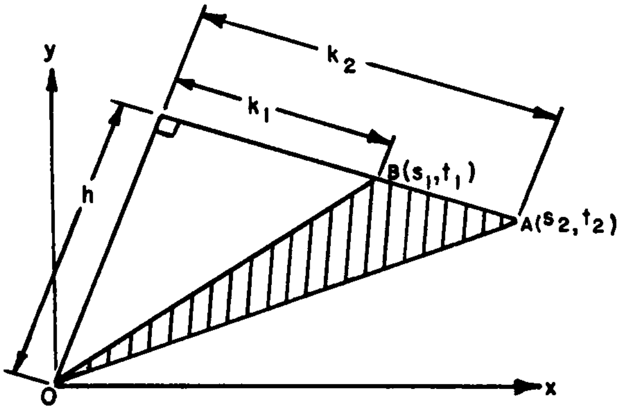

FIGURE 26.8

$$\iint_{\Delta AOB} g(x,y,0)dxdy=V(h,k_2)-V(h,k_1)$$

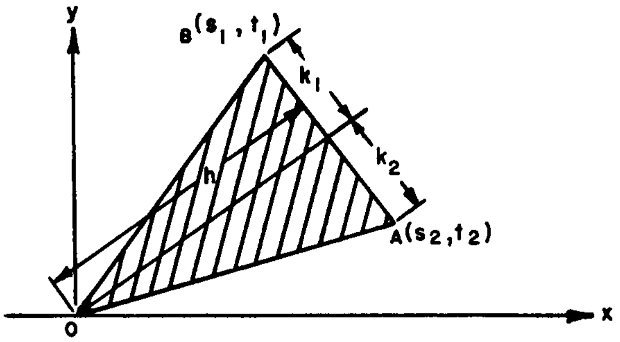

FIGURE 26.9

$$\iint_{\Delta AOB} g(x,y,0)dxdy=V(h,k_2)+V(h,k_1)$$

Using the circularizing transformation **26.3.22** for our example results in

$$s=\frac{1}{\sqrt{3}}\left(\frac{x-5}{2}+\frac{y-9}{4}\right)$$

$$t=-\frac{1}{1}\left(\frac{x-5}{2}-\frac{y-9}{4}\right)$$

---

[11] See **26.3.23** for definition of $V(h, k)$.

The vertices of the triangle in the $(s, t)$ coordinates become $A=(\sqrt{3}/4,\ -5/4)$, $B=(\sqrt{3},\ -1)$ and $C=\left(-\frac{\sqrt{3}}{2}, \frac{3}{2}\right)$. These points are plotted below. From the figure it is seen that the desired probability is the sum of the probabilities that the point having the transformed variables as coordinates is inside the triangles *AOB*, *AOC*, and *BOC*.

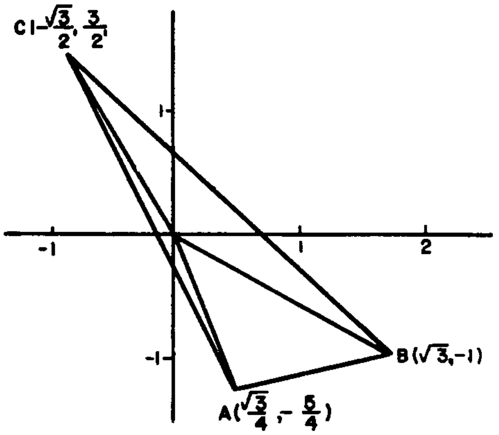

FIGURE 26.10

For these three triangles we have

| | $h$ | $k_1$ | $k_2$ |
|---|---|---|---|
| $\Delta AOB$ | $\frac{2}{7}\sqrt{21}$ | $\sqrt{7}/14$ | $\frac{4}{7}\sqrt{7}$ |
| $\Delta AOC$ | $\frac{1}{74}\sqrt{111}$ | $\frac{8}{37}\sqrt{37}$ | $\frac{21}{74}\sqrt{37}$ |
| $\Delta BOC$ | $\frac{1}{13}\sqrt{39}$ | $\frac{7}{13}\sqrt{13}$ | $\frac{6}{13}\sqrt{13}$ |

From the graph it is seen that the probability over *AOB* may be found in the same manner as that over **Figure 26.8**, and over *AOC* and *BOC* the probabilities may be found as that over **Figure 26.9.**

Hence

$$\iint_{\Delta} g(x, y, .5)dxdy = \iint_{\Delta ABC} g(s, t, 0)dsdt$$

$$= \iint_{\Delta AOB} g(s, t, 0)dsdt + \iint_{\Delta AOC} g(s, t, 0)dsdt$$

$$+ \iint_{\Delta BOC} g(s, t, 0)dsdt$$

and consequently using **26.3.23** and **Figure 26.2**

$$\iint_{\Delta AOB} g(s, t, 0)dsdt = V\left(\frac{2}{7}\sqrt{21}, \frac{4\sqrt{7}}{7}\right) - V\left(\frac{2}{7}\sqrt{21}, \frac{\sqrt{7}}{14}\right)$$

$$= \left[\frac{1}{4} + L(1.31, 0, -.76) - L(0, 0, -.76) - \frac{1}{2}Q(1.31)\right]$$

$$-\left[\frac{1}{4} + L(1.31, 0, -.14) - L(0, 0, -.14) - \frac{1}{2}Q(1.31)\right]$$

$$= L(1.31, 0, -.76) - L(0, 0, -.76)$$

$$-L(1.31, 0, -.14) + L(0, 0, -.14)$$

$$= .00 - .11 - .04 + .23 = .08$$

$$\iint_{\Delta AOC} g(s, t, 0)dsdt = V\left(\frac{\sqrt{111}}{74}, \frac{8\sqrt{37}}{37}\right) + V\left(\frac{\sqrt{111}}{74}, \frac{21\sqrt{37}}{74}\right)$$

$$= \left[\frac{1}{4} + L(.14, 0, -.99) - L(0, 0, -.99) - \frac{1}{2}Q(.14)\right]$$

$$+\left[\frac{1}{4} + L(.14, 0, -1) - L(0, 0, -1) - \frac{1}{2}Q(.14)\right]$$

$$= .01 + .02 = .03$$

$$\iint_{\Delta BOC} g(s, t, 0)dsdt = V\left(\frac{\sqrt{39}}{13}, \frac{7\sqrt{13}}{13}\right) + V\left(\frac{\sqrt{39}}{13}, \frac{6\sqrt{13}}{13}\right)$$

$$= \left[\frac{1}{4} + L(.48, 0, -.97) - L(0, 0, -.97) - \frac{1}{2}Q(.48)\right]$$

$$+\left[\frac{1}{4} + L(.48, 0, -.96) - L(0, 0, -.96) - \frac{1}{2}Q(.48)\right]$$

$$= .05 + .04 = .09$$

Thus adding all parts, the probability that $X$ and $Y$ are in triangle $ABC$ is $= .08 + .03 + .09 = .20$. The answer to 3D is .211.

### Calculation of a Circular Normal Distribution Over an Offset Circle

**Example 10.** Let $X$ and $Y$ have a circular normal distribution with $\sigma=1000$. Find the probability that the point $(X, Y)$ falls within a circle having a radius equal to 540 whose center is displaced 1210 from the mean of the circular normal distribution.

In units of $\sigma$, the radius and displacement from the center are, respectively, $R=\frac{540}{1000}=.54$ and $r=\frac{1210}{1000}=1.21$. The problem is thus reduced to finding the probability of $X$ and $Y$ falling in a circle of radius $R=.54$ displaced $r=1.21$ from the center of the distribution where $\sigma=1$.

Since $R<1$, the approximation **26.3.25** is used. This results in

$$P(R^2|2,r^2)=\frac{2(.54)^2}{4+(.54)^2}\exp\frac{-2(1.21)^2}{4+(.54)^2}$$

$$=(.1359)e^{-.6823}=.06869$$

The answer to 5D is .06870.

### Interpolation for $Q(\chi^2|\nu)$

**Example 11.** Find $Q(25.298|20)$ using the interpolation formula given with **Table 26.7.**

Taking $\chi^2=25$, $\theta=.298$ and applying the interpolation formula results in

$$\begin{aligned}Q(25.298|20)&=\frac{1}{8}\{Q(25|16)\theta^2+Q(25|18)(4\theta-2\theta^2)\\&\qquad+Q(25|20)(8-4\theta+\theta^2)\}\\&=\frac{1}{8}\{(.06982)(.088804)\\&\qquad+(.12492)(1.014392)\\&\qquad+(.20143)(6.896804)\}\\&=.19027\end{aligned}$$

A less accurate interpolate may be obtained by setting $\theta^2$ equal to zero in the above formula. This results in the value .19003. The correct value to 6D is $Q(25.298|20)=.190259$.

On the other hand if $\chi^2=25.298$ is assumed to have an error of $\pm5\times10^{-4}$, then how large an error arises in $Q(\chi^2|\nu)$? Denoting the error in $\chi^2$ by $\Delta\chi^2$ and the resulting error in $Q(\chi^2|\nu)$ by $\Delta Q(\chi^2|\nu)$, we then have the approximate relationship

$$\Delta Q(\chi^2|\nu)\approx\frac{\partial Q(\chi^2|\nu)}{\partial\chi^2}\Delta\chi^2$$

Using **26.4.8** we can write

$$\frac{\partial Q(\chi^2|\nu)}{\partial\chi^2}=\frac{1}{2}[Q(\chi^2|\nu-2)-Q(\chi^2|\nu)]$$

and

$$\Delta Q(\chi^2|\nu)\approx\frac{1}{2}[Q(\chi^2|\nu-2)-Q(\chi^2|\nu)]\Delta\chi^2$$

For practical purposes it is sufficient to evaluate the derivative to one or two significant figures. Consequently we can write

$$\frac{\partial Q(\chi^2|\nu)}{\partial\chi^2}\approx\frac{\partial Q(\chi_0^2|\nu)}{\partial\chi^2}$$

where $\chi_0^2$ is the closest value to $\chi^2$ for which $Q$ is tabulated. Hence

$$\Delta Q(\chi^2|\nu)\approx\frac{1}{2}[Q(\chi_0^2|\nu-2)-Q(\chi_0^2|\nu)]\Delta\chi^2$$

For this example $\Delta\chi^2=\pm5\times10^{-4}$ and $\chi_0^2=25$. This results in

$$\Delta Q(\chi^2|\nu)=\frac{1}{2}(-.076)(\pm5)10^{-4}=\pm2\times10^{-5}$$

as the possible error in $Q(\chi^2|\nu)$.

### Calculation of $Q(\chi^2|\nu)$ Outside the Range of Table 26.7

**Example 12.** Find the value of $Q(84|72)$.

Since this value is outside the range of **Table 26.7** we can approximate $Q(84|72)$ by (1) using the Edgeworth expansion for $Q(\chi^2|\nu)$ given in **Example 6,** (2) the cube root approximation **26.4.14,** (3) the improved cube root approximation **26.4.15** or (4) the square root approximation **26.4.13.** The results of using all four methods are presented below:

#### 1. Edgeworth expansion

The successive terms of the Edgeworth expansion for the distribution of chi-square result in

$$\begin{aligned}1-Q(84|72)=&.841345\\&.000000\\&.001120\\\hline&.842465\end{aligned}$$

Hence $Q(84|72)=.15754$.

The successive terms of the Edgeworth expansion for the distribution of $\sqrt{2\chi^2}$ result in

$$\begin{aligned}1-Q(84|72)=&.842544\\&-.000034\\&-.000138\\\hline&.842372\end{aligned}$$

Hence $Q(84|72)=.15764$.

#### 2. Cube root approximation 26.4.14

Using the cube root approximation we have

$$Q(84|72)=Q(x)$$

where

$$x=\frac{\left(\frac{84}{72}\right)^{1/3}\left[1-\frac{2}{9(72)}\right]}{\left[\frac{2}{9(72)}\right]^{\frac{1}{2}}}=1.0046$$

This results in $Q(84|72)=Q(1.0046)=1-P(1.0046)=.15754$.

#### 3. Improved cube root approximation 26.4.15

The improved cube root approximation involves calculating a correction factor $h_\nu$ to $x$. Linearly interpolating for $h_{60}$ (which appears below **26.4.15**) with $x=1.0046$ results in $h_{60}=-.0006$ and hence

$$h_{72}=\frac{60}{72}(-.0006)=-.00049$$

Thus

$$Q(84|72)=Q(1.0046-.0005)=Q(1.0041)$$

$$=1-P(1.0041)=.15766$$

**4. Square root approximation 26.4.13**

Using the square root approximation we have $Q(84|72)=Q(x)$ where

$$x=\sqrt{2(84)}-\sqrt{2(72)-1}=1.0032.$$

This results in

$$Q(84|72)=Q(1.0032)=1-P(1.0032)=.15788$$

The value correct to 6D is $Q(84|72)=.157653$. Generally the improved cube root approximation will be correct with a maximum error of a few units in the fifth decimal and is recommended for calculations which are outside the range of **Table 26.7.**

### Calculation of $\chi^2$ for $Q(\chi^2|\nu)$ Outside the Range of Table 26.8

**Example 13.** Find the value of $\chi^2$ for which $Q(\chi^2|144)=.01$.

Since $\nu=144$ is outside the range of **Table 26.8,** we can compute it by using (1) the Cornish-Fisher asymptotic expansion **26.2.50,** for $\chi^2$, (2) the cube approximation **26.4.17,** (3) the improved cube approximation **26.4.18,** or (4) the square approximation **26.4.16.** We shall compute the value by all four methods.

**1. Cornish-Fisher asymptotic expansion 26.2.50**

The Cornish-Fisher asymptotic expansion for $\chi^2$ with $\nu=144$ can be written as

$$\chi^2\sim 144+12\sqrt{2}x+4h_1(x)+\frac{4\sqrt{2}}{12}[3h_2(x)+2h_{11}(x)]$$

$$+\frac{8}{12^2}[6h_3(x)+3h_{12}(x)+2h_{111}(x)]+\frac{16\sqrt{2}}{12^3}[30h_4(x)$$

$$+9h_{22}(x)+12h_{13}(x)+6h_{112}(x)+4h_{1111}(x)]$$

Hence using the auxiliary table following **26.2.51** with $p=.01$ we have

$$\begin{array}{r} 144.0000 \\ 39.4794 \\ 2.9413 \\ -.0242 \\ -.0019 \\ +.0002 \\ \hline \chi^2=186.395 \end{array}$$

**2. Cube approximation 26.4.17**

Taking $\chi_{.01}=2.32635$ we have

$$\chi^2=144\left\{\left[1-\frac{2}{9(144)}\right]+(2.32635)\sqrt{\frac{2}{9(144)}}\right\}^3=186.405$$

**3. Improved cube approximation 26.4.18**

From the table for $h_{60}$ we obtain using linear interpolation with $x=2.33$ (approximately)

$$h_{60}=.0012 \text{ and thus } h_{144}=\frac{60}{144}(.0012)=.00049$$

Hence

$$\chi^2=144\left[1-\frac{2}{9(144)}+(2.32635-.00049)\sqrt{\frac{2}{9(144)}}\right]^3=186.394$$

**4. Square approximation 26.4.16**

$$\chi^2=\frac{1}{2}[2.32635+\sqrt{2(144)-1}]^2=185.616$$

The correct answer to 3D is $\chi^2=186.394$. Generally the improved cube approximation will give results correct in the second or third decimal for $\nu>30$.

### Calculation of the Incomplete Gamma Function

**Example 14.** Find the value of

$$\gamma(2.5,.9)=\int_0^{.9}t^{1.5}e^{-t}dt$$

making use of **26.4.19** and **Table 26.7.**

Using **26.4.19** we have

$$\gamma(2.5,.9)=\Gamma(2.5)P(1.8|5)=\Gamma(2.5)[1-Q(1.8|5)]$$

$$\gamma(2.5,.9)=\frac{3}{4}\sqrt{\pi}[1-.87607]=.16475$$

### Poisson Distribution

**Example 15.** Find the value of $m$ for which

$$\sum_{i=0}^{3}e^{-m}\frac{m^i}{i!}=.99$$

using **26.4.21** and **Table 26.8.**

From **Table 26.8** with $\nu=2c=8$ and $Q=.99$ we have $\chi^2=1.646482$. Hence $m=\chi^2/2=.823241$.

### Inverse of the Incomplete Beta Function

**Example 16.** Find the value of $x$ for which $I_x(10,\ 6)=.10$ using **Table 26.9** and **26.5.28.** *
Using **26.5.28** we have

---

*See page II.

$$I_x(10,6)=Q(F|12,20)=.10 \text{ where } x=\frac{20}{20+12F}$$

From **Table 26.9** the upper 10 percent point of $F$ with 12 and 20 degrees of freedom is $F=1.89$. Hence

$$x=\frac{20}{20+12(1.89)}=.469$$

The correct value to 4D is $x=.4683$.

#### Calculation of $I_x(a, b)$ for $a$ or $b$ Small Integers

**Example 17.** Calculate $I_{.10}(3, 20)$.

Values of $I_x(a, b)$ for small integral $a$ or $b$ can conveniently be calculated using **26.5.6** or **26.5.7.** Using **26.5.6** we have

$$1-I_{.90}(20,3)=\frac{(.9)^{20}}{B(3,20)}\left\{\sum_{i=0}^{2}(-1)^i\binom{2}{i}\frac{.9^i}{20+i}\right\}$$

$$=\frac{.121576}{.216450\times10^{-3}}(.110390\times10^{-2})=.620040$$

#### Binomial Distribution

**Example 18.** Find the value of $p$ which satisfies

$$\sum_{s=0}^{20}\binom{50}{s}p^sq^{50-s}=.95, \qquad q=1-p$$

using **26.5.24** and **Table 26.9.**

[*] Combining **26.5.24** and **26.5.28** we have

$$\sum_{s=a}^{n}\binom{n}{s}p^sq^{n-s}=Q(F|\nu_1, \nu_2)$$

where

$$\nu_1=2(n-a+1), \nu_2=2(a), \text{ and } p=\frac{a}{a+(n-a+1)F}$$

Hence

$$\sum_{s=0}^{20}\binom{50}{s}p^sq^{50-s}=1-\sum_{s=21}^{50}\binom{50}{s}p^sq^{50-s}$$

$$=1-Q(F|60,42)=.95$$

Harmonic interpolation on $\nu_2$ in the table for which $Q(F|\nu_1, \nu_2)=.05$ results in $F=1.624$ for $\nu_1=60$, $\nu_2=42$, and thus $p=\frac{42}{42+60(1.624)}=.301$. The correct answer to 4D is $p=.3003$.

#### Approximating the Incomplete Beta Function

**Example 19.** Find $I_{.60}(16, 10.5)$ using **26.5.21.**

Values of $I_x(a, b)$ can conveniently be calculated with good accuracy using the approximation given by **26.5.20** or **26.5.21.** For this example $(a+b-1)(1-x)=10.20$ which is greater than .8 and hence **26.5.21** will be used. Thus

$$w_1=[(10.5)(.60)]^{1/3}=1.8469, w_2=[16(.4)]^{1/3}=1.8566$$

$$y=\frac{3[(1.8469)(.98942)-(1.8566)(.99306)]}{\left[\frac{(1.8469)^2}{10.5}+\frac{(1.8566)^2}{16}\right]^{\frac{1}{2}}}=-.0668$$

and interpolating in **Table 26.1** gives

$$P(-.0668)=1-P(.0668)=.47336$$

The answer correct to 5D is $I_{.60}(16, 10.5)=.47332$.

#### Interpolation for $F$ in Table 26.9

**Example 20.** Find the value of $F$ for which

$Q(F|7, 20)=.05$ using **Table 26.9.**

Interpolation in **Table 26.9** is approximately linear when the reciprocals of the degrees of freedom $(\nu_1, \nu_2)$ are used as the interpolating variable. For this example it is only necessary to interpolate with respect to $1/\nu_1$. Thus linear interpolation on $1/\nu_1$ results in $F=2.51$ which is the correct interpolate.

#### Calculation of $F$ for $Q(F|\nu_1,\nu_2)>.50$

**Example 21.** Find the value of $F$ for which $Q(F|4, 8)=.90$ using **26.6.9** and **Table 26.9.**

**Table 26.9** only tabulates values of $F$ for which $Q(F|\nu_1, \nu_2)=p$ where $p=.500$, .250, .100, .050, .025, .010, .005, .001. However making, use of **Table 26.9** we can find the values of $F_p$ for which $p=.75$, .9, .95, .975, .99, .995, .999. For this example we have

$$F_{.90}(4,8)=\frac{1}{F_{.10}(8,4)}$$

and referring to the table for which $Q(F|\nu_1, \nu_2)=.10$ gives $F_{.10}(8, 4)=3.95$ and thus $F_{.90}(4, 8)=\frac{1}{3.95}$ $=.253$.

#### Calculation of $Q(F|\nu_1,\nu_2)$ for Small Integral $\nu_1$ or $\nu_2$

**Example 22.** Compute $Q(2.5|4, 15)$ using **26.6.4.**

Values of $Q(F|\nu_1, \nu_2)$ can be readily computed for small $\nu_1$ or $\nu_2$ using the expansions **26.6.4** to **26.6.8** inclusive. We have using **26.6.4**

$$x=\frac{15}{15+4(2.50)}=.60$$

and

$$Q(2.50|4,15)=(.6)^{7.5}\left[1+\frac{15}{2}(.4)\right]=.086\,735$$

---

[*] See page II.

### Approximating $Q(F|\nu_1,\nu_2)$

**Example 23.** Calculate $Q(1.714|10,40)$ using **26.6.15.**

The approximation given by **26.6.15** will result in a maximum error of .0005. For this example we have

$$x=\frac{(1.714)^{1/3}\left(1-\frac{2}{9(40)}\right)-\left(1-\frac{2}{9(10)}\right)}{\left[\frac{2}{9(10)}+(1.714)^{2/3}\frac{2}{9(40)}\right]^{\frac{1}{2}}}=1.2222$$

Interpolating in **Table 26.1** results in

$$Q(1.714|10,40)\approx Q(1.2222)=1-P(1.2222)=.1108$$

The correct value to 5D is $Q(1.714|10,40)=.11108$.

On the other hand the approximation given by **26.6.14** which is usually less accurate results in

$$x=\frac{\sqrt{[2(40)-1]\left(\frac{10}{40}\right)(1.714)}-\sqrt{2(10)-1}}{\sqrt{1+\frac{10}{40}(1.714)}}=1.2210$$

and interpolating in **Table 26.1** gives

$$Q(1.714|10,40)\approx Q(1.2210)=1-P(1.2210)=.1112$$

### Calculation of $F$ Outside the Range of Table 26.9

**Example 24.** Find the value of $F$ for which $Q(F|10,20)\approx.0001$ using **26.6.16** and **26.5.22.**

For this problem we have $a=\frac{\nu_2}{2}=10$, $b=\frac{\nu_1}{2}=5$, $p=.0001$. The value of the normal deviate which cuts off .0001 in the tail of the distribution is $y=3.7190$ (i.e., $Q(3.7190)=.0001$). Hence substituting in **26.5.22** gives

$$h=2\left[\frac{1}{19}+\frac{1}{9}\right]^{-1}=12.2143$$

$$\lambda=\frac{3.7190^2-3}{6}=1.8052$$

$$w=3.7190\,\frac{(12.2143+1.8052)^{\frac{1}{2}}}{12.2143}-\left(\frac{1}{9}-\frac{1}{19}\right)\left[1.8052+.8333-\frac{2}{3(12.2143)}\right]$$

$$w=.9889$$

and thus $F\approx e^{2w}=7.23$. The correct answer is $F=7.180$.

### Approximating the Non-Central $F$-Distribution

**Example 25.** Compute $P(3.71|3,10,4)$ using the approximation **26.6.27** to the non-central $F$-distribution.

Using **26.6.27** with $\nu_1=3$, $\nu_2=10$, $\lambda=4$, $F'=3.71$ we have

$$x=\frac{\left[\left(\frac{3}{3+4}\right)(3.71)\right]^{1/3}\left[1-\frac{2}{9(10)}\right]-\left[1-\frac{2}{9}\frac{(3+8)}{(3+4)^2}\right]}{\left[\frac{2}{9}\frac{3+8}{(3+4)^2}+\frac{2}{9(10)}\left[\left(\frac{3}{3+4}\right)(3.71)\right]^{2/3}\right]^{\frac{1}{2}}}=.675$$

and interpolating in **Table 26.1** gives

$$P(3.71|3,10,4)\approx P(.675)=.750$$

The exact answer is $P(3.71|3,10,4)=.745$.

Nauk SSSR, Moscow-Leningrad, U.S.S.R., 1950). $\Gamma(\chi^2,\nu)=\left(\frac{1}{2}\chi^2\right)^{-\nu/2} P(\chi^2|\nu)$, $\mathscr{P}(t,\nu)=Q(\chi^2|\nu)$, $\Pi(t, x)=Q(\chi^2|\nu)$ where $t=(2\chi^2)^{\frac{1}{2}}-(2\nu)^{\frac{1}{2}}$, $x=(\nu/2)^{-\frac{1}{2}}$. $\Gamma(\chi^2,\nu)$, $\chi^2=0(.05)2(.1)10$, $\nu=0(.05)2(.1)6$; $Q(\chi^2|\nu)$, $\chi^2=0(.1)3.2$, $\nu=0(.05)2(.1)6$; $\chi^2=3.2(.2)7(.5)10(1)35$, $\nu=0(.1).4(.2)6$; $\mathscr{P}(t,\nu)$, $t=-4(.1)4.8$, $\nu=6(.5)11(1)32$; $\Pi(t,x)$: $t=-4.5(.1)4.8$, $x=0(.02).22(.01).25$, 5D.

### Incomplete Beta Function, Binomial Distribution

[26.33] Harvard University, Tables of the cumulative binomial probability distribution (Harvard Univ. Press, Cambridge, Mass., 1955). $\sum_{s=c}^{\infty}\binom{n}{s}p^s(1-p)^{n-s}$ for $p=.01(.01).5$, 1/16, 1/12, 1/8, 1/6, 3/16, 5/16, 1/3, 3/8, 5/12, 7/16, $n=1(1)50(2)100(10)200(20)500(50)1000$, 5D.

[26.34] National Bureau of Standards, Tables of the binomial probability distribution, Applied Math. Series 6 (U.S. Government Printing Office, Washington, D.C., 1950). $\binom{n}{s}p^s(1-p)^{n-s}$ and $\sum_{s=c}^{n}\binom{n}{s}p^s(1-p)^{n-s}$ for $p=.01(.01).5$, $n=2(1)49$, 7D.

[26.35] K. Pearson (Editor), Tables of the incomplete beta function, Biometrika Office, University College (Cambridge Univ. Press, Cambridge, England, 1948). $I_x(a,b)$ for $x=.01(.01)1$; $a,b=.5(.5)11(1)50$, $a\geq b$, 7D.

[26.36] W. H. Robertson, Tables of the binomial distribution function for small values of $p$, Office of Technical Services, U.S. Department of Commerce (1960). $\sum_{s=0}^{c}\binom{n}{s}p^s(1-p)^{n-s}$ for $p=.001(.001).02$, $n=2(1)100(2)200(10)500(20)1000$; $p=.021(.001).05$, $n=2(1)50(2)100(5)200(10)300(20)600(50)1000$, 5D.

[26.37] H. G. Romig, 50–100 Binomial tables (John Wiley & Sons, Inc., New York, N.Y., 1953). $\binom{n}{s}p^s(1-p)^{n-s}$ and $\sum_{s=0}^{c}\binom{n}{s}p^s(1-p)^{n-s}$ for $p=.01(.01).5$ and $n=50(5)100$, 6D.

[26.38] C. M. Thompson, Tables of percentage points of the incomplete beta function, Biometrika **32**, 151–181 (1941). Also reproduced as Table 16 in [26.11]. Tabulates values of $x$ for which * $I_x(a,b)=.005$, .01, .025, .05, .1, .25, .5; $2a=1(1)30$, 40, 60, 120, $\infty$; $2b=1(1)10$, 12, 15, 20, 24, 30, 40, 60, 120, 5D.

[26.39] U.S. Ordnance Corps, Tables of the cumulative binomial probabilities, ORDP 20–1, Office of Technical Services, Washington, D.C. (1952). $\sum_{s=c}^{n}\binom{n}{s}p^s(1-p)^{n-s}$ for $p=.01(.01).5$ and $n=1(1)150$, 7D.

### *F* (Variance-Ratio) and Non-Central *F* Distribution

[26.40] Table V of [26.7]. Tabulates values of $F$ and $Z=\frac{1}{2}\ln F$ for $Q(F|\nu_1,\nu_2)=.2$, .1, .05, .01, .001; $\nu_1=1(1)6$, 8, 12, 24, $\infty$; $\nu_2=1(1)30$, 40, 60, 120, $\infty$, 2D for $F$, 4D for $Z$.

[26.41] E. Lehmer, Inverse tables of probabilities of errors of the second kind, Ann. Math. Statist. **15**, 388–398 (1944). $\phi=\sqrt{\lambda/(\nu_1+1)}$ for $\nu_1=1(1)10$, 12, 15, 20, 24, 30, 40, 60, 120, $\infty$; $\nu_2=2(2)20$, 24, 30, 40, 60, 80, 120, 240, $\infty$ and $P(F'|\nu_1,\nu_2,\phi)=.2$, .3 where $Q(F'|\nu_1,\nu_2)=.01$, .05, 3D or 3S.

[26.42] M. Merrington and C. M. Thompson, Tables of percentage points of the inverted beta ($F$) distribution, Biometrika **33**, 73–88 (1943). Tabulates values of $F$ for which $Q(F|\nu_1,\nu_2)=.5$, .25, .1, .05, .025, .01, .005; $\nu_1=1(1)10$, 12, 15, 20, 24, 30, 40, 60, 120, $\infty$; $\nu_2=1(1)30$, 40, 60, 120, $\infty$.

[26.43] P. C. Tang, The power function of the analysis of variance tests with tables and illustrations of their use, Statistical Research Memoirs II, 126–149 and tables (1938). $P(F'|\nu_1,\nu_2,\phi)$ for $\nu_1=1(1)8$, $\nu_2=2(2)6(1)30$, 60, $\infty$ and $\phi=\sqrt{\lambda/\nu_1+1)}=1(.5)3(1)8$ where $Q(F'|\nu_1,\nu_2)=.01$, .05, 3D.

### Student's *t* and Non-Central *t*-Distributions

[26.44] E. T. Federighi, Extended tables of the percentage points of Student's $t$-distribution, J. Amer. Statist. Assoc. **54**, 683–688 (1959.) Values of $t$ for which $Q(t|\nu)=\frac{1}{2}[1-A(t|\nu)]=.25\times10^{-n}$, $.1\times10^{-n}$, $n=0(1)6$, $.05\times10^{-n}$, $n=0(1)5$, $\nu=1(1)30(5)60(10)100$, 200, 500, 1000, 2000, 10000, $\infty$; 3D.

[26.45] Table III of [26.7]. Values of $t$ for which $A(t|\nu)=.1(.1).9$, .95, .98, .99, .999 and $\nu=1(1)30$, 40, 60, 120, $\infty$; 3D.

[26.46] N. L. Johnson and B. L. Welch, Applications of the noncentral $t$-distribution, Biometrika **31**, 362–389 (1939). Tabulates an auxiliary function which enables calculation of $\delta$ for given $t'$ and $p$, or $t'$ for given $\delta$ and $p$ where $P(t'|\nu,\delta)=p=.005$, .01, .025, .05, .1(.1).9, .95, .975, .99, .995.

[26.47] J. Neyman and B. Tokarska, Errors of the second kind in testing Student's hypothesis, J. Amer. Statist. Assoc. **31**, 318–326 (1936). Tabulates $\delta$ for $P(t'|\nu,\delta)=.01$, .05, .1(.1).9; $\nu=1(1)30$, $\infty$; $Q(t'|\nu)=.01$, .05.

[26.48] Table 9 of [26.11]. $P(t|\nu)=\frac{1}{2}[1+A(t|\nu)]$ for $t=0(.1)4(.2)8$; $\nu=1(1)20$, 5D; $t=0(.05)2(.1)4$, 5; $\nu=20(1)24$, 30, 40, 60, 120, $\infty$, 5D.

[26.49] G. S. Resnikoff and G. J. Lieberman, Tables of the noncentral $t$-distribution (Stanford Univ. Press, Stanford, Calif., 1957). $\partial P(t'|\nu,\delta)/\partial t'$ and $P(t'|\nu,\delta)$ for $\nu=2(1)24(5)49$, $\delta=\sqrt{\nu+1}\,x_p$ where $Q(x_p)=p=.25$, .15, .1, .065, .04, .025, .01, .004, .0025, .001 and $t'/\sqrt{\nu}$ covers the range of values such that throughout most of the table the entries lie between 0 and 1, 4D.

Linear interpolation yields an error no greater than 5 units in the fifth decimal place.

$$Z(x)=\frac{1}{\sqrt{2\pi}}e^{-\frac{1}{2}x^2} \qquad P(x)=1-Q(x)=\int_{-\infty}^{x} Z(t)dt$$

For $Q(x)>0.007$, linear interpolation yields an error of one unit in the third decimal place; five-point interpolation is necessary to obtain full accuracy.

$$P(x)=1-Q(x)=\int_{-\infty}^{x} Z(t)dt$$

$$\phi=\tfrac{1}{2}\left(\chi^2-\chi_0^2\right) \qquad w=\nu-\nu_0>0$$

Interpolation on $\chi^2$

$$Q(\chi^2|\nu)=Q\left(\chi_0^2|\nu_0-4\right)\left[\tfrac{1}{2}\phi^2\right]+Q\left(\chi_0^2|\nu_0-2\right)\left[\phi-\phi^2\right]+Q\left(\chi_0^2|\nu_0\right)\left[1-\phi+\tfrac{1}{2}\phi^2\right]$$

Double Entry Interpolation

$$Q(\chi^2|\nu)=Q\left(\chi_0^2|\nu_0-4\right)\left[\tfrac{1}{2}\phi^2\right]+Q\left(\chi_0^2|\nu_0-2\right)\left[\phi-\phi^2-w\phi\right]+Q\left(\chi_0^2|\nu_0-1\right)\left[\tfrac{1}{2}w^2-\tfrac{1}{2}w+w\phi\right]$$
$$+Q\left(\chi_0^2|\nu_0\right)\left[1-w^2-\phi+\tfrac{1}{2}\phi^2+w\phi\right]+Q\left(\chi_0^2|\nu_0+1\right)\left[\tfrac{1}{2}w^2+\tfrac{1}{2}w-w\phi\right]$$

# 27. Miscellaneous Functions

IRENE A. STEGUN [1]

## Contents

Page

27.1. Debye Functions $\int_0^x \frac{t^n dt}{e^t-1}$ . . . . . . . . . . . . . . . . . . 998

$n=1(1)4$, $x=0(.1)1.4(.2)5(.5)10$, 6D

27.2. Planck's Radiation Function $x^{-5}(e^{1/x}-1)^{-1}$ . . . . . . . . . . . 999

$x=.05(.005).1(.01).2(.02).4(.05).9(.1)1.5(.5)3.5$, 3D

$x_{\max}$, $f(x_{\max})$, 9–10S

27.3. Einstein Functions . . . . . . . . . . . . . . . . . . . . . . 999

$\frac{x^2e^x}{(e^x-1)^2}$, $\frac{x}{e^x-1}$, $\ln(1-e^{-x})$, $\frac{x}{e^x-1}-\ln(1-e^{-x})$

$x=0(.05)1.5(.1)3(.2)6$, 5D

27.4. Sievert Integral $\int_0^\theta e^{-x\sec\phi}d\phi$ . . . . . . . . . . . . . . . . . . 1000

$x=0(.1)1(.2)3(.5)10$, $\theta=10°(10°)60°(15°)90°$, 6D

27.5. $f_m(x)=\int_0^\infty t^m e^{-t^2-\frac{x}{t}}\,dt$ and Related Integrals . . . . . . . . . . 1001

$f_m(x)$, $m=1, 2, 3$; $x=0(.01).05, .1(.1)1$, 4D

$f_3(ix)$, $x=0(.2)8(.5)15(1)20$, 4–5D

27.6. $f(x)=\int_0^\infty \frac{e^{-t^2}}{t+x}\,dt$ . . . . . . . . . . . . . . . . . . . . . 1003

$f(x)+\ln x$, $x=0(.05)1$

$f(x)$, $x=1(.1)3(.5)8$, 4D

27.7. Dilogarithm (Spence's Integral) $f(x)=-\int_1^x \frac{\ln t}{t-1}\,dt$ . . . . . . 1004

$x=0(.01).5$, 9D

27.8. Clausen's Integral and Related Summations . . . . . . . . . . 1005

$f(\theta)=-\int_0^\theta \ln\left(2\sin\frac{t}{2}\right)dt=\sum_{n=1}^{\infty}\frac{\sin n\theta}{n^2}$

$f(\theta)+\theta\ln\theta$, $\theta=0°(1°)15°$

$f(\theta)$, $\theta=15°(1°)30°(2°)90°(5°)180°$, 6D

27.9. Vector-Addition Coefficients $(j_1j_2m_1m_2|j_1j_2jm)$ . . . . . . . . . 1006

Algebraic Expressions for $j_2=1/2, 1, 3/2, 2$

Decimal Values for $j_2=1/2, 1, 3/2$, 5D

---

# 27. Miscellaneous Functions

## 27.1. Debye Functions

### Series Representations

**27.1.1**

$$\int_0^x \frac{t^n dt}{e^t-1}=x^n\left[\frac{1}{n}-\frac{x}{2(n+1)}+\sum_{k=1}^{\infty}\frac{B_{2k}x^{2k}}{(2k+n)(2k)!}\right]$$

$$(|x|<2\pi, n\geq 1)$$

(For Bernoulli numbers $B_{2k}$, see chapter **23**.)

**27.1.2**

$$\int_x^{\infty} \frac{t^n dt}{e^t-1}=\sum_{k=1}^{\infty} e^{-kx}\left[\frac{x^n}{k}+\frac{nx^{n-1}}{k^2}+\frac{(n)(n-1)x^{n-2}}{k^3}+\ldots+\frac{n!}{k^{n+1}}\right] (x>0, n\geq 1)$$

### Relation to Riemann Zeta Function (see chapter 23)

**27.1.3**

$$\int_0^{\infty} \frac{t^n dt}{e^t-1}=n!\zeta(n+1).$$

[27.1] J. A. Beattie, Six-place tables of the Debye energy and specific heat functions, J. Math. Phys. **6**, 1–32 (1926).

$$\frac{3}{x^3}\int_0^x \frac{y^3dy}{e^y-1}, \frac{12}{x^3}\left[\int_0^x \frac{y^3dy}{e^y-1}-\frac{3x}{e^x-1}\right], x=0(.01)24, \quad 6S.$$

[27.2] E. Grüneisen, Die Abhängigkeit des elektrischen Widerstandes reiner Metalle von der Temperatur, Ann. Physik. (5) **16**, 530–540 (1933).

$$\frac{20}{x^4}\int_0^x \frac{t^4dt}{e^t-1}-\frac{4x}{e^x-1},$$

$$x=0(.1)13(.2)18(1)20(2)52(4)80, \quad 4S.$$

[27.4] H. L. Johnston, L. Savedoff and J. Belzer, Contributions to the thermodynamic functions by a Planck-Einstein oscillator in one degree of freedom, NAVEXOS p. 646, Office of Naval Research, Department of the Navy, Washington, D.C. (1949). Values of $x^2e^x(e^x-1)^{-2}$, $x(e^x-1)^{-1}$, $-\ln(1-e^{-x})$ and $x(e^x-1)^{-1}-\ln(1-e^{-x})$ for $x=0(.001)3(.01)\,14.99$, 5D with first differences.

## 27.4. Sievert Integral

$$\int_0^\theta e^{-x\sec\phi}d\phi$$

### Relation to the Error Function

**27.4.1**

$$\int_0^\theta e^{-x\sec\phi}d\phi\sim\sqrt{\frac{\pi}{2x}}\,e^{-x}\operatorname{erf}\left(\sqrt{\frac{x}{2}}\,\theta\right)\qquad(x\to\infty)$$

(For erf, see chapter **7**.)

### Representation in Terms of Exponential Integrals

**27.4.2**

$$\int_0^\theta e^{-x\sec\phi}d\phi=\int_0^{\frac{\pi}{2}}e^{-x\sec\phi}d\phi-\sum_{k=0}^{\infty}\alpha_k(\cos\theta)^{2k+1}E_{2k+2}\left(\frac{x}{\cos\theta}\right)$$

$$\left(x\geq 0, 0<\theta<\frac{\pi}{2}\right)$$

$$\alpha_0=1,\alpha_k=\frac{1\cdot 3\cdot 5\ldots(2k-1)}{2\cdot 4\cdot 6\ldots(2k)}$$

(For $E_{2k+2}(x)$, see chapter **5**.)

### Relation to the Integral of the Bessel Function $K_0(x)$

**27.4.3**

$$\int_0^{\frac{\pi}{2}}e^{-x\sec\phi}d\phi=\mathrm{Ki}_1(x)=\int_x^\infty K_0(t)dt\text{ where}$$

$$x^{\frac{1}{2}}e^x\mathrm{Ki}_1(x)\sim(\tfrac{1}{2}\pi)^{\frac{1}{2}}\left\{1-\frac{5}{8x}+\frac{129}{128x^2}-\frac{2655}{1024x^3}+\frac{301035}{32768x^4}-\ldots\right\}$$

(For $\mathrm{Ki}_r(x)$, see chapter **11**.)

## 27.5. $f_m(x)=\int_0^{\infty} t^m e^{-t^2-\frac{x}{t}}\, dt$ and Related Integrals

$m=0, 1, 2 \ldots$

### Differential Equations

**27.5.1** $$x f_m''' - (m-1) f_m'' + 2 f_m = 0$$

**27.5.2** $$f_m' = -f_{m-1} \qquad (m=1, 2, \ldots)$$

### Recurrence Relation

**27.5.3** $$2 f_m = (m-1) f_{m-2} + x f_{m-3} \qquad (m \geq 3)$$

### Power Series Representations

**27.5.4** $$2 f_1(x) = \sum_{k=0}^{\infty} (a_k \ln x + b_k) x^k$$

$$a_k = \frac{-2a_{k-2}}{k(k-1)(k-2)} \qquad b_k = \frac{-2b_{k-2} - (3k^2 - 6k + 2) a_k}{k(k-1)(k-2)}$$

$$a_0 = a_1 = 0 \qquad a_2 = -b_0$$

$$b_0 = 1 \qquad b_1 = -\sqrt{\pi} \qquad b_2 = \frac{3}{2}(1-\gamma)$$

(For $\gamma$, see chapter **6**.)

**27.5.5**

$$2f_1(x)=1-\sqrt{\pi}x+.6342x^2+.5908x^3-.1431x^4$$
$$-.01968x^5+.00324x^6+.000188x^7\ldots$$
$$-x^2\ln x(1-.08333x^2+.001389x^4-.0000083x^6+\ldots)$$

**27.5.6**

$$2f_2(x)=\frac{\sqrt{\pi}}{2}-x+\frac{\sqrt{\pi}}{2}x^2-.3225x^3-.1477x^4+.03195x^5$$
$$+.00328x^6-.000491x^7-.0000235x^8\ldots$$
$$+x^3\ln x(\tfrac{1}{3}-.01667x^2+.000198x^4-\ldots)$$

**27.5.7**

$$2f_3(x)=1-\frac{\sqrt{\pi}}{2}x+\frac{x^2}{2}-.2954x^3+.1014x^4+.02954x^5$$
$$-.00578x^6-.00047x^7+.000064x^8\ldots$$
$$-x^4\ln x(.0833-.00278x^2+.000025x^4-\ldots)$$

### Asymptotic Representation

**27.5.8**

$$f_m(x)\sim\sqrt{\frac{\pi}{3}}\,3^{-\frac{m}{2}}v^{\frac{m}{2}}e^{-v}\left(a_0+\frac{a_1}{v}+\frac{a_2}{v^2}+\ldots+\frac{a_k}{v^k}+\ldots\right)\qquad(x\to\infty)$$

$$v=3\left(\frac{x}{2}\right)^{2/3}$$

$$a_0=1,\ a_1=\frac{1}{12}(3m^2+3m-1)$$

$$12(k+2)a_{k+2}=-(12k^2+36k-3m^2-3m+25)a_{k+1}$$
$$+\tfrac{1}{2}(m-2k)(2k+3-m)(2k+3+2m)a_k\qquad(k=0,1,2\ldots)$$

**27.5.9** $$g_1(x)+ig_2(x)=\int_0^\infty t^3e^{-t^2+i\frac{x}{t}}dt$$

**27.5.10**

$$g_1(x)=\mathscr{R}f_3(ix)\qquad g_2(x)=-\mathscr{I}f_3(ix)$$

### Asymptotic Representation

**27.5.11**

$$g_1(x)=\left(\frac{\pi}{3}\right)^{1/2}\frac{x}{2}\exp\left[-\frac{3}{2}\left(\frac{x}{2}\right)^{2/3}\right](A\sin\theta+B\cos\theta)$$

**27.5.12**

$$g_2(x)=-\left(\frac{\pi}{3}\right)^{1/2}\frac{x}{2}\exp\left[-\frac{3}{2}\left(\frac{x}{2}\right)^{2/3}\right](A\cos\theta-B\sin\theta)$$

$$\theta=\frac{3}{2}\sqrt{3}\left(\frac{x}{2}\right)^{2/3}$$

$$A\sim a_0-a_3\left(\frac{2}{x}\right)^2+\frac{1}{2}\left[a_1\left(\frac{2}{x}\right)^{2/3}-a_2\left(\frac{2}{x}\right)^{4/3}\right.$$
$$\left.-a_4\left(\frac{2}{x}\right)^{8/3}+a_5\left(\frac{2}{x}\right)^{10/3}-\ldots\right]\qquad(x\to\infty)$$

$$B\sim\frac{\sqrt{3}}{2}\left[a_1\left(\frac{2}{x}\right)^{2/3}+a_2\left(\frac{2}{x}\right)^{4/3}-a_4\left(\frac{2}{x}\right)^{8/3}\right.$$
$$\left.-a_5\left(\frac{2}{x}\right)^{10/3}+\ldots\right]\qquad(x\to\infty)$$

$$a_0=1\qquad a_1=.972222\qquad a_2=.148534$$
$$a_3=-.017879\qquad a_4=.004594\qquad a_5=-.000762$$

## 27.6. $f(x)=\int_0^\infty \frac{e^{-t^2}}{t+x}\,dt$

### Power Series Representation

**27.6.1**

$$f(x)=-e^{-x^2}\ln x+e^{-x^2}\left[\sqrt{\pi}\sum_{k=0}^{\infty}\frac{x^{2k+1}}{k!(2k+1)}-\sum_{k=1}^{\infty}\frac{x^{2k}}{k!\,2k}-\frac{\gamma}{2}\right]$$

**27.6.2**

$$=-e^{-x^2}\ln x+\frac{1}{2}\sum_{k=0}^{\infty}\frac{(-1)^k\psi(k+1)x^{2k}}{k!}+\sqrt{\pi}\sum_{k=0}^{\infty}\frac{(-2)^k x^{2k+1}}{1\cdot 3\cdot 5\ldots(2k+1)}$$

(For $\gamma$ and the digamma function $\psi(x)$, see chapter 6.)

### Relation to the Exponential Integral

**27.6.3** $f(x)=-\frac{1}{2}e^{-x^2}\,\mathrm{Ei}\,(x^2)+\sqrt{\pi}e^{-x^2}\int_0^x e^{t^2}dt$

(For Ei $(x)$ see chapter 5; $e^{-x^2}\int_0^x e^{t^2}\,dt$, see chapter 7.

### Asymptotic Representation

**27.6.4**

$$f(x)\sim\frac{\sqrt{\pi}}{2}\left[\frac{1}{x}+\frac{1}{2x^3}+\frac{1\cdot 3}{4x^5}+\frac{1\cdot 3\cdot 5}{8x^7}+\ldots\right]-\frac{1}{2}\left[\frac{1}{x^2}+\frac{1}{x^4}+\frac{2!}{x^6}+\frac{3!}{x^8}+\ldots\right]\qquad(x\to\infty)$$

## 27.7. Dilogarithm

### (Spence's Integral for $n=2$)

**27.7.1** $$f(x)=-\int_1^x \frac{\ln t}{t-1}\,dt$$

### Series Expansion

**27.7.2** $$f(x)=\sum_{k=1}^{\infty}(-1)^k\frac{(x-1)^k}{k^2}\qquad(2\geq x\geq 0)$$

### Functional Relationships

**27.7.3**

$$f(x)+f(1-x)=-\ln x\ln(1-x)+\frac{\pi^2}{6}\qquad(1\geq x\geq 0)$$

**27.7.4**

$$f(1-x)+f(1+x)=\frac{1}{2}f(1-x^2)\qquad(1\geq x>0)$$

**27.7.5** $$f(x)+f\left(\frac{1}{x}\right)=-\frac{1}{2}(\ln x)^2\qquad(0\leq x\leq 1)$$

**27.7.6**

$$f(x+1)-f(x)=-\ln x\ln(x+1)-\frac{\pi^2}{12}-\frac{1}{2}f(x^2)\qquad(2\geq x\geq 0)$$

### Relation to Debye Functions

**27.7.7** $$f(e^{-t})=-f(e^t)-\frac{t^2}{2}=\int_0^t\frac{t\,dt}{e^t-1}$$

From K. Mitchell, Tables of the function $\int_0^z \frac{-\log|1-y|}{y}dy$, with an account of some properties of this and related functions, Phil. Mag. **40,** 351–368 (1949) (with permission).

## 27.8. Clausen's Integral and Related Summations

**27.8.1**

$$f(\theta)=-\int_0^\theta \ln\left(2\sin\frac{t}{2}\right)dt=\sum_{k=1}^\infty \frac{\sin k\theta}{k^2} \qquad (0\leq\theta\leq\pi)$$

### Series Representation

**27.8.2**

$$f(\theta)=-\theta\ \ln|\theta|+\theta+\sum_{k=1}^\infty \frac{(-1)^{k-1}}{(2k)!}B_{2k}\frac{\theta^{2k+1}}{2k(2k+1)} \qquad \left(0\leq\theta<\frac{\pi}{2}\right)$$

**27.8.3**

$$f(\pi-\theta)=\theta\ln 2-\sum_{k=1}^\infty \frac{(-1)^{k-1}}{(2k)!}B_{2k}(2^{2k}-1)\frac{\theta^{2k+1}}{2k(2k+1)} \qquad (\pi/2<\theta<\pi)$$

### Functional Relationship

**27.8.4** $f(\pi-\theta)=f(\theta)-\frac{1}{2}f(2\theta) \qquad \left(0\leq\theta\leq\frac{\pi}{2}\right)$

### Relation to Spence's Integral

**27.8.5**

$$if(\theta)=g(e^{i\theta})+\frac{\theta^2}{4} \text{ where } g(x)=\int_1^x \frac{dt}{t}\ln|1+t|$$

### Summable Series

**27.8.6**

$$\sum_{n=1}^\infty \frac{\cos n\theta}{n}=-\ln\left(2\sin\frac{\theta}{2}\right) \qquad (0<\theta<2\pi)$$

$$\sum_{n=1}^\infty \frac{\cos n\theta}{n^2}=\frac{\pi^2}{6}-\frac{\pi\theta}{2}+\frac{\theta^2}{4} \qquad (0\leq\theta\leq2\pi)$$

$$\sum_{n=1}^\infty \frac{\cos n\theta}{n^4}=\frac{\pi^4}{90}-\frac{\pi^2\theta^2}{12}+\frac{\pi\theta^3}{12}-\frac{\theta^4}{48} \qquad (0\leq\theta\leq2\pi)$$

$$\sum_{n=1}^\infty \frac{\sin n\theta}{n}=\frac{1}{2}(\pi-\theta) \qquad (0<\theta<2\pi)$$

$$\sum_{n=1}^\infty \frac{\sin n\theta}{n^3}=\frac{\pi^2\theta}{6}-\frac{\pi\theta^2}{4}+\frac{\theta^3}{12} \qquad (0\leq\theta\leq2\pi)$$

$$\sum_{n=1}^\infty \frac{\sin n\theta}{n^5}=\frac{\pi^4\theta}{90}-\frac{\pi^2\theta^3}{36}+\frac{\pi\theta^4}{48}-\frac{\theta^5}{240} \qquad (0\leq\theta\leq2\pi)$$

## 27.9. Vector-Addition Coefficients

### (Wigner coefficients or Clebsch-Gordan coefficients)

### Definition

**27.9.1**

$$(j_1j_2m_1m_2|j_1j_2jm)=\delta(m,\ m_1+m_2)\cdot\sqrt{\frac{(j_1+j_2-j)!(j+j_1-j_2)!(j+j_2-j_1)!(2j+1)}{(j+j_1+j_2+1)!}}$$

$$\cdot\sum_k\frac{(-1)^k\sqrt{(j_1+m_1)!(j_1-m_1)!(j_2+m_2)!(j_2-m_2)!(j+m)!(j-m)!}}{k!(j_1+j_2-j-k)!(j_1-m_1-k)!(j_2+m_2-k)!(j-j_2+m_1+k)!(j-j_1-m_2+k)!}$$

$$\delta(i,\ k)=\begin{cases}1, & i=k\\ 0, & i\neq k\end{cases}$$

### Conditions

**27.9.2** $j_1,\ j_2,\ j=+n$ or $+\frac{n}{2}$. ($n$=integer)

**27.9.3** $j_1+j_2+j=n$

**27.9.4** $j_1+j_2-j$

**27.9.5** $j_1-j_2+j$

**27.9.6** $-j_1+j_2+j$

$$\left.\begin{array}{l}j_1+j_2-j\\ j_1-j_2+j\\ -j_1+j_2+j\end{array}\right\}\geq 0$$

**27.9.7** $m_1,\ m_2,\ m=\pm n$ or $\pm\frac{n}{2}$

**27.9.8** $|m_1|\leq j_1,\ |m_2|\leq j_2,\ |m|\leq j$

**27.9.9** $(j_1j_2m_1m_2|j_1j_2jm)=0$ $\qquad m_1+m_2\neq m$

### Special Values

**27.9.10** $(j_10m_10|j_10jm)=\delta(j_1,\ j)\delta(m_1,\ m)$

**27.9.11** $(j_1j_200|j_1j_2j0)=0$ $\qquad j_1+j_2+j=2n+1$

**27.9.12** $(j_1j_1m_1m_1|j_1j_1jm)=0$ $\qquad 2j_1+j=2n+1$

### Symmetry Relations

**27.9.13**

$$(j_1j_2m_1m_2|j_1j_2jm)$$

$$=(-1)^{j_1+j_2-j}(j_1j_2-m_1-m_2|j_1j_2j-m)$$

**27.9.14** $$=(j_2j_1-m_2-m_1|j_2j_1j-m)$$

**27.9.15** $$=(-1)^{j_1+j_2-j}(j_2j_1m_1m_2|j_2j_1jm)$$

**27.9.16**

$$=\sqrt{\frac{2j+1}{2j_1+1}}\,(-1)^{j_2+m_2}(jj_2-mm_2|jj_2j_1-m_1)$$

**27.9.17**

$$=\sqrt{\frac{2j+1}{2j_1+1}}\,(-1)^{j_1-m_1+j-m}(jj_2m-m_2|jj_2j_1m_1)$$

**27.9.18**

$$=\sqrt{\frac{2j+1}{2j_1+1}}\,(-1)^{j-m+j_1-m_1}(j_2jm_2-m|j_2jj_1-m_1)$$

**27.9.19**

$$=\sqrt{\frac{2j+1}{2j_2+1}}\,(-1)^{j_1-m_1}(j_1jm_1-m|j_1jj_2-m_2)$$

**27.9.20**

$$=\sqrt{\frac{2j+1}{2j_2+1}}\,(-1)^{j_1-m_1}(jj_1m-m_1|jj_1j_2m_2)$$

# 28. Scales of Notation

## Representation of Numbers

Any positive real number $x$ can be uniquely represented in the scale of some integer $b>1$ as

$$x=(A_m \ . \ . \ . \ A_1A_0 \cdot a_{-1}a_{-2} \ . \ . \ .)_{(b)},$$

where every $A_i$ and $a_{-j}$ is one of the integers 0, 1, . . ., $b-1$, not all $A_i$, $a_{-j}$ are zero, and $A_m>0$ if $x\geq 1$. There is a one-to-one correspondence between the number and the sequence

$$x=A_mb^m+ \ . \ . \ . \ +A_1b+A_0+\sum_1^\infty a_{-j}b^{-j}$$

where the infinite series converges. The integer $b$ is called the base or radix of the scale.

The sequence for $x$ in the scale of $b$ may terminate, i.e., $a_{-n-1}=a_{-n-2}= \ . \ . \ . \ =0$ for some $n\geq 1$ so that

$$x=(A_m \ . \ . \ . \ A_1A_0 \cdot a_{-1}a_{-2} \ . \ . \ . \ a_{-n})_{(b)};$$

then $x$ is said to be a finite $b$-adic number.

A sequence which does not terminate may have the property that the infinite sequence $a_{-1}$, $a_{-2}$, . . . becomes periodic from a certain digit $a_{-n}(n\geq 1)$ on; according as $n=1$ or $n>1$ the sequence is then said to be pure or mixed recurring.

A sequence which neither terminates nor recurs represents an irrational number.

### Names of Scales

| Base | Scale | Base | Scale |
|---|---|---|---|
| 2 | Binary | 8 | Octal |
| 3 | Ternary | 9 | Nonary |
| 4 | Quaternary | 10 | Decimal |
| 5 | Quinary | 11 | Undenary |
| 6 | Senary | 12 | Duodenary |
| 7 | Septenary | 16 | Hexadecimal |

### General Conversion Methods

Any number can be converted from the scale of $b$ to the scale of some integer $\bar{b}\neq b$, $\bar{b}>1$, by using arithmetic operations in either the $b$-scale or the $\bar{b}$-scale. Accordingly, there are four methods of conversion, depending on whether the number to be converted is an integer or a proper fraction.

#### Integers $X=(A_m \ . \ . \ . \ A_1A_0)_{(b)}$

(I) $b$-scale arithmetic. Convert $\bar{b}$ to the $b$-scale and define

$$X/\bar{b}=X_1+\bar{A}_0'/\bar{b},$$

$$X_1/\bar{b}=X_2+\bar{A}_1'/\bar{b},$$

$$\vdots$$

$$X_{\bar{m}}/\bar{b}=0+\bar{A}_{\bar{m}}'/\bar{b},$$

where $\bar{A}_0'$, $\bar{A}_1'$, . . ., $\bar{A}_{\bar{m}}'$ are the remainders and $X_1$, $X_2$, . . ., $X_{\bar{m}}$ the quotients (in the $b$-scale) where $X$, $X_1$, . . ., $X_{\bar{m}-1}$, respectively are divided by $\bar{b}$ in the $b$-scale. Then convert the remainders to the $\bar{b}$-scale,

$$(\bar{A}_0')_{(\bar{b})}=\bar{A}_0,\ (\bar{A}_1')_{(\bar{b})}=\bar{A}_1,\ . \ . \ .,\ (\bar{A}_{\bar{m}}')_{(\bar{b})}=\bar{A}_{\bar{m}}$$

and obtain

$$X=(\bar{A}_{\bar{m}} \ . \ . \ . \ \bar{A}_1\bar{A}_0)_{(\bar{b})}.$$

(II) $\bar{b}$-scale arithmetic. Convert $b$ and $A_0$, $A_1$, . . ., $A_m$ to the $\bar{b}$-scale and define, using arithmetic operations in the $\bar{b}$-scale,

$$X_{m-1}=A_mb+A_{m-1},$$

$$X_{m-2}=X_{m-1}b+A_{m-2},$$

$$X_1=X_2b+A_1,$$

then

$$X=X_1b+A_0.$$

#### Proper fractions $x=(0.a_{-1}a_{-2} \ . \ . \ .)_{(b)}$

To convert a proper fraction $x$, given to $n$ digits in the $b$-scale, to the scale of $\bar{b}\neq b$ such that inverse conversion from the $\bar{b}$-scale may yield the same $n$ rounded digits in the $b$-scale, the representation of $x$ in the $\bar{b}$-scale must be obtained to $\bar{n}$ rounded digits where $n$ satisfies $\bar{b}^{\bar{n}}>b^n$.

(III) $b$-scale arithmetic. Convert $\bar{b}$ to the $b$-scale and define

$$x\bar{b}=x_1+\bar{a}_{-1}'$$

$$x_1\bar{b}=x_2+\bar{a}_{-2}'$$

$$x_{\bar{n}-1}\bar{b}=x_{\bar{n}}+\bar{a}_{-\bar{n}}'$$

where $\bar{a}_{-1}, \bar{a}'_{-2}, \ldots, \bar{a}_{-\bar{n}}$ are the integral parts and $x_1, x_2, \ldots, x_{\bar{n}}$ the fractional parts (in the $b$-scale) of the products $x\bar{b}, x_1\bar{b}, \ldots, x_{\bar{n}-1}\bar{b}$, respectively. Then convert the integral parts to the $\bar{b}$-scale,

$$(\bar{a}'_{-1})_{(\bar{b})}=\bar{a}_{-1},\ (\bar{a}'_{-2})_{(\bar{b})}=\bar{a}_{-2},\ \ldots,\ (\bar{a}'_{-n})_{(\bar{b})}=\bar{a}_{-n},$$

and obtain

$$x=(0.\bar{a}_{-1}\bar{a}_{-2}\ \ldots\ \bar{a}_{-n})_{(\bar{b})}.$$

(IV) $\bar{b}$-scale arithmetic. Convert $b$ and $a_{-1}, a_{-2}, \ldots, a_{-n}$ to the $\bar{b}$-scale and define, using arithmetic operations in the $\bar{b}$-scale,

$$x_{-n+1}=a_{-n}/b+a_{-n+1},$$

$$x_{-n+2}=x_{-n+1}/b+a_{-n+2},$$

$$x_{-1}=x_2/b+a_{-1};$$

then

$$x=x_{-1}/b.$$

## Numerical Methods

The examples are restricted to the scales of 2, 8, 10 because of their importance to electronic computers.

Note that the octal scale is a power of the binary scale. In fact, an octal digit corresponds to a triplet of binary digits. Then, binary arithmetic may be used whenever a number either is to be converted to the octal scale or is given in the octal scale and is to be converted to some other scale.

| Decimal | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|---|---|---|---|---|---|---|---|---|---|---|
| Octal | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 10 | 11 | 12 |
| Binary | 1 | 10 | 11 | 100 | 101 | 110 | 111 | 1 000 | 1 001 | 1 010 |

**Example 1.** Convert $X=(1369)_{(10)}$ to the octal scale. By (I) we have $b=10$, $\bar{b}=8_{(10)}$ and so, using decimal arithmetic,

$$1369/8=171+1/8,$$

$$171/8=21+3/8,$$

$$21/8=2+5/8,$$

$$2/8=0+2/8;$$

then

$$X=(2531)_{(8)}.$$

By (II) we have $b=(12)_{(8)}$ and $A_3=1_{(8)}$, $A_2=3_{(8)}$, $A_1=6_{(8)}$, $A_0=(11)_{(8)}$. Hence, using octal arithmetic,

$$X_2=1\cdot12+3=(15)_{(8)},$$

$$X_1=15\cdot12+6=(210)_{(8)},$$

$$X=210\cdot12+11=(2531)_{(8)}.$$

Using binary arithmetic we have, by (II), $b=(1010)_{(2)}$ and $A_3=1_{(2)}$, $A_2=(11)_{(2)}$, $A_1=(110)_{(2)}$, $A_0(1001)_{(2)}$. Thus

$$X_2=1\cdot1010+11=(1101)_{(2)},$$

$$X_1=1101\cdot1010+110=(10\ 001\ 000)_{(2)},$$

$$X=10\ 001\ 000\cdot1010+1001=(10\ 101\ 011\ 001)_{(2)},$$

whence, on converting to the octal scale,

$$X=(2531)_{(8)}.$$

**Example 2.** Convert $X=(2531)_{(8)}$ to the decimal scale. By (I) we have $\bar{b}=10=(12)_{(8)}$ and hence, using octal arithmetic,

$$2531/12=210+11/12$$

$$210/12=15+6/12$$

$$15/12=1+3/12$$

$$1/12=0+1/12$$

Thus, converting to the decimal scale,

$$\bar{A}_0=(11)_{(8)}=9,\ \bar{A}_1=6_{(8)}=6,\ \bar{A}_2=3_{(8)}=3,\ \bar{A}_3=1,$$

and so

$$X=(1369)_{(10)}.$$

By (II) we have $\bar{b}=10$, and the octal digits of $X$ are unchanged in the decimal scale. Hence, using decimal arithmetic,

$$X_2=2\cdot8+5=(21)_{(10)},$$

$$X_1=21\cdot8+3=(171)_{(10)},$$

$$X=171\cdot8+1=(1369)_{(10)}.$$

Using binary arithmetic we have, by (II), $b=8=(1000)_{(2)}$ and $A_0=1, A_1=(11)_{(2)}, A_2=(101)_{(2)}, A_3=(10)_{(2)}$. Then,

$$X_2=10\cdot1000+101=(10\ 101)_{(2)},$$

$$X_1=10\ 101\cdot1000+11=(10\ 101\ 011)_{(2)},$$

$$X=10\ 101\ 011\cdot1000+1=(10\ 101\ 011\ 001)_{(2)},$$

whence, on converting to the decimal scale,

$$X=(1369)_{(10)}.$$

Observe that in both examples above, octal arithmetic is used as an intermediate step to convert, according to (II), the given number to the binary scale. If, instead, the given number is first converted to the binary scale, then binary arithmetic may be applied directly to convert, according to (I), the given number from the binary scale to the scale desired.

For example, in converting $X=(2531)_{(8)}$ to the decimal scale, we find first $X=(10101011001)_{(2)}$ and then obtain, using (I) with $\bar{b}=10=(1010)_{(2)}$,

$$10\ 101\ 011\ 001/1010=10\ 001\ 000+1001/1010,$$
$$10\ 001\ 000/1010=1101+110/1010,$$
$$1101/1010=1+11/1010,$$
$$1/1010=0+1/1010.$$

Thus, on converting to the decimal scale,

$$A_0=(1001)_{(2)}=9,\ A_1=(110)_{(2)}=6,\ A_2=(11)_{(2)}=3,\ A_3=1,$$

whence

$$X=(1369)_{(10)}.$$

**Example 3.** Convert $x=(0.355)_{(10)}$ to the binary scale.

We first convert to the octal scale, using decimal arithmetic. By (III), we find with $\bar{b}=8$

$$(0.355)\cdot 8=2+0.840,\quad (0.080)\cdot 8=0+0.640$$
$$(0.840)\cdot 8=6+0.720,\quad (0.640)\cdot 8=5+0.120$$
$$(0.720)\cdot 8=5+0.760,\quad (0.120)\cdot 8=0+0.960$$
$$(0.760)\cdot 8=6+0.080,\quad (0.960)\cdot 8=7+0.680$$

whence $x=(0.26560507\ .\ .\ .)_{(8)}$. Thus, on converting to the binary scale,

$$x=(0.010\ 110\ 101\ 110\ 000\ 101\ 000\ 111\ .\ .\ .)_{(2)}.$$

In order that inverse conversion of $x$ from the binary to the decimal scale yield again $x$ to the given number $n$ of decimal digits, we must round $x$ in the binary scale to at least $\bar{n}$ digits where $\bar{n}$ is chosen such that $2^{\bar{n}}>10^{n}$. As a working rule, we may take $\bar{n}\geq\frac{10}{3}n$. Hence, to obtain $x=(0.355)_{(10)}$ by inverse conversion, $x$ must be rounded in the binary scale to $\bar{n}\geq\frac{10}{3}3=10$ digits.

Thus,

$$x=(0.010\ 110\ 110\ 0)_{(2)}.$$

To carry out the inverse conversion we can first convert to the octal scale,

$$x=(0.266)_{(8)},$$

and then apply (IV) with $b=8$, using decimal arithmetic:

$$x_{-2}=6/8+6=6.75,$$
$$x_{-1}=6.75/8+2=2.84375,$$
$$x=2.84375/8=0.355\ 46875.$$

Alternatively, we can apply (III) with $\bar{b}=(1010)_{(2)}$, using binary arithmetic:

$$(0.010\ 110\ 11)\cdot 1010=11+(0.100\ 011\ 1),$$
$$(0.100\ 011\ 1)\cdot 1010=101+(0.100\ 011),$$
$$(0.100\ 011)\cdot 1010=101+(0.011\ 11),$$
$$(0.011\ 11)\cdot 1010=100+(0.101\ 1).$$

Converting the integral parts to the decimal scale, we find

$$\bar{a}_{-1}=(11)_{(2)}=3,\ \bar{a}_{-2}=\bar{a}_{-3}=(101)_{(2)}=5,\ \bar{a}_{-4}=(100)_{(2)}=4,$$

and thus

$$x=(0.3554)_{(10)}$$

Note that the fractional part in any step is the unconverted remainder. Thus, to round at any step, it is only necessary to ascertain whether the unconverted portion to be neglected is greater or less than $\frac{1}{2}$; i.e., whether, in the binary scale, the first neglected digit is 1 or 0.

**Example 4.** Convert $x=(3.141593)_{(10)}\cdot 10^{-9}$ to the binary scale.

The desired representation is

$$x=(1.a_{-1}a_{-2}\ .\ .\ .\ a_{-n})_{(2)}\cdot 2^{-k}$$

where $n$ and $k$ are such that inverse conversion from the binary scale to the decimal scale will produce $x$ to the same given 15 decimal digits. Accordingly, by the rule stated in **Example 3,** $n$ and $k$ are to be chosen so as to satisfy $n+k\geq\frac{10}{3}\cdot 15=50$.

From **Table 28.1** we find

$$2^{-29}<(3.141593)_{(10)}\cdot 10^{-9}<2^{-28}$$

Thus, we must take $k=29$ and, consequently, choose $n>21$. The conversion on a desk calculator thus proceeds as follows. First, we obtain by use of **Table 28.1**

$$2^{29}x=(1.686\ 629\ 899)_{(10)}$$

Then, for convenience's sake, we convert this number to the octal scale, using the method of **Example 3** and rounding as required, to at least 7 octal (=21 binary) digits. We find

$$2^{29}x=(1.537\ 4337)_{(8)}.$$

Hence

$$x=(1.537\ \ 433\ \ 7)_{(8)}\cdot 2^{-29}$$

and, consequently,

$$x=(1.\ 101\ 011\ 111\ 100\ 011\ 011\ 111)_{(2)}\cdot 2^{-29}.$$

To convert $x$ back to the decimal scale we only need to obtain from **Table 28.1** the various powers of 2 which appear in the above representation and sum them. However, since $2^{-m}=2^{-m+1}-2^{-m}$ for any real constant $m$, it is more convenient to reduce first the binary representation of $x$ to the form

$$x=2^{-28}-2^{-31}-2^{-33}-2^{-39}+2^{-42}-2^{-45}-2^{-50}$$

and then sum these powers of 2. (Note that the number of summands is thereby decreased from 16 to 7.) From **Table 28.1** we have

$$\begin{array}{rrrrl}
+2^{-28}=+3.725 & 290 & 298 & \cdot 10^{-9} \\
-2^{-31}=-\ \ .465 & 661 & 287 & \cdot 10^{-9} \\
-2^{-33}=-\ \ .116 & 415 & 322 & \cdot 10^{-9} \\
-2^{-39}=-\ \ .001 & 818 & 989 & \cdot 10^{-9} \\
+2^{-42}=+\ \ .000 & 227 & 374 & \cdot 10^{-9} \\
-2^{-45}=-\ \ .000 & 028 & 422 & \cdot 10^{-9} \\
-2^{-50}=-\ \ .000 & 000 & 888 & \cdot 10^{-9} \\
\hline
x=\ \ 3.141 & 592 & 764 & \cdot 10^{-9}
\end{array}$$

Nine decimal digits are used for sufficient accuracy reserve. Hence, rounding to seven significant figures, we find

$$x=(3.141593)_{(10)}\cdot 10^{-9}.$$

To convert a number such as

$$x=(\xi)_{(10)}\cdot 10^{k}$$

to the binary scale, where $k$ is a positive integer so large that **Table 28.1** cannot be used, apply the following device: Compute

$$\log_2 x=\frac{\log_{10} x}{\log_{10} 2}=k+\frac{x_1}{\log_{10} 2}$$

where $k$ is the quotient and $x_1$ the remainder, the division being carried out in the decimal scale. Then find $\eta=10^{x_1}$, i.e., $x_1=\log_{10}\eta$, so that

$$\log_2 x=k+\frac{\log_{10}\eta}{\log_{10} 2}=k+\log_2\eta$$

whence

$$x=(\eta)_{(10)}2^{k}.$$

Now convert $(\eta)_{(10)}$ to the binary scale by any of the methods described above.

A similar device may be used to convert to the decimal scale a binary number that is outside the range of **Table 28.1.**

**Example 5.** Convert $x=(2.773)_{(10)}\cdot 10^{83}$ to the binary scale.

We first compute, using **4.1.19** and **Table 4.1,**

$$\log_2 x=\frac{\log_{10} x}{\log_{10} 2}=\frac{83.44295}{.30103}=277+\frac{.05764}{.30103},$$

and find from **Table 4.1,** $.05764=\log_{10} 1.1419$. Hence

$$\log_2 x=277+\frac{\log_{10} 1.1419}{\log_{10} 2}=277+\log_2 1.1419$$

and so

$$x=(1.1419)_{(10)}\cdot 2^{277}.$$

Now we apply the methods of **Example 3** to obtain $(1.1419)_{(10)}=(1.110516)_{(8)}$ where octal notation is used for the sake of convenience.

To round such that inverse conversion will yield the same decimal digits of $x$, observe that the last non-zero decimal digit of $x$ is $3\cdot 10^{80}$. **Table 28.4** shows that $2^{265}<10^{80}<2^{266}$. Hence, in the binary scale, $x$ must be a binary integer times $2^{265}$; i.e., $(1.110516)_{(8)}$ must be rounded to 4 octal (=12 binary) digits. As a result,

$$\begin{aligned}x&=(1.1105)_{(8)}\cdot 2^{277}=(11105)_{(8)}\cdot 2^{265}\\ &=(1\ 001\ 001\ 000\ 101)_{(2)}2^{265}\end{aligned}$$

Conversion back to the decimal scale proceeds as follows, we write

$$\begin{aligned}\log_{10} x&=\log_{10} 2\,\log_2 x\\
&=\log_{10} 2\{265+\log_2 (11105)_{(8)}\}\\
&=\log_{10} 2\left\{265+\frac{\log_{10} (11105)_{(8)}}{\log_{10} 2}\right\}\\
&=265\log_{10} 2+\log_{10} (11105)_{(8)}.\end{aligned}$$

Hence, converting $(11105)_{(8)}$ to the decimal scale by any of the methods of **Example 2,** we obtain

$$\log_{10} x=265\log_{10} 2+\log_{10} 4677$$

which yields, using **Table 4.1**

$$\log_{10} x=83.44292$$

Thus, by **Table 4.1,** we find, rounded to four significant figures,

$$x=(2.773)_{(10)}\cdot 10^{83}.$$

# 29. Laplace Transforms

## 29.1. Definition of the Laplace Transform

### One-dimensional Laplace Transform

**29.1.1** $$f(s)=\mathscr{L}\{F(t)\}=\int_0^\infty e^{-st}F(t)dt$$

$F(t)$ is a function of the real variable $t$ and $s$ is a complex variable. $F(t)$ is called the original function and $f(s)$ is called the image function. If the integral in 29.1.1 converges for a real $s=s_0$, i.e.,

$$\lim_{\substack{A\to 0\\ B\to\infty}}\int_A^B e^{-s_0t}F(t)dt$$

exists, then it converges for all $s$ with $\mathscr{R}s>s_0$, and the image function is a single valued analytic function of $s$ in the half-plane $\mathscr{R}s>s_0$.

### Two-dimensional Laplace Transform

**29.1.2**

$$f(u,v)=\mathscr{L}\{F(x,y)\}=\int_0^\infty\int_0^\infty e^{-ux-vy}F(x,y)dxdy$$

### Definition of the Unit Step Function

**29.1.3** $$u(t)=\begin{cases}0 & (t<0)\\ \frac{1}{2} & (t=0)\\ 1 & (t>0)\end{cases}$$

In the following tables the factor $u(t)$ is to be understood as multiplying the original function $F(t)$.

## 29.2. Operations for the Laplace Transform[1]

| | *Original Function F(t)* | *Image Function f(s)* |
|---|---|---|
| **29.2.1** | $F(t)$ | $\int_0^\infty e^{-st}F(t)dt$ |
| | **Inversion Formula** | |
| **29.2.2** | $\frac{1}{2\pi i}\int_{c-i\infty}^{c+i\infty}e^{ts}f(s)ds$ | $f(s)$ |
| | **Linearity Property** | |
| **29.2.3** | $AF(t)+BG(t)$ | $Af(s)+Bg(s)$ |
| | **Differentiation** | |
| **29.2.4** | $F'(t)$ | $sf(s)-F(+0)$ |
| **29.2.5** | $F^{(n)}(t)$ | $s^nf(s)-s^{n-1}F(+0)-s^{n-2}F'(+0)-\ldots-F^{(n-1)}(+0)$ |
| | **Integration** | |
| **29.2.6** | $\int_0^t F(\tau)d\tau$ | $\frac{1}{s}f(s)$ |
| **29.2.7** | $\int_0^t\int_0^\tau F(\lambda)d\lambda d\tau$ | $\frac{1}{s^2}f(s)$ |
| | **Convolution (Faltung) Theorem** | |
| **29.2.8** | $\int_0^t F_1(t-\tau)F_2(\tau)d\tau=F_1*F_2$ | $f_1(s)f_2(s)$ |
| | | **Differentiation** |
| **29.2.9** | $-tF(t)$ | $f'(s)$ |
| **29.2.10** | $(-1)^nt^nF(t)$ | $f^{(n)}(s)$ |

## 29.3. Table of Laplace Transforms[2, 3]

For a comprehensive table of Laplace and other integral transforms see [29.9]. For a table of two-dimensional Laplace transforms see [29.11].

| | $f(s)$ | $F(t)$ |
|---|---|---|
| **29.3.1** | $\frac{1}{s}$ | $1$ |
| **29.3.2** | $\frac{1}{s^2}$ | $t$ |

---

[2] The numbers in bold type in the $f(s)$ and $F(t)$ columns indicate the chapters in which the properties of the respective higher mathematical functions are given.

## 29.4. Table of Laplace-Stieltjes Transforms[4]

| | $\phi(s)$ | | $\Phi(t)$ |
|---|---|---|---|
| **29.4.1** | $\int_0^\infty e^{-st}d\Phi(t)$ | | $\Phi(t)$ |
| **29.4.2** | $e^{-ks}$ | $(k>0)$ | $u(t-k)$ |
| **29.4.3** | $\frac{1}{1-e^{-ks}}$ | $(k>0)$ | $\sum_{n=0}^{\infty} u(t-nk)$ |
| **29.4.4** | $\frac{1}{1+e^{-ks}}$ | $(k>0)$ | $\sum_{n=0}^{\infty} (-1)^n u(t-nk)$ |
| **29.4.5** | $\frac{1}{\sinh ks}$ | $(k>0)$ | $2\sum_{n=0}^{\infty} u[t-(2n+1)k]$ |
| **29.4.6** | $\frac{1}{\cosh ks}$ | $(k>0)$ | $2\sum_{n=0}^{\infty} (-1)^n u[t-(2n+1)k]$ |
| **29.4.7** | $\tanh ks$ | $(k>0)$ | $u(t)+2\sum_{n=1}^{\infty} (-1)^n u(t-2nk)$ |
| **29.4.8** | $\frac{1}{\sinh (ks+a)}$ | $(k>0)$ | $2\sum_{n=0}^{\infty} e^{-(2n+1)a}u[t-(2n+1)k]$ |
| **29.4.9** | $\frac{e^{-hs}}{\sinh (ks+a)}$ | $(k>0, h>0)$ | $2\sum_{n=0}^{\infty} e^{-(2n+1)a}u[t-h-(2n+1)k]$ |
| **29.4.10** | $\frac{\sinh (hs+b)}{\sinh (ks+a)}$ | $(0<h<k)$ | $\sum_{n=0}^{\infty} e^{-(2n+1)a}\{e^b u[t+h-(2n+1)k]$ $-e^{-b}u[t-h-(2n+1)k]\}$ |
| **29.4.11** | $\sum_{n=0}^{\infty} a_n e^{-k_n s}$ | $(0<k_0<k_1<\ldots)$ | $\sum_{n=0}^{\infty} a_n u(t-k_n)$ |

For the definition of the Laplace-Stieltjes transform see [29.7]. In practice, Laplace-Stieltjes transforms are often written as ordinary Laplace transforms involving Dirac's delta function $\delta(t)$. This "function" may formally be considered as the derivative of the unit step function, $du(t)=\delta(t)\,dt$, so that $\int_{-\infty}^{x} du(t)=\int_{-\infty}^{x}\delta(t)dt=\begin{cases}0 & (x<0)\\ 1 & (x>0).\end{cases}$ The correspondence **29.4.2**, for instance, then assumes the form $e^{-ks}=\int_0^\infty e^{-st}\delta(t-k)dt$.

# Index of Notations

Page
$(a)_n$ $=\Gamma(a+n)/\Gamma(a)$ (Pochhammer's symbol) 256
$a_r(q)$ characteristic value of Mathieu's equation 722
$A(x)$ $=2P(x)-1$ normal probability function 931
Ai$(z)$ Airy function 446
A.G.M. arithmetic-geometric mean 571
am $z$ amplitude of the complex number $z$ 16
antilog antilogarithm ($\log^{-1}$) 89
arcsin $z$, arccos $z$ inverse circular functions 79
arctan $z$, arccot $z$
arcsec $z$, arccsc $z$
arcsinh $z$, arccosh $z$ inverse hyperbolic functions 86
arctanh $z$, arccoth $z$
arcsech $z$, arccsch $z$
arg $z$ argument of $z$ 16
$b_r(q)$ characteristic value of Mathieu's equation 722
$B_n$ Bernoulli number 804
$B_n(x)$ Bernoulli polynomial 804
ber$_\nu x$, bei$_\nu x$, Kelvin functions 379
Bi$(z)$ Airy function 446
cd, sd, nd Jacobian elliptic functions 570
c.d.f. cumulative distribution function 927
$ce_r(z, q)$ Mathieu function 725
cn Jacobian elliptic function 569
Cn, Dn, Sn integrals of the squares of Jacobian elliptic functions 576
cs, ds. ns Jacobian elliptic functions 570
$C(x)$ Fresnel integral 300
$C_n(x)$ Chebyshev polynomial of the second kind 774
$C(x, a)$ generalized Fresnel integral 262
$Ce_r(z, q)$ modified Mathieu function 732
$C_1(z)$, $C_2(z)$ Fresnel integrals 300
$C_n^{(\alpha)}(x)$ ultraspherical (Gegenbauer) polynomial 774
Chi$(z)$ hyperbolic cosine integral 231
Ci$(z)$ cosine integral 231
Cin$(z)$ cosine integral 231
Cinh$(z)$ hyperbolic cosine integral 231
colog cologarithm 89
covers $A$, coversine $A$ 78
dc, nc, sc Jacobian elliptic functions 570
dn$=\Delta(\varphi)$ delta amplitude (Jacobian elliptic function) 569
$D_\nu(x)$ parabolic cylinder function (Whittaker's form) 687
$e_1$, $e_2$, $e_3$ roots of a polynomial (Weierstrass form) 629
$e^z$ exponential function 69
$e_n(z)$ truncated exponential function 262
$E(\varphi\backslash\alpha)$ elliptic integral of the second kind 589
$E(a,x)$ parabolic cylinder function 693
$\mathbf{E}_\nu(z)$ Weber's function 498
$E_\nu^{(m)}(z)$ Weber parabolic cylinder function 509
$E(m)$ complete elliptic integral of the second kind 590
Ei$(x)$ exponential integral 228
$E_1(z)$ exponential integral 228
$E[g(X)]$ expected value operator for the function $g(x)$ 928
Ein$(z)$ modified exponential integral 228
$E_n$ Euler number 804
$E_n(x)$ Euler polynomial 804
$E_n(z)$ exponential integral 228
erf $z$ error function 297
erfc $z$ complementary error function 297
exp $z=e^z$ exponential function 69
exsec $A$, exsecant $A$ 78
$f_{e,r}$, $f_{o,r}$ joining factors for Mathieu functions 735
$F(a, b; c; z)$ hypergeometric function 556
$F(\varphi\backslash\alpha)$ elliptic integral of the first kind 589
$F_L(\eta,\rho)$ Coulomb wave function (regular) 538
FPP fundamental period parallelogram 629
${}_nF_m(a_1, \ldots, a_n; b_1, \ldots, b_m; z)$ generalized hypergeometric function 556
$g_2$, $g_3$ invariants of Weierstrass elliptic functions 629
$g_{e,r}$, $g_{o,r}$ joining factors for Mathieu functions 740
$g(x, y, \rho)$ bivariate normal probability function 936
Gi$(z)$ related Airy function 448
$G_L(\eta, \rho)$ Coulomb wave function (irregular or logarithmic) 538
$G_n(p, q, x)$ Jacobi polynomial 774
gd$(z)$ Gudermannian 77
$h_n^{(i)}(z)$ spherical Bessel function of the third kind 437
hav $A$ haversine $A$ 78
$\mathbf{H}_\nu(z)$ Struve's function 496
Hi$(z)$ related Airy function 448
$He_n(z)$ Hermite polynomial 775
$H_\nu^{(n)}(z)$ Bessel function of the third kind (Hankel) 358
$Hh_n(x)$ $Hh$ (probability) function 300, 691
$H_n(x)$ Hermite polynomial 775
$H(m, n, x)$ confluent hypergeometric function 695
$I_\nu(z)$ modified Bessel function 374
$\sqrt{\frac{1}{2}\pi/z}I_{n+\frac{1}{2}}(z)$ modified spherical Bessel function of the first kind 443
$\sqrt{\frac{1}{2}\pi/z}I_{-n-\frac{1}{2}}(z)$ modified spherical Bessel function of the second kind 443
$I(u, p)$ incomplete gamma function (Pearson's form) 262
$I_x(a, b)$ incomplete beta function 263
$\mathscr{I}z$ imaginary part of $z(=y)$ 16
i$^n$ erfc $z$ repeated integral of the error function 299
$j_n(z)$ spherical Bessel function of the first kind 437
$\mathbf{J}_\nu(z)$ Anger's function 498
$J_\nu(z)$ Bessel function of the first kind 358
$k$ modulus of Jacobian elliptic functions 590
$k'$ complementary modulus 590
$k_\nu(z)$ Bateman's function 510

Page
$\mathrm{Ki}_r(z)$ repeated integrals of $K_0(z)$ 483
$\sqrt{\frac{1}{2}\pi/z}\,K_{n+\frac{1}{2}}(z)$ modified spherical Bessel function of the third kind 443
$K_\nu(z)$ modified Bessel function 374
$K(m)$ complete elliptic integral of the first kind 590
$\mathrm{ker}_\nu x$, $\mathrm{kei}_\nu x$ Kelvin functions 379
$\mathrm{li}(x)$ logarithmic integral 228
lim limit 13
$\log_{10}x$ common (Briggs) logarithm 68
$\log_a z$ logarithm of $z$ to base $a$ 67
$\ln z\ (=\log_e z)$ natural, Naperian or hyperbolic logarithm 68
$\mathscr{L}[F(t)]=f(s)$ Laplace transform 1020
$L(h, k, \rho)$ cumulative bivariate normal probability function 936
$L_n(x)$ Laguerre polynomial 775
$L_n^{(\alpha)}(x)$ generalized Laguerre polynomial 775
$\mathbf{L}_\nu(z)$ modified Struve function 498
$m=\mu_1'$ mean 928
$m$ parameter (elliptic functions) 569
$m_1$ complementary parameter 569
$M(a, b, z)$ Kummer's confluent hypergeometric function 504
$Mc_r^{(j)}(z, q)$ modified Mathieu function 733
$Ms_r^{(j)}(z, q)$ modified Mathieu function 733
$M_{\kappa,\mu}(z)$ Whittaker function 505
$n$ characteristic of the elliptic integral of the third kind 590
$O(v_n)=u_n$, $u_n$ is of the order of $v_n$ ($u_n/v_n$ is bounded) 15
$o(v_n)=u_n$, $\lim\limits_{n\to\infty}\frac{u_n}{v_n}=0$ 259
$O_n(z)$ Neumann's polynomial 363
$p(n)$ number of partitions 825
$\wp(z)$ Weierstrass elliptic function 629
ph $z$ phase of the complex number $z$ 16
$P(a,x)$ incomplete gamma function 260
$P(\chi^2|\nu)$ probability of the $\chi^2$-distribution 262, 940
$P_\nu^\mu(z)$ associated Legendre function of the first kind 332
$P(x)$ normal probability function 931
$P_n(z)$ Legendre function (spherical polynomials) 333, 774
$P_n^*(x)$ shifted Legendre polynomial 774
$P_n^{(\alpha,\beta)}(x)$ Jacobi polynomial 774
$Pr\{X\le x\}$ probability of the event $X\le x$ 927
$q$ nome 591
$Q(x)=1-P(x)$ normal probability function (tail area) 931
$q(n)$ number of partitions into distinct integer summands 825
$Q_\nu^\mu(z)$ associated Legendre function of the second kind 332
$Q_n(x)$ Legendre function of the second kind 334
$\mathscr{R}\,z$ real part of $z(=x)$ 16
$R_{mn}^{(p)}(c, \xi)$ radial spheroidal wave function 753
$S_n^{(m)}$ Stirling number of the first kind 824
$\mathfrak{S}_n^{(m)}$ Stirling number of the second kind 824
$se_r(z, q)$ Mathieu function 725
sn Jacobian elliptic function 569
$S(z)$ Fresnel integral 300
$S_1(z)$, $S_2(z)$ Fresnel integrals 300
$Se_r(z, q)$ modified Mathieu function 733
$S(x, a)$ generalized Fresnel integral 262
$\mathrm{Shi}(z)$ hyperbolic sine integral 231
$\mathrm{Si}(z)$ sine integral 231
$S_n(x)$ Chebyshev polynomial of the first kind 774
$\mathrm{Sih}(z)$ hyperbolic sine integral 231
$S_{mn}^{(p)}(c, \eta)$ angular spheroidal wave function 753
$\mathrm{si}(z)$ sine integral 232
$\sin z$, $\cos z$, $\tan z$ circular functions 71
$\cot z$, $\sec z$, $\csc z$ 72
$\sinh z$, $\cosh z$, $\tanh z$ hyperbolic functions 83
$\coth z$, $\mathrm{sech}\,z$, $\mathrm{csch}\,z$ 83
$T(m, n, r)$ Toronto function 509
$T_n(x)$ Chebyshev polynomial of the first kind 774
$T_n^*(x)$ shifted Chebyshev polynomial of the first kind 774
$U(a, b, z)$ Kummer's confluent hypergeometric function 504
$U_n(x)$ Chebyshev polynomial of the second kind 774
$U_n^*(x)$ shifted Chebyshev polynomial of the second kind 774
$U(a, x)$ Weber parabolic cylinder function 687
$\mathrm{vers}\,A$, versine $A$ 78
$V(a, x)$ Weber parabolic cylinder function 687
$w(z)$ error function 297
$W(a, x)$ Weber parabolic cylinder function 692
$W_{\kappa,\mu}(z)$ Whittaker function 505
$W\{f(x), g(x)\}(=f(x)g'(x)-f'(x)g(x))$ Wronskian relation 505
$[x_0, x_1, \ldots, x_k]$ divided difference 877
$y_n(z)$ spherical Bessel function of the second kind 437
$Y_\nu(z)$ Bessel function of the second kind 358
$Y_n^m(\theta, \varphi)$ surface harmonic of the first kind 332
$Z(x)$ normal probability density function 931

# Notation — Greek Letters

| | Page |
|---|---|
| $\alpha$ modular angle (elliptic function) | 590 |
| $\alpha_n(z) \;=\int_1^\infty t^n e^{-zt}dt$ | 228 |
| $\beta_n(z) \;=\int_{-1}^1 t^n e^{-zt}dt$ | 228 |
| $\beta(n) \;=\sum_{k=0}^\infty (-1)^k(2k+1)^{-n}$ | 807 |
| $B_x(a, b)$ incomplete beta function | 263 |
| $B(z, w)$ beta function | 258 |
| $\gamma$ Euler's constant | 255 |
| $\gamma(a, x)$ incomplete gamma function (normalized) | 260 |
| $\gamma_1=\frac{\mu_3}{\sigma_3}$ coefficient of skewness | 928 |
| $\gamma_2=\frac{\mu_4}{\sigma^4}-3$ coefficient of excess | 928 |
| $\Gamma(z)$ gamma function | 255 |
| $\Gamma(a, x)$ incomplete gamma function | 260 |
| $\delta_{ij}$ Kronecker delta $(=0$ if $i\neq k$; $=1$ if $i=k)$ | 822 |
| $\delta_n^k(f_n)$ central difference | 877 |
| $\Delta$ difference operator | 822 |
| $\Delta$ discriminant of Weierstrass' canonical form | 629 |
| $\Delta(f_n)$ forward difference | 877 |
| $\Delta x$ absolute error | 14 |
| $\zeta(x)$ Riemann zeta function | 807 |
| $\zeta(z)$ Weierstrass zeta function | 629 |
| $Z(u \mid m)$ Jacobi's zeta function | 578 |
| $\eta(n) \;=\sum_{k=1}^\infty (-1)^{k-1}k^{-n}$ | 807 |
| $\eta_a \;=\zeta(\omega_a)$ Weierstrass elliptic function | 631 |
| $\mathrm{H}(u)$, $\mathrm{H}_1(u)$ Jacobi's eta function | 577 |
| $\vartheta_n(z)$ theta function | 576 |
| $\vartheta_c(\epsilon\backslash\alpha), \vartheta_d(\epsilon\backslash\alpha),$ $\vartheta_n(\epsilon\backslash\alpha), \vartheta_s(\epsilon\backslash\alpha)$ Neville's notation for theta functions | 578 |
| $\Theta(u \mid m)$ Jacobi's theta function | 577 |
| $\kappa_n$ $n$th cumulant | 928 |
| $\kappa_{mn}^{(p)}$ joining factor for spheroidal wave functions | 757 |
| $\lambda(n)=\sum_{k=0}^\infty (2k+1)^{-n}$ | 807 |
| $\lambda_{mn}$ characteristic value of the spheroidal wave equation | 753 |
| $\Lambda_0(\varphi\backslash\alpha)$ Heuman's lambda function | 595 |
| $\mu(f_n)$ mean difference | 877 |
| $\mu(n)$ Möbius function | 826 |
| $\mu_n$ $n$th central moment | 928 |
| $\mu'_n$ $n$th moment about the origin | 928 |
| $\pi(x)$ number of primes $\leq x$ | 231 |
| $\pi_n(x)=(x-x_0)(x-x_1)\ \ldots\ (x-x_n)$ | 878 |
| $\Pi(n;\varphi\backslash\alpha)$ elliptic integral of the third kind | 590 |
| $\Pi(z)$ factorial function | 255 |
| $\rho$ correlation coefficient | 936 |
| $\rho_n(x_0, x_1, \ldots, x_n)$ reciprocal difference | 878 |
| $\rho_n(\nu, x)$ Poisson-Charlier function | 509 |
| $\sigma$ standard deviation | 298 |
| $\sigma^2$ variance | 928 |
| $\sigma(z)$ Weierstrass sigma function | 629 |
| $\sigma_k(n)$ divisor function | 827 |
| $\tau_n(x)$ tetrachoric function | 934 |
| $\varphi=\mathrm{am}\, u$, amplitude | 569 |
| $\varphi(n)$ Euler-Totient function | 826 |
| $\varphi(t)=E(e^{itX})$ characteristic function of $X$ | 928 |
| $\Phi(a; b; z)$ confluent hypergeometric function | 504 |
| $\psi(z)$ logarithmic derivative of the gamma function | 258 |
| $\Psi(a; c; z)$ confluent hypergeometric function | 504 |
| $\omega_a$ period of Weierstrass elliptic functions | 629 |
| $\omega_{\kappa,\mu}(x)$ Cunningham function | 510 |
